Notably, Sansovino's list includes Guicciardini but not Machiavelli (possibly to avoid censorship). In fact, Sansovino's appreciation for Machiavelli dates back to his juvenile manuscript *Dialogo della pratica della ragione* (see Scarpa 1980; Sartorello 2010); and in the *Concetti* the polygraph was largely indebted to both him and Guicciardini, deriving more than one-third of his aphorisms from their works. In fact, the selection made by Sansovino has been considered by Vincent Luciani an accurate reduction of Guicciardini's and Machiavelli's thought (as known in those days), although conveyed in maxims (Luciani 1950, 1952). Thanks to Hitchcock's faithful translation of the *Concetti*, Sansovino helped to spread the ideas of both writers within the Elizabethan court and among English readers (Luciani 1952, 839). Furthermore, scholars in the last decades have pointed out the early connection made by Sansovino between Machiavelli and Aristotle, anticipating what would have later become a very popular interpretation of Machiavelli's thought (Scarpa 1980; Figorilli 2011; Lepri 2016).

The publication in 1561 of *Del governo dei regni et delle repubbliche* is probably best put in relation to the cultural goals pursued by the Accademia Veneziana, which had been dismissed in the same year. The academy, in fact, had developed an editorial program that included a series of publications about politics. Some of the subjects considered in the *Governo* are actually mentioned in that program (Testa 2015, pp 109–111; Marx 1993).

The work, reedited four times before 1600, consists of 18 books (increased to 21 in 1567 and to 22 in 1583). In each book, Sansovino depicts the political structure of a government, first dealing with all kingdoms and then with all republics. He mostly describes offices and institutions but also occasionally considers other factors, including climate, territory, customs, and administrative history.

As in the *Concetti politici*, Sansovino extracts, translates, and adapts his descriptions from a number of works. These are declared in the

editio princeps, but – again – omitted in all later editions. Moreover, in an autobiographical letter to Filippo Magnanini, dated 1579 and attached at the end of his *Secretario* (Sansovino 1564, fol. 220v), he mentions both the *Governo* and the *Concetti* not as compilations but as original works. Though he might be accused of plagiarism for this, it is true that the *Governo* includes three original contributions authored by Sansovino; he wrote in fact the descriptions of Ragusa (Dubrovnik), Genoa – both in the editorial plans of the Accademia Veneziana – and Lucca. By accounting also for the geography, customs, and history of these cities, his descriptions follow the pattern of sixteenth-century diplomatic reports, a pattern that was later confirmed in Giovanni Botero's *Relazioni universali* (1591) and that became very successful in seventeenth-century publishing (Carta 2007; Frigo 1992).

In the *Governo*, Sansovino enters the political debate over the dualism reign/republic. His point of view is that a good administration rests on the right combination of its institutions and a good balancing of offices and powers. He, therefore, supports a moderate government, whose best expression he recognizes in Venice. He also insists on the moral integrity of the citizens and on the importance of Roman republican *virtus*, praising the straight and simple customs of the Swiss Republics and of the city of Ragusa (Frigo 1992).

The comparative approach applied to the analysis of the institutions – a methodology later ratified by Jean Bodin – and the practical intent of the work are probably the most interesting features in Sansovino's *Governo*. In fact, Sansovino does not present the structure of an ideal society but rather provides examples of government and public administration for rulers who want to improve their own statecraft and for anyone else who, even without a solid background, would like to enter the political and administrative activity with the necessary knowledge (Grendler 1969; Frigo 1992; Rossi 2014).

As a result, one could say that Sansovino, though he added little to debates taking place in those years, still played a key role in organizing

political thought in his final decades and in disseminating it for the benefit of a broader public. The *Governo* and the *Concetti* were part of a process that became a very typical feature of late sixteenth-century publishing in many fields, a process fully embodied by Sansovino's lifework: the popularization of culture, which through guides, manuals, treatises, compilations, and translations aimed to make centuries of knowledge accessible to non-specialists.

Abstract

With *The History of the Council of Trent*, published in London in 1619, the Venetian Paolo Sarpi established himself as both the

greatest Italian historian in the seventeenth century and the most formidable adversary of the Counter-Reformation in Italy. His life changed decisively in 1606 when Pope Paul V laid Venice under the Interdict. A friar in the order of the Servants of Mary, Sarpi was a staunch defender of the Republic, playing a key role in the “war of words” that lasted for a whole year between the two contenders, much to the amazement of the major European men of letters and rulers. He was 54 when he first entered the political scene and began writing for the press. Prior to that, he had concentrated on philosophical and scientific studies. In his *Thoughts* he discussed in the form of notes and aphorisms the most current themes of the scientific revolution; he also offered a disillusioned review of the natural and human world, reappraising with radical skepticism the development of society and religion. The Interdict made him venture onto the field of politics and history, and this engrossed him more and more for the rest of his life. Writing thus became for Sarpi an instrument of political warfare to defend the sovereignty of the State and a means for a controversial reconstruction of the history of the Roman Church.

Biography

Born in Venice in August 1552, Pietro Sarpi changed his baptismal name to Paolo in 1565, when he joined the order of the Servants of Mary in the Venetian convent of S. Maria. The son of a Venetian mother and a merchant from Friuli who died at a young age, he was educated in grammar and rhetoric by his maternal uncle who was a priest in the parish of San Marcuola. He then attended lessons in logic and philosophy held by Giovanni Maria Capella from Cremona, a friar from the Servants and an expert on Duns Scotus. Pietro’s religious decision as an adolescent was probably a result of Capella’s influence. Sarpi continued his studies in the Observant convents in Cremona, where probably he took his vows in 1572, and in Mantua. Thanks to the presence of Jewish scholars from the Gonzaga court, it was

here that he was able to further his studies of Hebrew and sustained successful public discussions on philosophical and theological theses, obtaining his baccalaureate in 1574. Archbishop Carlo Borromeo invited him to Milan, but he did not remain there long. In 1575 he was already back in the convent in Venice teaching philosophy, and in 1578 he was awarded the degree of doctor in theology at Padua University (Micanzio 1974; Cozzi 1979; Branchesi 2006). In the same year, he began writing notes on scientific and philosophical subjects, called *Thoughts* (Cozzi and Sosio 1996). His career in the order progressed rapidly: the provincial in Venice from 1579 to 1582 and procurator-general in the Apostolic See from 1585 to 1588, the second-highest post in the order after the prior general. In Rome, he initially attracted the admiration of the cardinal protector of the Servants of Mary, Giulio Antonio Santoro, as well as of Pope Sixtus V, but he also frequented more marginal or dissenting figures such as the Jesuits Nicolás de Bobadilla and Robert Bellarmine and Cardinal Giovan Battista Castagna, who was to become Pope Urban VII. As can be seen in the *Thoughts* he wrote in this period, he continued to cultivate his mathematical and theoretical interests. On a trip to Naples, he visited Giambattista Della Porta whom he might have already met in Padua. Although there is no clear documentation, he could have met the mathematician from the Roman College, Cristoforo Clavio, and might have collaborated in the complex undertaking of transporting the Vatican obelisk (Cozzi and Sosio 1996, XLI). However, he was later to have a very negative memory of the contact he had with the Roman Curia, at a moment in which considerable measures were taken to reinforce the Counter-Reformation Church. Once his term as the procurator-general had finished, his rise up to the top of the order came to an end.

Back in Venice, he returned to his studies with renewed vigor, intensifying his relations with the political-cultural circles of the capital and the university city. He participated in meetings that took place at the house of the patricians Andrea and Nicolò Morosini – in which Giordano Bruno also

took part in 1592 – and at Gian Vincenzo Pinelli's home in Padua, a reference point for Venetian patricians, university professors, and clergymen with both classical-humanistic and scientific interests. Here he met the mathematician Marino Ghetaldi from Ragusa and Galileo Galilei with whom he held discussions about optics and dynamics (Cozzi 1979; Cozzi and Sosio 1996; Bucciantini 2000). His network of contacts – not yet studied in detail – also included physicians and anatomists: Girolamo Fabrici d'Acquapendente and Santorio Santorio, both university professors in Padua, and Pierre Asselineau, a French Calvinist and probably the go-between for Sarpi's relations with the French ambassadors André de Maisse and Philippe Canaye de Fresnes. The latter, in turn, both aided Sarpi's correspondence with Isaac Casaubon and Jacques-Auguste De Thou (Cozzi 1979). At the end of the 1580s, he also began to be a frequent visitor at the mercers' shop at the Golden Ship, run by Dutch Calvinists, which was a meeting place for foreign merchants and travelers and a crossroad for news from all over the world. At the beginning of the seventeenth century, Sarpi was therefore a friar with multiple skills and an authoritative interlocutor with men of science, noblemen, and foreign diplomats, curious about the novelties of contemporary politics (De Vivo 2006). He was, however, also a friar who was becoming increasingly ill at ease in his order, now divided into factions by the forceful intervention of cardinal protector Santoro, who had become his open enemy (Barzazi 2012). To escape these disputes, Sarpi asked the government for support twice, once in 1600 and again in 1601, to be appointed bishop of a minor Veneto bishopric. Paul V refused his request both times. The doubts the papal nuncio in Venice expressed about his own religious beliefs did not help him at all.

In April 1606 the tension overshadowing the relations between the Venetian Republic and the papacy exploded: Paul V ordered the senate to repeal several laws aimed at limiting the acquisition of property by the Church and the detention of two delinquent clerics. Faced with a refusal, Paul V proclaimed the excommunication of the

Doge and of the Venetian leaders and the Interdict of the entire dominions of the Republic, prohibiting the clergy from celebrating any religious functions and sacraments. By the end of January, Sarpi had already been appointed consultant in theological matters and canon laws, which was a new office in the Venetian government system. It was in this role that he drafted the “protest,” the official reply signed by the Doge, which declared the Roman censures invalid and unlawfully proclaimed and ordered the clergy to continue their church services as usual. During the following months, he organized the Venetian resistance to the attacks from polemicists in Rome such as Baronio and Bellarmine, writing pieces of advice for the senate and pamphlets that were to be broadly diffused in both Italy and Europe (Pin 2001; Tutino 2010; De Vivo 2007).

The diplomatic settlement of the controversy, achieved thanks to French mediation in April 1607, left him both disappointed and in an awkward position. In October of the same year, he was injured in an assault that was said to have been carried out by circles close to Paul V; in vain, emissaries of the Roman Curia and even the general of the order tried to convince him to submit to Paul V (Barzani 2006). His role as a consultant became less important. Considered a troublesome figure in the more moderate groups of the ruling class, he was summoned very rarely by the senate in the two years following the Interdict and only on matters that were of little significance (Pin 2006b). Progressively isolated from Venetian politics, Sarpi was, however, at the center of attention of European political and religious circles. They regarded him as essential in their plans to counteract Italian politics dominated by the axis between the papacy and Spain. Their scheme was the formation of a vast confederation of countries from the north of Europe and France under Henry IV, which would ideally make in post-Interdict Venice its possible base. Sarpi tried to support these plans and acted accordingly with the patricians he was closest to, while also taking independent initiatives. Together with the brother and future biographer Fulgenzio Micanzio, he made contact with the chaplain of the English embassy in Venice, William Bedell. He entered

into correspondence with outstanding figures in the Gallican world – Jacques-Auguste De Thou, Jacques Leschassier, and Jacques Gillot – and with French, Swiss, and German Calvinists such as Jérôme Grosloot de l’Isle, Philippe Du Plessis Mornay, Jean Hotman de Villiers, Jean Diodati, and Christoph and Achatius von Dohna. He expressed his aversion to the Apostolic See freely – to the Protestants in particular – voicing his hopes that the papacy’s incumbent presence and the supremacy of Habsburgs’ Spain would be brought down by a clash with the powers on the other side of the Alps (Busnelli 1931; Ulianich 1961; Cozzi 1979). It is unclear whether these clandestine ties were simply aimed at giving the Venetian Republic an influential role alongside the political and economic powers of the north or were also intended to remove the Venetian Church from Rome. In the summer of 1609, agents of the Protestant Union of Halle and the United Provinces of the Netherlands arrived in Venice, but the correspondents were by then disappointed with Sarpi’s excessive caution in taking any action. Any hopes of a great political-religious upheaval were dashed when Henry IV was assassinated in 1610. However, Sarpi’s letters to the Gallicans and the Protestants continued until 1612, successively becoming less frequent before ceasing altogether in 1616–1617. From 1612 he was equally in touch with the English ambassador in Venice, Dudley Carleton, with whom he exchanged letters till 1615, when Carleton had already moved to the Netherlands. At the same time, Micanzio, for his part, entered into correspondence with the latter as well as with William Cavendish, son of the Earl of Devonshire. Thomas Hobbes, Cavendish’s tutor, translated Micanzio’s letters from Italian into English (Cozzi and Cozzi 1969/1997; Barzani 2010).

It was from 1609 to 1610 that Sarpi’s role in the Venetian government was gradually consolidated and his activity as a consultant was intensified. The range of the issues he was asked to examine expanded, going beyond the ecclesiastic and jurisdictional fields – controversies on church benefices and clerical immunity, disputes regarding the Inquisition, the press and censorship, and

relationships with the Greek and Jewish communities – to those of more strictly political importance: regulating ecclesiastic and lay fiefs, border conflicts, dominion over the Adriatic Sea, international relations, and foreign policy. Some pieces of advice were in the form of short treatises regarding specific subjects, for example, *On the Office of the Inquisition* (1613), *On the Immunity of the Churches* (1620), or *Jurisdiction in the Patriarchs' Lands of Friuli* (1621), in which Sarpi denounced the faults of the Republic in arousing the controversy over the feudal rights of the Aquileian Patriarchate (Gambarin 1958; Pin 1985). The new position of the consultant meant compromise and mediation. During the eve and outbreak of the Thirty Years War (1618–1648) – a very difficult period for Venice – Sarpi's relations with the ruling class had their ups and downs. In fact, those patricians who supported the anti-Habsburg line and a more decisive stance toward the Church found themselves up against a prevailing pacifistic and moderate tendency. However, Sarpi's counsel was in considerable demand, and in the last two years of his life, he even presented to the senate as many as two pieces of advice a week (Pin 2006b, p. 357).

Committed to replying day in, day out to the questions of the Venetian government, he did not completely abandon his scientific studies and philosophical meditations. In 1609 he collaborated with Galileo in developing the telescope (Bucciantini 2000). In the following years, he had his *Thoughts on Religion* transcribed; he also continued to record his astronomic observations and calculations (Cozzi and Sosio 1996). He was, however, more focused on history. From 1607 onward, in response to solicitations from J.-A. De Thou, he wrote the *History of the Interdict*, which he completed under the supervision of Doge Leonardo Donà (Pin 2006a); he also composed the *Treatise on Benefices*, an extensive study on the revenues' regime in the Church (Gambarin 1958). In the same period, the project on the history of the Council of Trent began to take shape. In a letter dated March 1608 to J. Gillot, Sarpi said he already had a considerable amount of documentation on the council, both originals and copies. Perhaps already started in

1611 (Pin 2006b, p. 393), most of the *History of the Council of Trent* was written between 1614 and the beginning of 1616 before being finally completed in 1617. These developments were followed with particular attention by the English ambassador D. Carleton as well as by King James I, who invited Sarpi to move to London more than once. It was the archbishop of Canterbury, George Abbot, who organized the publication of the *History*: in the spring of 1618, one of his fiduciaries had the manuscript transcribed in Venice and sent it to England, one gathering after the other, using the commercial network run by Daniel Nis, a Dutch merchant who lived in Venice and an old friend of Sarpi's. In May 1619 the work was published in London by the printer John Bill with the pseudonym Pietro Soave Polano, an anagram of the author's name (Paolo Sarpi Veneto), with a subtitle and a dedication to James I, both added by Marc'Antonio De Dominis. The author was extremely annoyed by the additions. In November the *History* was placed on the Index (Cozzi and Cozzi 1969/1997). In the meantime, Sarpi had been asked to write other historical works by the Venetian government, engaged in the unsuccessful war against the Habsburg archdukes of Austria on the eastern borders in 1615–1616 and in the following diplomatic negotiations. He penned the *Addition* and the *Supplement* to the *History of the Uskoks* by M. Minucci (1617–1618) and the unfinished *Treatise of Peace and Settlement*, likened to *The History of the Council of Trent* owing to its lucid analysis and rigorous argumentation (Cozzi and Cozzi 1965, 1969/1997, p. 1022).

Sarpi died on 15 January 1623 in the Venetian convent of S. Maria dei Servi. The senate made Micanzio compile an official report on his death. The faithful brother wrote that he had died at peace and with the comfort of the sacraments (Cozzi 1979; Barzazi 2010). The public funeral rites were celebrated amid fervent protests from the papal nuncio. The *corpus* containing more than one thousand pieces of advice by Sarpi was transcribed into large parchment volumes and deposited in the secret chancellery to be used by the Venetian magistracies and by his successors in the office of the consultant.

Works and Themes

“Even before the events of the world induced me to think about serious things [...] my natural inclination was already towards the natural and mathematical subjects,” Sarpi wrote to Jérôme Grosloot de l’Isle in July 1608 (Busnelli 1931, I, 22). The long-lasting attraction that most current scientific themes in the late sixteenth and early seventeenth century had for him can be seen in his *Natural, Metaphysical and Mathematical Thoughts*, an extensive *corpus* with 655 notes, which survived only in eighteenth-century copies. Not intended for publication, these notes are actually an intellectual diary, most of which were written between 1578 and 1597 and also continued until the beginning of the 1620s (Cozzi and Sosio 1996). In the series of *Thoughts* dating back to the period between his degree in theology and the years of his provincialate, Sarpi dealt mainly with problems regarding optics: the mechanisms of vision, refraction, and the effect of light on celestial bodies, discussed on the basis of the masters of Medieval optics, Roger Bacon, Alhazen, and Witelo. Other notes are on acoustics, the propagation of heat, and local motion; he studied the latter from a philosophical and qualitative perspective, according to the approach of late Scholasticism. Sarpi also showed a keen interest in the theory of knowledge and this was to be one of the main lines of his reflections. Already in his very first *Thoughts*, he was dwelling on the uncertainty of the path that leads from sense perception to the understanding of the causes of phenomena; similarly, he took up the arguments of nominalist critics of Aristotelian science, also using corpuscular theories, drawn on Lucretius and Diogenes Laërtius and an important author in the mathematical Renaissance in the Veneto, Hero of Alexandria. His mechanistic vision became more articulate in the notes on the sense of matter, its composition, and continuous changes, believed to be the origin of all things (Wootton 1983; Frajese 1994; Cozzi and Sosio 1996). Between the provincialate and his appointment as the procurator-general of the order, Sarpi’s speculations went together with chemical experiments and dissecting animals with the aim of studying the

circulatory system and the structure of the eye in greater detail from an anatomical and physiological point of view (Micanzio 1974, pp. 1291–1294). During the three years he spent in Rome, his scientific attitude developed significantly. His *Thoughts* reflects the relations with a lively scientific milieu and his contact with the mathematical and astronomical investigations originated from the calendar reform carried out by Pope Gregory XIII. It was at this moment that Sarpi overcame the close association between optics and astronomy and began tackling cosmological problems with mechanical and quantitative reasoning, which actually also reveal a closer study of the heliocentric theories. Several great themes – motion of projectiles, acceleration and fall of bodies, and movement of the tides – all appeared in his notes. They were later to be at the center of his intense discussions with Galileo, which began just after the latter arrived in Padua in 1592 (Ernst and Canone 1994, p. 363). The correspondence between them and their writings show they agreed and disagreed on certain aspects, but Sarpi’s contribution to Galileo’s theories and inventions, as in the case of discoveries in other fields such as vein circulation and magnetism, is not specifically documented, thus resulting in conflicting interpretations (Sosio 2006). In fact, although Sarpi grasped the importance of the mathematical explanation of physical phenomena, he was never able to abandon the qualitative analysis of dynamics and the traditional scholastic instruments. Moreover, his reflections continued to cover a great variety of different fields: from optics – where he achieved the highest levels of expertise – to the states of matter, human physiology, biology, and animal metabolism. Nevertheless, he continued to read a vast range of the latest scientific works; in 1602 he commented on William Gilbert’s *De Magnete* (1600) with Galileo; in 1615 a correspondent sent him two posthumous writings by François Viète; he drafted extracts and comments on various works by Kepler, including the second edition of the *Mysterium Cosmographicum*, dated 1621 (Cozzi 1979, p. 162; Cozzi and Sosio 1996, LXXIII, CXC).

Sarpi’s criticism of the Aristotelian categories of knowledge equally remained founded mainly

on nominalism, Ockham's doctrine in particular, but he did grant Epicurean mechanistic philosophy greater room. It was on this basis that his study of sensory perception and the action of human mind gradually expanded to ethical subjects: happiness, conceived as a state of peace compared to the motion of passions, according to a stoic vision modified with references to animal behavior as described by Cynics, and the law, defined as the assumption as a rule of the habits of the majority, in a more relativistic and merely positive perspective. His reflections on the moral and political-religious world were particularly original and scathing in a dozen *Thoughts* he wrote between 1588 and 1591, after his return from Rome (Cozzi and Sosio 1996, pp. 289–320; Pin 2012). Sarpi's starting point in these was the nature of "true philosophy," which he called the "food of the soul." If, thanks to philosophy, men had been able to achieve peace of their souls – he said – they would have rather lived "in anarchy." However, as that was not possible, they had always sought the help of two "natural medicines" of human weakness and imperfection: the "republic," or political community, and the "torà," religion; the latter was designated with a Hebrew word emphasizing Sarpi's familiarity with the tradition of the Mosaic Law (Frajese 2006). The "torà" was actually a human institution, subject to change and deterioration, and was a "worldly thing," "property" of the "republic," which used it to reinforce its political power. Such opinions on the political use of religion offered nothing new and were variously discussed in the "reason of state" literature of that time. Sarpi, however, went further. He objected that it was not true that the "torà" was needed to reinforce the states and unite society, as could be seen by the fact that someone who had abandoned religion deep down did not necessarily change his behavior. The "torà" was therefore the same as any other means that generated fear and subjection in mankind, and its effectiveness would vary depending on the time and place. In fact, Sarpi concluded, "the torà is more influential in the South and the East, honour more in the North, and ambition in the countries in the Middle." Thus the ideas of ancient and modern

writers – including Lucretius, Averroes, Machiavelli, Pomponazzi, Bodin, and Montaigne – were revisited in a libertine vision that deprived religion of its most traditional function, separating it from civilization on the basis of anthropological and climatic considerations and contemplating the possibility of an atheistic society (Wootton 1983; Tuck 1993, pp. 98–99; Frajese 1994).

The research he carried out in a fragmentary form in *Natural[...]Thoughts* was developed in three short essays that were also not intended for publication and were probably written between the end of the sixteenth century and the first decade of the seventeenth. The first, known by the eighteenth-century title *The Art of Good Thinking*, is connected to Sarpi's deep interest in the structures of human knowledge, which he believed only differed from those of animals regarding quantity. In this small treatise, Sarpi analyzed the limits of cognitive processes: he classified the errors in the intellect's elaboration of data from senses; he cataloged the sources of error that were due to experience; he finally indicated the skeptic suspension of judgment as an obligatory step in view of a gradual correction of the false opinions of the intellect, which was forced to proceed by trial and error. Among the false opinions conceived by the human mind, Sarpi also included the idea of the immortality of the soul (Frajese 2006, p. 96). Probably fueled by the continuous attention he paid to the scientific explanation of natural phenomena, Sarpi's plea for methodical training of the human faculties was no more than a claim, to be developed fully by the seventeenth-century thinkers. It, therefore, prompted Sarpi's eighteenth-century apologists to suggest an unfounded comparison with Locke (Tuck 1993, p. 98; Cozzi and Sosio 1996, pp. 561–562).

The second essay, with the title – given later – *Medical-Moral Thoughts*, discussed the related subjects of happiness and taking care of the passions, inserting them into the pattern of therapeutic advice that was common in Hippocratic-Galenic medical literature. Sarpi quoted numerous classical authors – Epictetus, Plutarch, and Seneca – filtered through Montaigne's writing and Charron's *De la sagesse*, recommending to

the wise man the path of a moderate composition of pleasure and pain, which took into account the relativity of each choice and man's intrinsic fragility, avoiding any excessive rigor. Follow Socrates rather than Cato, Sarpi suggested. The message in the text could be interpreted in different ways. Indeed, some precepts expressed a lack of faith in the possibility of influencing traditional values and customs, suggesting the wise man detach himself totally from civil and political life, while other maxims prefigured the possibility of a prudent, cautious commitment, bearing in mind the limits of human action (Pin 2012).

In the philosophical notes written in 1588–1591, Sarpi had dealt with religion in its abstract social and political aspects. In his third essay, *Thoughts on Religion* – of which a copy made after 1609 survives with additional comments by the author – the subject was tackled from a different perspective. Sarpi put forward a genetic, historical analysis that used the reasoning in chapter V, book II, of Charron's *De la sagesse*, integrating it with passages from Lucretius' *De rerum natura* (Frajese 1990). In a lapidary and elliptic style, Sarpi claimed that the religious sentiment and the very idea of divinity had developed in mankind via a process of "amplification of the idea of oneself," facilitated by fear and the ignorance of the causes of natural phenomena. This process resulted in religions that rationed different "operative" and "speculative" components and that attributed different positions to God and man. Sarpi strived to identify the most suitable of these to support the action of political authorities and to satisfy the needs of both "unrefined" and more "subtle" minds. His reply was clear: the "best" religion was the one that raised God up to an extremely high sphere, distant from man in order to evoke reverence but not fear and to discourage the proliferation of rites and doctrines. In the final part of his essay, Sarpi reviewed the Greek and Roman religions, Judaism and Christianity, to conclude that the latter had originally been close to the "ideal" model previously outlined. Christianity had therefore been subjected to gradual corruption: the articles of faith had multiplied and its relationship with politics had become more difficult. In fact, after Emperor

Constantine, the Christian Church had claimed its own political role, concurrent to that of civil authority. The libertine-style vision put forward in *Natural[...]Thoughts*, which seemed to be indifferent to the variety of historical religions, was thus outpaced by a classification of religions based on a principle of functionality and sociopolitical use; Sarpi linked it to a reconstruction of the centuries-old development of Christianity that he was to present in greater detail in his historical works (Tuck 1993, pp. 99–100).

While he was revising these reflections, Sarpi became part of public life, taking advantage of a concrete, sensational dispute between Venice and Rome. The Interdict led him to experiment with a different writing style that was aimed at political communication and to tackle themes that were unlike his previous notes and essays. In the most comprehensive work he wrote in 1606 – *Considerations on the Censures [...] by Pope Paul V against the Venetian Republic*, published in Italian and Latin – he presented the Venetian cause while also defending the Republic's profound loyalty to Catholicism. By issuing laws regarding church property and punishing criminal clerics, the Venetian Republic – he claimed – had exercised a fundamental right and duty that God entrusted to secular authorities: that of protecting its own subjects and the authenticity of religious piety. Paul V accusation of Venice violating "ecclesiastic freedom" was merely an excuse. In fact, Paul V used the expression "ecclesiastic freedom" to refer to the economic and personal privileges the clergy had acquired, attributing a new, unheard-of meaning to the Christian freedom that Saint Paul had claimed and had been practiced in the church during the early centuries. At the same time, in his advice for the senate and in other printed pamphlets, Sarpi urged Venetian clergymen to respect the government's orders about the Interdict, suggesting the patricians to appeal for a general council; he argued in favor of the divine investiture of the princes and contrasted the spirit of Christianity in its beginnings with the wealth and wish for power of the Church in his days, citing the Gospels, the patristic texts, and the ancient councils. He now also openly tried his strength on the terrain of the theological

controversy (Cozzi and Cozzi 1969/1997; Pin 2001; Ulianich 2006).

In the critical two-year period, 1607–1609, his studies on ecclesiastical history intensified. The correspondence with the Gallicans spurred Sarpi on: he was encouraged to reappraise recent political and diplomatic affairs in his *History of the Interdict*; he could approach French legal culture and study church institutes in France that were linked to the royal power and independent of the Roman Pope. In a letter to Gillot dated 8 December 1609, he stated with clarity the idea of the profound separation between civil and ecclesiastic authority; the former invested with the exercise of political sovereignty and power of coercion, while the latter operated in a merely spiritual sphere (Ulianich 1961; Vivanti 2010). The parallel correspondence with the Calvinists gave him greater insight into the internal contrasts within the Protestant churches. Sarpi always supported the most intransigent Calvinism. In addition to its decisive role in European politics, he probably appreciated the convergence between ecclesiastical and civil institutions that Calvinism supported and its declaration of the unbridgeable distance between man and God. In 1618 he thus approved when the synod of Dordrecht sentenced the Remonstrants (Ulianich 1956). Other elements of his ethical-political vision emerged in his letters to the foreign correspondents: the controversy against the Jesuits, indicated as the columns of papacy, the disdain for the spread of exterior devotion and ceremonies, and the hypocrisy that Roman Catholicism imposed on Italians, forcing them to “wear a mask” (Pin 2010). His *Treatise on Benefices* clearly represents his confrontation during these years with both ancient and modern ecclesiastical structures. In this work, probably incomplete, Sarpi showed how poverty and the Church’s original community organization had gradually been abandoned owing to the transformation of the episcopacy and monasticism – enriched by bequests and donations – the affirmation of papal centralism, and the system of tithes and benefices. In an effort at concision, he described the decay the Christian Church had attained over the course of an entire millennium (Gambarin 1958; Cozzi and Cozzi 1969/1997). The

comprehensive ambitions of Sarpi the “theologian” are also palpable in *On the authority of Princes*, a draft of a work that was only partially developed (Cannizzaro 2006). Mentioned with high appreciation by the biographer, but only recently discovered in a seventeenth-century handwritten copy, this work was meant to be a reply to Bellarmine’s *De potestate Summi pontificis in rebus temporalibus*, published in 1610. Combining theses by Bodin, William Barclay, and James I, the divine right of the prince is reaffirmed here, leading to an exaltation of the unlimited “majesty” of an absolutist and almost Hobbes-like sovereign. The text also clearly emphasizes the prince’s obligation to impose laws on the church.

In 1610 Sarpi was, however, abandoning his “theoretical” and “systematic” ambitions of the post-Interdict period; in fact, the most intense phase of his activity as a consultant had already begun. In the previous years, his strong ideological commitment had driven him to recommend that the government undertook radical reforms on benefices provisions and projects focused on the autonomy of the Venetian Church from Rome. These plans had been refused by patricians who were more devoted to Paul V and interested in ecclesiastic positions. It was at this point that Sarpi changed strategy. Once he had set aside his unrealistic projects and the ardent anti-Roman tones, he dedicated himself to adapting the style and approach of his advice to a more concrete and everyday battle to defend the sovereignty of the Republic against the clergy’s jurisdictional claims (Pin 2006b). Instead of linking his proposals to theoretical schemes and general principles, he strived to associate them to traditional legal practice in Venice, indicated as a source of valid examples for the correct division of spheres between the State and Church and the restraint of the invasiveness of the latter (Frajese 1994; Pin 2006b). These examples were gathered following a careful study of the documents preserved in the Venetian archives. The historical-documentary research thus became a central element of Sarpi’s work as a consultant; his advice had the characteristic structure of concise dissertations intertwining historical account, legal

analysis, and careful political appraisal. Sarpi repeatedly laid claim to the particular characteristics of the consultant's work in comparison to that of legal professionals (Cozzi 1969/1997; Povolo 2006). At this moment the office had the structure that remained unchanged until the fall of the Venetian Republic.

The new course of action resulted in Sarpi's final change in direction and the writing of his masterpiece, *The History of the Council of Trent*. Shelving the model of the *Treatise on Benefices*, he concentrated on the key contemporary event in Catholicism, reconstructing its "causes and intrigues" by means of a variety of sources: diplomatic correspondence, private memoirs, council registers, and votes (Vivanti 1974). He described the Council of Trent as the conclusion of a centuries-old process aimed at the separation of the clergy from lay society, and the concentration of the power in Paul V hands, to the detriment of the bishops. It was therefore an unheard-of "deformation" that marked the triumph of papal monarchy and not a response to hopes of the Church reform. Inspired by Guicciardini, Sarpi portrayed with painstaking accuracy and polemic vigor an entirely political affair of the fight for power (Cozzi and Cozzi 1969/1997; Asor Rosa 1993).

Sarpi has always been a highly controversial figure. An excommunicated friar at the service of a Catholic state and author of works that circulated extensively in Protestant countries, he was constantly attacked by the Roman Curia as a heretic, an unbeliever, and a champion of hypocrisy (Infelise 2006; Infelise 2010). The Venetian Republic defended him and countered his profound morality as a public man and his integrity of life backed by several members of the Servite Order (Barzani 2004). The revival of his writings by eighteenth-century jurisdictionalism was marked by a bitter dispute that was repeated in the nineteenth century (Frajese 1994). The multiplication of critical studies after the middle of the twentieth century also gave rise to debate, resulting in divergent interpretations based on Sarpi's manifold and at times contrasting stances formulated in his *Thoughts*, in the letters, in the advice, and his historical works. A variety of images of Sarpi have therefore been put forward that are difficult to reconcile: the Calvinist, the

Pauline-spirited religious reformer, the "moral atheist" who tended to dissimulation, the "agnostic," and the skeptic philosopher. The relationship between some of Sarpi's positions and the rationalistic attitudes connected to anti-Trinitarianism has not yet been studied in depth (Trebbi 2006). The difficulty in suggesting coherent and comprehensive interpretations is confirmed by a recent eccentric portrait of Sarpi the "fideist" and passionate believer, who became a servant of both "God and State," thanks to his profound desire for reform (Kainulainen 2014). The problem of Sarpi's religious beliefs is still open and might always remain so. However, research carried out in recent decades confirms that the consultant of the old Patrician Republic was a key figure in the European political culture itself in the transition between "reason of state" and absolutism and a man able to offer an original insight on the philosophical-scientific and religious stimuli circulating in an epoch of great confessional conflicts.

Sarrocchi, Margherita

Born: Naples, 1560

Died: Rome, 1617

Meredith K. Ray

University of Delaware, Newark, DE, USA

Abstract

Margherita Sarrocchi (1560–1617) was a poet, natural philosopher, and early supporter of Galileo. A celebrated polymath, Sarrocchi was the author of the epic poem *Scanderbeide*, first published in 1606, with a second, posthumous edition in 1623. She also authored works of literary criticism and mathematics that are no longer extant. A member of at least three academies, Sarrocchi hosted intellectual gatherings at her home in Rome. In 1611, Sarrocchi met Galileo when he visited Rome following the publication of his *Sidereus nuncius*; after Galileo returned to Tuscany, Sarrocchi began a correspondence with him which lasted until at least 1612. Sarrocchi died in Rome in 1617.

Biography

The Neapolitan poet and polymath Margherita Sarrocchi (1560–1617) was linked to some of the most well-known figures of her time and praised in letters and verse by her contemporaries. Deeply integrated into the fabric of early modern intellectual society, Sarrocchi was renowned not only for her epic poem, *Scanderbeide* (first edition 1606; second edition 1623) but also for her virtuosity in natural philosophy, including astrology and mathematics (Borzelli 1935; Russell 2006 and Ray 2015). Sarrocchi hosted a well-attended intellectual salon in her home – guests included the poets Torquato Tasso and Giambattista Marino, the mathematician Luca Valerio, and Federico Cesi, founder of the Accademia dei Lincei – and was associated with at least three formal academies, including the Umoristi and the Ordinati in Rome and the Oziosi in Naples. Details about these activities are found in (Capaccio 1608; Erythraeus 1729 and Toppi 1678). Sarrocchi also had links to the Accademia dei Lincei, who may have considered her for membership (Gabrieli 1989). Sarrocchi maintained close ties to the powerful Colonna family, traveling to Naples with the household of Marcantonio II Colonna and dedicating the 1606 edition of the *Scanderbeide* to Costanza Colonna of Monteleone (1556–1626). At the height of her career, Sarrocchi helped promote the telescopic discoveries of Galileo, whom she met in Rome in 1611. According to one of her biographers, so admired was Sarrocchi for her intellectual virtuosity that she was offered a chair in philosophy at the University of Bologna, “con mille e più scudi all’anno di provisione” – an annual salary of one thousand scudi, or more (Bronzini 1625), though no additional documentation of this claim has surfaced.

After the death of her parents, Sarrocchi was brought to Rome by the erudite cardinal Guglielmo Sirleto (1514–1585), who was appointed Vatican librarian in 1570. Sirleto placed Sarrocchi in the convent of Santa Cecilia in Trastevere and oversaw her unusually thorough education: Sarrocchi received instruction in Latin and Italian poetry and in mathematics from Luca Valerio (1553–1618), a friend of Galileo’s who

would become Sarrocchi’s lifelong intellectual companion (Baldini and Napolitani 1991). By 1588, Sarrocchi had married Carlo Birago (possibly an academician), but her relationship with Valerio remained her most enduring bond.

Sarrocchi’s stature as a woman gifted in the study of mathematics, astronomy, and natural philosophy, as well as poetry is attested to by numerous sources (della Chiesa 1620; Bronzini 1625). She is said to have authored commentaries on Della Casa and Petrarch, translated Musaeus’s *Hero and Leader* from the Greek, composed an essay on the theorems of Euclid, and written a theological treatise in Latin. Sarrocchi’s verses were included in an anthology compiled by Muzio Manfredi, titled *Componimenti raccolti da diversi per Dame Romane* [Compositions for Roman Ladies 1575]; and Tasso and others praised her in sonnets and letters (Manfredi 1606; Manuzio 1952 and Tasso 1994). In 1588, she contributed poems to Giulio Iasolino’s *De rimedi naturali* [On Natural Remedies], a balneological work dedicated to a member of the Colonna family.

In 1606, Sarrocchi’s *Scanderbeide* was printed (in a partial edition of only eleven cantos, which Sarrocchi claimed – probably disingenuously – not to have authorized). The work, a Tassian poem that recounts the military struggles of the Albanian hero George Kastrioti, or Scanderbeg, against the Ottomans, contains episodes relating to astrology and other aspects of natural philosophy and was the first complete work in the epic genre to be published by an Italian woman writer.

Sarrocchi was working on a new, complete edition of the *Scanderbeide* when she met Galileo, who had come to Rome to seek support for the discoveries detailed in his *Sidereus Nuncius*. Galileo attended Sarrocchi’s salon, where the two are said to have discussed “the movements of the heavens and other truly productive and celestial things” (Bronzini 1625). After Galileo’s return to Florence, they began a correspondence lasting from July 1611 to June 1612 (Govi 1870; Galileo 1890 and Bayarri 2004). Sarrocchi sought Galileo’s aid in revising her poem to a Tuscan standard and choosing a new dedicatee for it, offering in exchange to promote and defend Galileo and his discoveries to the scientific and literary

community (Ray 2015). Indeed, Sarroccchi expressed support for Galileo in letters to others, writing for example to Guido Bettoli of Perugia that “all that is said about the discovery of the stars by signor Galileo is true: that is, that with Jupiter there are four wandering stars with their own motion, always equally distant from Jupiter, but not from each other; and I saw them with my own eyes through Signor Galileo’s spyglass, and showed them to various friends, which the whole world knows” (27 August 1611). Sarroccchi also discussed astrology in her letters to Galileo, with particular reference to the production of natal charts, an activity in which both she and Galileo were skilled. The extant Sarroccchi–Galileo correspondence is comprised of seven letters from Sarroccchi to Galileo, transcribed in Favaro *Opere di Galileo Galilei*, and one letter from Galileo to Sarroccchi, in the Archivio di Stato di Modena. Sarroccchi is also mentioned in Galileo’s letters to Valerio (all translated in Ray 2016). The correspondence between Sarroccchi and Galileo appears to have ceased after 1612, possibly as a result of increasing tensions between Galileo and the Church.

When Sarroccchi died in 1617, she had achieved considerable recognition and stature. The *Avvisi*, a newsletter of important events in Roman society, praised her as “a woman of wide reading and excellent virtue, having published the heroic poem *Scanderbecheide* [sic] and other works,” and described her funeral in Santa Maria del Minerva, where she was “crowned with laurels and favored by the accompaniment of virtuosi and by many compositions [offered] around her coffin” (Verdile 1990).

Innovative and Original Aspects

Sarroccchi’s epic poem, *Scanderbeide*, was the first work of epic poetry to be published by an Italian woman writer. While it adheres in many respects to the model of Tasso, it presents some innovative aspects, for example, in the depictions of Calidora (1606 edition only) and Silveria, independent female characters invested with knowledge of the natural world (Cox 1997; Cox 2011 and Ray 2016). Sarroccchi’s poems and writings in the area

of literary criticism, translation, and mathematics were well known to her contemporaries, as was the literary salon she convened in her home.

Impact and Legacy

As the author of an epic poem and a member of the scientific circle that promoted Galileo in the early 1600s, Sarroccchi’s impact and legacy are multifaceted and reflect the deeply entangled nature of literary and scientific culture in early modern Italy. Not only is she important for her literary production, which provides a model of female-authored epic poetry that would influence later writers such as Lucrezia Marinella, but her example also offers important evidence of the role of women in the evaluation and dissemination of knowledge in the era of the Scientific Revolution.

Satan

► Devil, Renaissance Idea of

Satire in Renaissance Literature

Paola Ugolini

Department of Romance Languages and Literatures, University at Buffalo, Buffalo, NY, USA

Abstract

Satire, in both prose and verse, was a relevant form of expression in the Renaissance. The development of Renaissance satire was influenced by the new vogue for the classics that brought back to fame satirists such as Horace and Juvenal. During the Renaissance, satiric works were written in neo-Latin and in the vernaculars and both in prose and in verse. Prose satire took the form of dialogues, letters, or mock encomia. Verse satire took the form of the satiric *capitolo* in rhyme, and such poetic forms began to be published in collections of works by different authors. During the same period, satire was also systematized from the theoretical point of view in various treatises on the nature of the genre. In spite of its popularity, nonetheless, satire experienced a drastic downfall at the end of the sixteenth century.

Satire: A Definition

“*Satura tota nostra est*”: satire is entirely ours, famously said Quintilian to highlight the Roman origins of the genre. The term satire comes from the Latin *satura*, i.e., “full” and appears to be related to the gastronomical term *satura lanx*, a stuffed dish of uncertain identification. The idea of satire as being mixed, varied, and difficult to define corresponds to the nature of the genre. An exact definition of satire as a genre is complicated by the many forms that satiric works can assume, varying from verse compositions (such as the popular Renaissance form of the satiric verse *capitolo*) to prose essays which can take the form of letters, dialogues, mock encomia, and many more.

Satire extends from classical antiquity to the present times, making it a multifaceted and almost timeless genre. In addition, it encompasses not only a vast variety of literary forms, in both prose and verse, but also modes of expression: while “satire” is most often understood as pertaining to literature, it actually ranges from literary works to the visual arts and to performances. The tone of satire, too, can be extremely varied, spanning from polite amusement to angry invective. The variety of the genre has resulted in a very broad usage of the term satire: as pointed out by Alvin Kernan, “the word ‘satire’ has come [...] to be the general term for any kind of writing which attacks, directly or indirectly, something which is hated or feared” (Kernan 1973).

A definition of satire must take into account the recurring sets of characteristics that the genre has acquired since classical literature and that have persisted through the ages, with impressively few substantial variations. An apparent paradox of satire is that, while the satirist professes to be addressing pressing contemporary issues, most of the features of satire are formulaic.

In his pivotal work on satire, Alvin Kernan has identified such features as concerning the satiric speaker, the scene, and the plot of satire (Kernan 1959). The major merit of Kernan’s work – which concerns satire in general but that has especially important implications in the analysis of some Renaissance satirists, such as Ludovico Ariosto –

has been to dispel a common tendency to interpret the persona of the satirist as an actual self-portrait of the author. The satirist, instead, must be considered a poetic device employed by the author. All satirists share, in fact, some common characteristics: the satirist always portrays himself as a simple and humble man longing for a lost quieter and more natural way of living, and also as a moral man, disgusted by the corruption and loss of morality that surrounds him, who is compelled to write precisely to denounce the dissolution of the contemporary world. The scene that he sees in front of his eyes is, invariably, a scene of chaos and depravity. The world of the satirist is always in a state of disorder, and it is inhabited by individuals characterized by stupidity, ignorance, and depravity. One of the first acts of every satirist is, as a consequence, to mark the distance that separates him from his contemporaries, pointing out how he does not share their way of life or approve of their conduct. Coinciding with his self-representation as a simple man, the satirist claims to write in a plain, straightforward style; a style, furthermore, that avoids any embellishments because its first and only aim is to speak the truth. The satirist depicts himself as the only voice of truth – more precisely, as the only defender of truth in a world that uses language only to deceive and to falsify reality. In the complex and refined world of Renaissance courts, where words and manners needed to be as polished and as carefully chosen as possible, the satirist’s insistence on the truthfulness and the genuine simplicity of his words often becomes a way to oppose courtly culture.

A further common feature of every satire is the absence of any real plot. Despite the satirist’s denunciation, the scene is completely unchanged at the end of the satiric text: the world is still chaotic and corrupted, and its inhabitants are still perverted. And yet, the satirist will not desist from his purpose of denouncing the evils of society. At the same time, he is not expected to be the one to change things, either. In Ruben Quintero’s definition, the satirist sets his role to be that of a “watch-dog”: someone who alerts the rest of the world of possible dangers but who is not expected to be in charge of warding them off (Quintero 2007).

Satire is also always intended as having the goal of providing a corrective to vices, mistakes, and wrongdoings that the satiric speaker sees around him. For such a reason, the satiric speaker during the early modern period has at times been compared to a doctor, and satire becomes the bitter medicine that he employs to try to cure the afflictions of society. Satirists always have a tone that expresses, or at least lets transpire, intense emotions such as rage, disgust, and discontent, and yet, for satire to be written, the satirist must hold a residual hope that something can be changed, especially in virtue of his intervention. The cure of satire consists in exposing its subject to public denigration, thus motivating them to correct their habits.

The notion of the satirist as a doctor intervening against vices was preceded by the idea that magical powers were associated with satire and with the satirist. Robert C. Elliott, who has explored satire from an anthropological point of view, has shown that in a variety of ancient cultures (ranging from the Arab world to Ireland) satire was considered as invested with magical powers. In ancient Greece, the magic of satire was evoked during fertility rituals, and was believed to be able to banish evil through the power of its curse, so that the earth was spared from infertility. Moreover, in different cultures, works of satire were often believed to have the power to create actual harm to the satirist's enemies. In ancient Irish culture, satirists were deemed able to provoke the death of living beings simply with the power of their verse, while the Arabian tribes used to employ satirists in battle, having them ride with the army and cast invectives on the enemy (Elliott 1966). Even when in later cultures (such as in the Renaissance) satire and the satirist had lost their magical allure, the genre and its author might still be feared. One telling example is that of the renowned Renaissance Italian satirist Pietro Aretino, who was known as the "scourge of princes" and who relied on the popularity and on the causticity of his satirical poems and on the fear of defamation that they produced in potential targets as a way to elicit gifts and pecuniary rewards from the powerful.

The Classical and Medieval Roots of Renaissance Satire

When Quintilian defined satire as entirely Roman, he was relying on a rather restricted notion of the genre that included only the kind of verse satire, as composed by authors such as Horace, Juvenal, Lucilius, and Persius. Satire, however, did exist in Greek literature. Thersites, the ugly, ridiculous member of the Greek army sieging Troy in Homer's *Iliad*, has been proposed as being the first known satirist of Greek literature in virtue of his verbal attack on Agamemnon. This type of satire, based on reprimanding the vices of a particular individual, was popularized in Greek culture by the authors of iambic poetry, a poetic form that specialized precisely in personal attacks. A similar style, characterized by the mockery of human vices and by verbal abuse, was also employed by the authors of Greek comedy. Greek comedy, especially through the works of Aristophanes, also advertised the idea that the comic poet was someone who could teach good to the population and that the comic and satiric genres were ultimately useful to the city (Keane 2007).

It is however true that in ancient Rome satire reached a new dignity and a new systematization: it was thanks to the Romans that satire became an actual literary genre. Roman satire was always intended as a written genre and aimed at a literate public. Roman satire also fixed the characteristics of the satiric persona and of the satiric scene, as well as of satire as a commentary on contemporary society and of the satirist as the analyst of such a reality.

The most important satirists of Roman literature, and the ones who were both destined to have the largest impact on Renaissance satiric production despite their individual differences in style, were Horace and Juvenal. Horace established the model of satire as a sort of intimate conversation among friends. The style of its poems, while actually carefully constructed, appears as colloquial, almost too casual. Horace's eighteen satires depict various human types that the poet could meet in his daily life. The characters often become ways for the satirist to portray human shortcomings

such as avarice, pedantry, or foolishness. Yet, Horace's speaker always maintains an even-tempered, benevolent attitude; his condemnation of vice is always marked by sympathy and never gives way to wrath.

Juvenal, by contrast, employed a very different style and satiric persona. His satires are written under the urge of outrage, provoked by the moral dissolution that the satirist sees in contemporary society. Juvenalian satire takes the form of an invective launched against such a dissolution, which originates in the poet's indignation and in his lack of hope for the world in which he lives. The style of Juvenal's satires matches such a change in tone: no longer the conversational speech of Horatian satire, but an elevated style, that moves away from comedy and takes his satires in the direction of the style of tragedy. In the Renaissance, Horatian and Juvenalian satires will become the points of reference for two different forms of satiric writings: Horace will be the model of Ludovico Ariosto's colloquial, informal, and ironic satires, centered on everyday events in the author's life, while Juvenal will be the inspiration for a more politically committed kind of satire.

By contrast with the florid production of satires in ancient Roman literature, in the Middle Ages there seems to be a downtrend in the genre to the point that some scholars in the past have argued that satire was almost nonexistent in the medieval period. Recent scholarship maintains instead that medieval satire did indeed exist, and yet it is hard to recognize as such due to its differences in form and content from classical satire, leading medieval satirical works to be categorized under labels other than satire, such as romance, fables, and most often sermons. References to the sacred scripture and Christian values – or better, the lack thereof – played an important role in medieval satirical texts. Many medieval satires take the representatives of the Church – friars, priests, bishops, even the papal curia and the Pope himself – as their target, and princely courts and their courtiers (that will represent a major target of satirical writings in the Renaissance) make an appearance as well. An example of this latter kind of satire is provided by Walter Map's *De nugis curialium* (*Courtier's Trifles*), a text that

introduces the image of princely courts as hell on earth, a concept that will have a substantial fortune in the Renaissance.

In medieval satire, both clergymen and laymen are criticized for their attachment to earthly goods. Yet, the majority of satire criticizing materialism and cupidity was directed specifically against members of the church, who were attacked for their living in disregard of Christian principles. Such anticlerical satires were for the most part written in Latin, the language employed and understood by the clergy, and can therefore be considered self-referential: written by clergymen for their fellow clergymen. The Middle Ages also saw the presence of satirical writings in the vernacular, which were composed by jesters and performed during public festivities, although only a very few documents of this production have survived. A particularly florid medieval form of satire was represented by allegorical fables that often featured anthropomorphic animals (as in the case of the French satirical fable *Roman de Renart*, written by different authors during the twelfth and the thirteenth centuries).

Satire in the Renaissance

Despite such appearances of satire in the ages that preceded the Renaissance, scholars agree that the birth of the current concept of satire needs to be traced back precisely to the Renaissance. The notion of the Renaissance origins of the present concept of satire was first introduced by Jakob Burckhardt, who in his groundbreaking study *The Civilization of the Renaissance in Italy* (first published in 1860) devoted a chapter exclusively to the birth of “modern wit and satire” (Burckhardt 1990). Burckhardt identifies the “absence of satire” in a collection of short stories composed in the thirteenth century as the biggest indication of the collection's “antiquity.” Although his statement may now sound too radical, it is undeniable that the Renaissance witnessed a sudden increase in the production and in the dissemination of works of satire. The reasons for such a success of satire are to be found in the retrieval of classical literature and in the

appeal that satire as an erudite commentary on contemporary society could have on the educated urban elites of the period. The popularity of the genre among the urban elites of the Renaissance has been compared to that of modern journalism for the present public. In addition, the flexibility of satire as a genre and the possibility that it offered for experimenting with new modes of expression made it particularly appealing to those who were in search of novel forms of writing (Blanchard 2007).

Fifteenth-Century Neo-Latin Satire in Verse and in Prose

The most popular satirists during the Middle Ages, and until the thirteenth century, had been Juvenal and Persius, whose texts, thanks to their moralistic tone, were considered close to biblical in nature and therefore better suited to the spirit of the time (Marsh 2014). It was during the Humanistic period and the rediscovery of the classics that Horace became a prominent model as well. The dissemination of satire in the fifteenth century was further fostered by the arrival of the printing press. More than fifty editions of Juvenal were printed during the fifteenth century; while the works of Horace – who had already been included among the greatest poets of all times in the fourth canto of Dante's *Divine Comedy* – became the center of attention thanks to Cristoforo Landino's very successful annotated edition printed in 1482 and to the many more annotated editions that followed (Abbamonte 2015).

Particularly relevant among the authors of Latin verse satire in the fifteenth century were Francesco Filelfo and Tito Vespasiano Strozzi. Filelfo is the author of ten *Satyrae* composed between 1431 and 1448 and printed in 1476. Filelfo's satires are noteworthy for demonstrating the influence of Horace while at the same time still being close to Juvenal's style. Filelfo's *Satyrae* features the common themes of the genre and, more originally, specific reflections on contemporary events. The legacy of Juvenal is evident in the invectives against what the author sees as the main vices of his times.

Strozzi's satires (published posthumously in 1514), by contrast, verge significantly in the direction of Horatian satire, as testified to by their epistolary form, structured as letters to friends and family (and therefore different from Juvenalian invectives), and by their mild and jovial tone. In addition, Strozzi's satires differ from Filelfo's for their criticizing not individuals but just their vices in general. Strozzi's satires feature subject matter such as praise of the villa and critique of the city, encomia of virtuous friends, and, intriguingly, also include a first systematization of satiric poetry, which attempts to define what the style and the topics of satire should be.

In addition to verse satire, the Renaissance also saw the production of numerous prose satiric writings. The development of prose satire in Europe was a byproduct of the renewed popularity of the Greek satirist Lucian of Samosata, whose works were translated into Latin and subsequently into the European vernaculars (Smith 1966). Lucian's satirical eulogies are also considered the model for early modern neo-Latin mock encomia, the most famous example of which is represented by Erasmus's *Moriae Encomium* (1509).

One of the most influential neo-Latin works of prose satire was Enea Silvio Piccolomini's 1444 *De curialium miseriis* (*On the miseries of courtiers*). The text, written as a letter to a friend, pertains to the genre of complaints on life at court, and Piccolomini most likely drew inspiration for the work from his years at the court of Emperor Frederick III in Vienna. Piccolomini's critique of courts and courtiers is also indebted to a medieval tradition. Anti-court writings were particularly popular in twelfth-century England, thanks to the works of authors such as John of Salisbury, Peter of Blois, Nigel of Longchamps, and Walter Map. Just like his predecessors, Piccolomini depicts life at court in utterly negative terms, both from the physical and from the moral point of view. Analyzing experiences related to the senses, Piccolomini comes to the conclusion that there is nothing at court that does not offend human perceptions: life at court means ugly sights, unbearable noises, disgusting smells, and unpleasant flavors. In addition, the court also corrupts a man's integrity. The court is so saturated

with the most awful vices – flattery, duplicity, ambition, envy, greed, cut-throat competition among peers – that even the most virtuous among men cannot preserve his integrity. Piccolomini's satirical letter while reiterating some elements that were typical of medieval moralistic satires (such as the idea of the court as a place for corruption that encourages men to desire fame and riches distracting them from the pursuit of eternal salvation) also introduces new elements that will be echoed by later satires: in particular, the notion of the frustration of a worthy courtier who is not rewarded for his loyal service and who sees instead himself disregarded while cunning sycophants receive all the favors.

A more indirect but equally vehement critique of early modern society – and especially of court culture – is expressed in Leon Battista Alberti's *Momus or The Prince* (1446). Through the mouthpiece of Momus, the Greek god of criticism, Alberti voices a denunciation of human vices, paying particular attention to the reality of the papal court (to the point that the work has been interpreted as an allegorical satire of fifteenth-century papacy). Both Piccolomini's and Alberti's works will play a crucial role in establishing the critique of courts and courtiers as one of the main subjects of Renaissance satiric writings.

The Development of Satire in the Sixteenth Century

After its neo-Latin examples, satire flourished all over Europe. The complex, variegated – some would even say “easy” – nature of satire was, according to some critics, one of the reasons behind its success. The permissiveness of the organizational principles of satire and its “mixed dish” nature that gave the genre its name allowed writers to enjoy a notable amount of freedom in writing. It was over the course of the sixteenth century, and in the prefaces to vernacular collections of satires, furthermore, that Renaissance satire received an extensive systematization.

The rediscovery and the successive dissemination and systematization of satire were particularly relevant in Renaissance Italy. The reason

for the peculiar Italian interest in satiric writings is to be found in the connection between the public dimension that characterized everyday life in the city-states that populated the Italian peninsula during the Renaissance and the public nature of satiric writings. In addition, the presence of satirists such as Horace, Juvenal, and Lucian among classical authors further ensured that, in a culture that highly valued imitation of the classics, satire could have its space as a genre. And finally, the prestige in which both the classics and Italian literature and culture were held all over Europe during the Renaissance created the basis for the development of satiric writings inspired by both the classical and the Italian models throughout the entire continent (Blanchard 2007).

Prose satire in the Renaissance appeared in different forms that could be inspired by the classics or represent an original Renaissance creation. Among the styles directly inspired by classical models were the mock encomia, where the speaker praised subjects commonly considered unworthy of praise (such as baldness, ignorance, indigence), thus intertwining satire with the rhetorical genre of the paradox. The purpose of this kind of satiric writings was often an indirect critique of the customs of the time.

Classicist Verse Satire in Italy

Renaissance verse satire was based on models developed in the Italian peninsula as well. One of the main forms of satirical expression in sixteenth-century Italian literature was the satiric *capitolo*, a verse composition that adopted the rhyming style of the *terza rima*. The *terza rima*, inaugurated by Dante's *Divine Comedy*, consists of a series of hendecasyllables set according to the rhyme structure ABA, BCB, et cetera. This particular structure makes the *terza rima* particularly apt for a discursive style, a characteristic that explains its success as mode of expression for verse satires.

The establishment of the *capitolo* as the preferred form for verse satire is dependent on the composition and publication of Ludovico Ariosto's seven satires, composed in all

probability between 1517 and 1525, and most likely at first privately circulated among the author's friends until their posthumous publication in 1534. The *Satires*, which experienced a long-lasting success after their publication, can be considered the foundation of Renaissance verse satire in the vernacular also in terms of style, of the topics of satire, and of the self-portrait offered by the satiric speaker.

Ariosto was the main source for the shift from the Juvenalian embittered tone that prevailed in medieval satires to the mild Horatian tone that became the preferred satiric style in the Renaissance. Similarly Horatian is the use of apologues: short stories involving speaking animals, or fantasy settings, that become the starting point for moral reflections on the state of the world and on human nature. Ariosto follows the epistolary model of Horace, by having each one of the satires addressed to a relative or a friend of the author's, which gives the poems the tone of private, informal conversations among intimates. The style is constructed accordingly: despite being the carefully crafted work of an extremely skilled and erudite poet, the *Satires* may at first reading appear as a casual and unsophisticated work written under the impulse of the moment. In accordance with such a style, Ariosto's satiric speaker adopts an easygoing and unpretentious persona. The author portrays himself as a genuine man, alien from the duplicity and from the complications of his contemporary world, honest to the point of bluntness, and aspiring to a life of quiet and rustic simplicity. The court society features preeminently in the collection: the first and the third satire depict in rather grim terms the author's relationships with his patrons, members of the eminent Renaissance dynasty of the Estes, rulers of Ferrara. The entire collection features the lamentation of the early modern court *litteratus* who sees his intellectual accomplishments disregarded in a court that forces its poets to turn into bureaucrats and that favors flattery over talent and dedication. The satires that are not directly or indirectly related to the world of the courts and to social and political events take their cue from events in the life of the author or his addressee (such as how to provide the best education for a

son, or whether to marry or not) to cast a reflection on contemporary society.

Ariosto's *Satires* became an extremely influential piece of work. In Italy, numerous writers followed in Ariosto's footsteps, most of whom also replicated his satiric persona and his mild and witty style. The most noteworthy exception in this sense is represented by the Florentine Luigi Alamanni, author of thirteen satires, twelve of which were published in France between 1532 and 1533 and which stand out for their heavily political tone and for their solemn and bitterly polemic style.

Ariosto's satires were soon disseminated outside of Italy as well. In France, they were an inspiration for the poet Joachim Du Bellay, and two of them were adapted into French by Jean Vaquelin de la Fresnaye between 1574 and 1595 (Wiggins 1976). The first English translation appeared in 1608, and one additional translation (titled *Ariosto's seven planets governing Italie*) followed in 1611.

The vogue for satire was further supported by translations of classical satires and by treatises that strived to define the genre and to confer to it literary prestige. In 1559, Ludovico Domenichi published a translation of Horace's works that was accompanied by a treatise on the origins of satire and by a discourse on satire. Essays providing theoretical systematizations of satire were also contained in collections of satires by different authors. In 1560, Francesco Sansovino published a collection titled *Sette libri di satire* (*Seven Books of Satires*), which featured works by well-known Italian satirists including Ariosto and which was introduced by Sansovino's own *Discorso sopra la materia della satira* (*Discourse on the Topic of Satire*). In his discourse, Sansovino highlights the educational and corrective purpose of satire, a moral genre created precisely to criticize bad habits and to discourage immoral behavior. Such a corrective character of satire is presented as dependent on the very nature of the genre. A popular Renaissance etymology erroneously connected the word "satire" to the word "satyr," the name of the Greek woodland deities known for their completely natural and untamed behavior. Just like the satyrs, the satirists are rustic and

even insolent at times and speak in plain and unaffected words. What readers need to infer is that the satirists' insolence must be tolerated since it is intended for the good of society, aimed as it is to chastise vice. Satire's simple style is related to the satirist's honest nature and to his always speaking the truth.

Similar concepts are expressed in Ludovico Paterno's *Lettera sopra la materia della satira* (*Letter on the topic of satire*) published in Mario degli Andini's *Satire di cinque poeti illustri* (*Satires of five illustrious poets*), published in 1565. Paterno reiterates the link between satirists and satyrs and once more presents a picture of satirists as the ones in charge of pointing out and castigating misconduct and whose harshness should therefore be excused. Paterno maintains in fact that satirists are like good doctors, who do not hesitate to cut off a damaged limb in order to save the rest of the body.

Non-classicist Satire: The Invention of Pasquino

A peculiar – popular and not dependent on classical models – form of satire was also born in sixteenth-century Rome. At the beginning of the sixteenth century, the mutilated torso of a Roman statue was unearthed in a Roman *piazza*. By a means still unknown, people took the habit of attaching to the statue anonymous satirical poems that criticized the authorities of the city. The poems, known as pasquinades, represented the voice of popular discontent against those in power.

Many people made use of the mask of Pasquino to compose and disseminate satiric texts, and yet one writer in particular became so skilled in the genre of pasquinades that he was eventually able to build for himself a long-lasting reputation as a respected, even feared satirist. That writer was the notorious Pietro Aretino, whose works became the model for sixteenth-century vernacular prose satires. Aretino, furthermore, invested in fashioning himself as a satirist to the point that he chose the figure of the satyr, with his completely natural nature and his blunt sincerity, as his own *impresa* (Waddington 2004).

Prose Satire: The Works and Influence of Pietro Aretino

The appeal of Aretino's works of satire resides in their addressing the most relevant aspects of Renaissance culture. His pasquinades provided a cynical portrait of Roman society under the controversial papacies of the two Medici popes, Leo X and Clemens VII. His most renowned pieces of work are two satirical dialogues that, although different in topic, present a homogeneous critique of contemporary society. The *Sei giornate* (*Six Days*), published in 1534, features a series of dialogues among prostitutes, presenting a disenchanting view of Renaissance society as based on meretricious exchanges. The *Ragionamento delle corti* (*Dialogue on the Court*), published 4 years later, by proclaiming the court as the antithesis of culture demolishes the patronage relationship between prince and writer on which the status of the early modern *literatus* was founded.

Aretino's works are also relevant in establishing a new role for the early modern satirist. Aretino was able to refute the court and to support himself with his writings, thanks to the newly developed printing press, and most of all to his ability to establish himself as the arbiter of the reputation of the powerful, that he could either praise or blame in his satires. Aretino's clever blackmailing of those in power allowed him to become one of the first authors that could live, in the modern sense, off of the profits of their written work. Aretino's satires heavily influenced the generation of satirists that came after him. Later authors tried to follow in his footsteps in highlighting the most disquieting aspects of the crisis of the sixteenth century but also trying to replicate his model of an independent author.

Prose and Verse Satire in Europe

The influence of Pietro Aretino's works on English Renaissance satire is evident in the works of Thomas Nashe, who like Aretino wrote licentious works and satires that deal with the difficult conditions of early modern *literati*. English literature produced a systematization of

verse satire, too. The form and purpose of satire were investigated in George Puttenham's *The Arte of English Poesie* (1589), where, similarly to what happened in Italian texts, the satirist is defined as a moral individual who is in charge of reforming his fellow men from vice. Both Horace and Juvenal were models for English satirists, with John Skelton's satires being usually considered closer to Juvenalian bitterness, while Thomas Wyatt's are usually deemed closer to Horace (Jensen 2007). Wyatt's most famous satire, "Mine Own John Poyntz," is centered on the popular sixteenth-century topic of the immorality of life at court. The anti-court theme was prevalent also in John Donne's satires, which circulated in manuscript form in the last decade of the sixteenth century. Another celebrated work of English literature, Thomas More's *Utopia* (1516), can also figure among satirical works given the criticism of present-day society it provides through the protagonist Raphael Hythlodæus's journey to the eponymous fictional island and through the depiction of its society and mores.

In France, the influence of Italian humanists led intellectuals to cast an increasingly critical view of surviving medieval institutions and the forms of learning that they promoted. The production of satiric writings in France was also fostered by the religious wars (from the 1560s until the end of the century) and by the social crisis that followed (Smith 1966). The peculiarity of French satire in the Renaissance is that the new forms of satire inspired by the humanists and their rediscovery of classical literature flourished while medieval forms of satire continued to survive. The two coexisting traditions were skillfully combined in the works of Francois Rabelais (Duval 2007). Rabelais's masterpiece *Gargantua and Pantagruel* (consisting of five books published from 1532 till 1564) features a wide variety of satiric targets, such as scholasticism and medieval forms of learning and teaching, political institutions, and the corruption of the monastic orders. In addition to Rabelais's work, the French Renaissance also experienced the revival of classical satire that emerged in the rest of Europe as testified to by the works of Joachim Du Bellay.

In Spain, satiric dialogues were developed in the sixteenth century under the combined

influence of Erasmus and of Lucian. Such satiric elements would, in the following century, feature prominently in the works of Miguel de Cervantes, whose masterpiece *Don Quixote de la Mancha* shows the legacy of Renaissance satiric writings (Gatti 2007).

The Decline of Satire

It was precisely at the moment when satire was experiencing its maximum success and dissemination that changes in European society and culture provoked its sudden decline. The popularity of satire received a halt in the second half of the sixteenth century when the index of prohibited books started banning satiric pieces of writing. As a result of this ban, the production and the publication of satiric texts decreased rapidly (Romei 1998). The downtrend was particularly evident in Italy, where the works of the most popular satiric (and, at large, comic) authors were banned in different editions of the Index published between 1564 and 1593. From that moment on, collections of satires circulated only in manuscript form, and satire was for a long time forced to a clandestine existence. In Spain, works that could be classified as satirical or comical, and that had been popular until a few years earlier, now had to be published in expunged editions to avoid censorship, and also in England the religious authorities issued a similar ban against works of satire at the end of the sixteenth century. Even in countries where the impact of Counter-Reformation ideas and of the censorship fostered by the Index was less significant, less noteworthy works of satires were produced, making the decline of satire a general phenomenon.

Abstract

Girolamo Savonarola was one of the most important Italian preachers of the Late Middle Ages. He was a Dominican friar who lived in

fifteenth-century Italy, between Ferrara and Firenze, where he died following his death sentence on 23 May 1498. His fame is due to his intense preaching activity which reached its acme between 1494 and 1498. His message had theological, moral, and political contents and spoke to every social class; indeed, he addressed people in the vernacular Italian language and often, for his theological and philosophical treatises, opted to employ the vernacular rather than Latin (e.g., *Trattato contro gli astrologi*, *Trattato circa el reggimento e governo della città di Firenze*). He also wrote Latin works that he translated into Italian himself (e.g., *De simplicitate christianae vitae*, *Triumphus crucis*, *Compendium revelationum*) (Savonarola 1959; Savonarola 1961; Savonarola 1974) and genuine Latin treatises and sermons (e.g., *Triumphus fidei abbreviatus*, *Sermoni sul salmo "Quam bonus," Sermoni sul principio della Cantica*) (Savonarola 1976; Savonarola 1999).

Savonarola launched a strong, violent attack against the corruption of the Roman Church and papacy, especially Pope Alexander VI Borgia; he endlessly invited his followers to repent and atone and to recover the fundamental importance of the Holy Writ in Christians' life; he also promoted institutional and social reforms, becoming a prominent figure in the Florentine political life of the late Quattrocento. In 1494, he was sent by the Signoria to negotiate with Charles VIII of France and obtained the king's promise that the French troops would be allowed to pass through the city without violence.

Savonarola claimed to be a prophet, as he explicitly stressed in his *Compendium revelationum*, a work in which he explains the content of his past visions related to the corruption of clerics (the so-called *tiepidi*), to the flood of sins and vices, and to the descent of Charles VIII of France, "the new Cyrus." He pursued his aims until he was captured, tried, and (following a confession extorted through torture) condemned to death: this all happened in Florence, the same city that a few years before had looked to him as a leader.

Biography

1452–1482

Girolamo Maria Francesco Matteo Savonarola (Ferrara, 21 September 1452–Florence, 23 May 1498) was born in Ferrara, the third of seven sons of Niccolò Savonarola and Elena Bonacossi: the family moved from Padua to Ferrara in 1440, when Michele Savonarola (Padua, 1384–Ferrara, 1468), Niccolò's father, was appointed court physician to the Este, at the time of Niccolò III d'Este. Michele, Girolamo's grandfather, played a very special role in his grandson's life: he had taught medicine in Padua and written several medical treatises, such as the *Practica medicinae*, the *Speculum phisionomiae*, and the vernacular work *De regimine pregnantibus*, which is considered one of the first modern texts on pregnancy and childhood (Crisciani and Zuccolin 2011; Pesenti 1977). Michele gave Girolamo his first instrument for studying logic and grammar and introduced him to the school of liberal arts of Battista Guarino, son of the famous humanist, Guarino Veronese (Verona, 1374–Ferrara, 1460). Michele also represented for Girolamo a moral guide and, together with humanistic culture, taught him moral and religious principles: he died in 1468, when Girolamo was sixteen. Following his father's wishes, Girolamo obtained the title of *magister in artibus* at the University of Ferrara, as a first step toward becoming a physician, like his grandfather; he started to attend the Este's court but was disgusted by the luxury and vice he witnessed there. During these years, he began to change his attitude toward life: all of his biographers and Savonarola himself, on several later occasions, state that a new conscience took root inside his soul, and he grew daily more sensitive to corruption, sin, vice, and the low moral stature of the clergy, the *tiepidi* (lukewarm), as he later called religious men. From this juvenile period, we have two poems that testify to the change that was taking place within Savonarola: the *De ruina mundi* (1472) and the *De ruina Ecclesiae* (1475) are his earliest works, containing, *in nuce*, all his major themes (Savonarola 1968, 3, p. 6). At the beginning of May 1475, he visited Faenza (a small town in

central Italy, close to Ferrara) where he heard a friar preaching; he was strongly impressed by a sentence from the book of *Genesis: Egredere de terra tua!* (Leave your Land!): this was the seed of his new life as a friar, as he relates in one of the sermons in the book of Ezekiel (Savonarola 1955b, I, p. 374). Less than a year later, in April 1476, he decided to go to Bologna, to assume the Dominican habit in the convent of San Domenico: he left home without a word but, the day after his departure, wrote to his father, outlining his reasons; his decision created a fracture within the family, but he never looked back. During his first years in Bologna, he was particularly obedient and humble, gladly practicing fasting and prayer, but soon his superiors invited him to prepare for pastoral care and preaching, so he devoted himself to his theological studies. In 1479, for the first time since he left, he returned to Ferrara, as a teacher of novices; it is probable that he had the opportunity to witness a dispute of Giovanni Pico della Mirandola (Mirandola, 1463–Florence, 1494). A few years later, on 28 February 1482, Savonarola met Pico again, during the chapter of the Lombard Congregation of the Dominican Order in Reggio: here, Savonarola carried on a dispute in Pico's presence. During this chapter, Savonarola was assigned to the convent of San Marco in Florence as a *lector*, and this constituted his first Florentine sojourn (Ridolfi 1997; Burlamacchi 1937).

1482–1487

This period was important for several reasons: during the Advent and Lent preaching in San Gimignano and Florence, Savonarola began to elaborate a three-stage prophecy concerning the destiny of the Italians, i.e., the *flagellum* (plague), repentance and atonement, and a final rebirth as a new blessed community. He also experienced the rhetorical taste of the Florentines, a precious background that enabled him to refine and improve his preaching style. Moreover, Savonarola came into contact with the Medici's environment and constructed his own image of this political and cultural community, an image that was to be developed in the following years, mostly during his second Florentine sojourn (1490–1498) (Cattin 1973).

Savonarola's first Florentine sojourn began with a cycle of sermons attended in the church of Benedictine nuns in Florence, the so-called Murate (walled in) for the seclusion: the friar preached at the Murate for Advent, 1482, and Lent, 1483. For Lent, 1484, he was assigned to the cathedral (*basilica*) of San Lorenzo, one of the most important churches in Florence, which was closely connected to the Medici family: the attendants did not like the way Savonarola spoke. His accent revealed his northern origin, and he was considered rough and inelegant by the Florentines, who were used to a more gentle, literary rhetorical discourse, even in a religious context. Placido Cinozzi, a faithful Savonarolian follower, recorded this event in his *Epistola De vita et moribus reverendi patris fratris Hieronimi Savonarolae* (Cinozzi 1898). In the same year, Pope Sixtus IV died and Innocent VIII was elected: the election was dominated by the obscure action of Rodrigo Borgia, the future Pope Alexander VI; on this occasion, Savonarola wrote the *Oratio pro Ecclesia* and a hymn, *O anima cecata* (blinded soul), both in the vernacular, inspired by the moral crisis into which the church was sinking (Savonarola 1968, 4, p. 13). The preaching of the following years, 1485 and 1486, in San Gimignano (small towns between Siena and Florence), was crucial for Savonarola because he introduced into his discourse prophetic themes, particularly during Lent, 1486 (Verde 1989). In 1487, Savonarola preached in the church of Santa Verdiana in Florence before returning to Bologna and Ferrara (1488–1490). He preached in several cities in central-northern Italy at that time (Modena, Piacenza, Brescia, Pavia, and Genoa), but his destiny was, once again, decided by the chapter of the Dominican Order, held in Como in 1490. He was appointed *lector* to the convent of San Marco in Florence, but this assignment was not random; we have a letter from Lorenzo de' Medici, dated 29 April 1489, in which the Magnifico asked for *frate Hieronymo da Ferrara* to Florence. The request came from Giovanni Pico della Mirandola, who still remembered the friar he met in 1482, during the Reggio chapter; Pico had been in Florence, at Lorenzo's court, since 1488; Lorenzo himself may

have had several reasons for recalling Savonarola to Florence related to his personal spiritual condition and the role of the convent of San Marco (Weinstein 2011).

1490–1494

Savonarola arrived in May 1490 and took up his role as *lector* at the convent of San Marco. During Girolamo's absence, Lorenzo de' Medici had increased his power, and, by that time, the members of the Medici circle controlled all of the most relevant commissions and institutions in Florence: the *accoppiatori*, for instance, who selected the members of the government, which was now closer to a *Signoria* than a republic (Rubinstein 1977). The first cycle of sermons was about the *Apocalypse* (Verde 1988), from August to the beginning of January, and, in the mornings of public holidays, he preached on the first letter of St. John (Savonarola 1998): his aim was to "say new things in a new way" (*nova dicere et novo modo*), indicating that he meant to address the public in a new, simple manner, avoiding the complex structure of the scholastic sermon and focusing on the Holy Writ. The tone of the sermons was harsh and firm, and the content was a critique of society based on the eight reasons he had already identified in 1486. Savonarola was invited to preach in the Cathedral of Santa Maria del Fiore, where he attended for Lent, 1491, urging his audience to repent and recalling the forthcoming troubles (*tribulazioni*) in the light of human sin (Savonarola 2001); he identified himself with the Old Testament prophets like Elijah, Amos, and Isaiah.

On 16 May 1491, Savonarola was elected prior to the convent of San Marco; a consequence, which was surely appreciated by Lorenzo de' Medici, was the increasing number of novices, especially among the eminent Florentine families, since the convent was losing the important role it had played at the time of Cosimo de' Medici; Niccolò Seratico (a future secretary of Savonarola) entered the convent in 1494, Zanobi Acciaiuoli in 1496, Giorgio Antonio Vespucci in 1497, and Giovanni Pico della Mirandola in 1494, just before his death.

On 2 April 1492, Lorenzo de' Medici died in Florence, and his son, Piero, replaced him as leader of the Florentine government; unfortunately, he did not possess his father's capacity. The death of Lorenzo precipitated the alliance between Ludovico Sforza and the French king, Charles VIII, considering that the Magnifico had always urged the necessity for an inner Italian league, without external influences, as ratified by the peace treaty of Lodi (1454). Ludovico supported the Italian descent of Charles VIII, who announced his advent in 1491 claiming the reign of Naples. In August 1492, Rodrigo Borgia was elected Pope Alexander VI (1492–1503).

In 1492 and 1493, Savonarola described his visions and prophecies about the destiny of the Italian nation: we have mostly indirect statements for these years, since we do not have the *reportationes* of his sermons but merely his memoirs gathered in the *Compendium revelationum* and several sermons from 1494 to 1495, especially the *predica della renovatione*, held on 13 January 1495 (Tromboni 2013). The Lent preaching of 1492 started with the idea of a separation from the Lombard Congregation of the Dominican Order and the foundation of a new Tuscan autonomous congregation, accomplished in 1493 (Verde 1994b).

1494–1498

In the meantime, Charles VIII, after the death of Ferrante, king of Naples (on 25 January 1494), was preparing his Italian enterprise, when Savonarola began to report to the Florentines that the *flagellum* was coming: during Lent, 1494, in *Sermones quadragesimales super archam Noe* (ed. Venetiis 1536), he advised his followers to build a new arch in order to ensure their safety. The whole of Italy was frightened by the reports of the disasters caused by the French army, and Piero de' Medici, unlike Ludovico Sforza, refused to support Charles VIII. In June 1494, the French king expelled from France all Italian bankers and merchants, thereby striking a harsh blow to the Florentine economy; Piero, stuck between an anti-French league, led by the pope and the king of Naples and the approaching king of France, thought that perhaps he could face the French

army with his own resources. In September, Savonarola decided to face the situation, recalling the theme of the new arch: at this point, it was natural for all to regard the coming of Charles VIII as the biblical universal flood. Savonarola introduced another metaphor also: Charles VIII was a new Cyrus, who came to purify the whole of Italy and the Church and restore the political balance. From 1 November, Savonarola preached on the book of Haggai, one of his most important cycles of sermons, with which he accompanied his people through the flood, i.e., the descent of Charles VIII (Garfagnini 1997). The diplomatic initiative of Piero de' Medici was disastrous, since he ceded the cities of Pisa and Livorno, the strategic ports for Florence, and a remarkable amount of money. The Signoria decided to organize another expedition, guided by Savonarola, who benefited from the trust of the Florentines; the group left Florence on 5 November 1494. During his conversations with Charles, Savonarola was able to obtain a promise that the French troops would be allowed to pass through Florence without violence which, in the sermons of early 1495, Savonarola would call "a miracle." In the meantime, Piero de' Medici was banished from the city as the popularity of the friar increased. Charles VIII arrived in the city on 17 November (the day on which Giovanni Pico della Mirandola died) and departed on the 28th. Firenze was eventually free of the tyranny of the Medici and that freedom was obtained without bloodshed. Many chroniclers, including Pietro Parenti and Luca Landucci, claimed that this was entirely thanks to Savonarola. The friar continued preaching and his authority increased: he finally had a chance to promote institutional and political reform, to enlarge popular participation in government and reduce taxes. The supporters of the friar were called *Piagnoni* and his opponents *Arrabbiati*.

The main concerns of Savonarola at that time reflected the situation in the city: there was a strong contrast between the partisan and the opponents of the Medici, and the new Florence needed peace and stability in order to develop into a mature society. To extend popular participation in the field of Florentine politics, Savonarola promoted many reforms and also the establishment of

the Maggior Consiglio (Great Council), according to the Venetian model, as the major political organ of the Florentine Republic. The Maggior Consiglio was officially recognized on 23 December 1494, and Savonarola also supported the building of a new political space for the new Council, the Salone dei 500, in Florence's Palazzo Vecchio. In January 1495, he started to preach on the Psalms: the sermon on 13 January was the so-called *predica della renovatione* (sermon of the renovation) against the preacher Domenico da Ponzio who questioned the truth of his visions and predictions. Between 1 March and 24 April 1495, Savonarola preached on the book of Job (Savonarola 1957), stressing the themes of struggle and penitence and the destiny of Florence as a New Jerusalem. He kept pushing for the two reforms: an amnesty for the former supporters of the Medici and the Six Beans' authority.

In the meantime, Pope Alexander VI constituted the *Lega Santa* (Holy League) with Venice and Milan, to expel Charles VIII from Italy, and the figure of Savonarola was increasingly criticized, considering his role in the alliance between France and Florence. On 21 July 1495, the offended Alexander VI summoned Savonarola to Rome to question him about his visions. The friar refused to go to Rome and indicated that the *Compendium revelationum* was the most complete summary of his prophecies. The pope suspended his preaching, but at that time the friar had the Signoria on his side and he decided to return to the pulpit on 11 October 1495. A few days later, on 16 October, another Papal Brief arrived and Savonarola suspended his preaching activity until 17 February 1496, when he started to preach on the books of Amos and Zacharias (Savonarola 1971). He composed the *De simplicitate christianae vitae* (Savonarola 1959) in Latin and the vernacular and other spiritual writings. During summer 1496, Savonarola was invited to become a cardinal of the Roman curia: the pope was seeking to put a stop to his strong preaching activity, which was clearly directed against the clergy and papacy. Girolamo categorically refused the offer, claiming that the only red hat he wanted was a blooded martyrial one (*uno cappello rosso, uno cappello di sangue, questo*

desidero). On 7 November 1496, the pope intimated the dissolution of the Savonarolian congregation, threatening excommunication to all opponents; in Florence, Savonarola was still continuing his reformation process, and, in February 1497, the first bonfire of the vanities (*bruciamento delle vanità*) took place, in Signoria Square, involving a giant stake surrounded by singing children. This was another significant representation of the purity by which Florence should be inspired, but in the meantime, the Italian political situation was changing, and the hurried return of King Charles VIII to France compromised the Florentines' hopes of seeing Pisa return under Florentine domination. On 25 February 1497, Charles VIII signed a truce with the Holy League and took a step back from Italian politics, leaving sufficient space for the other forces to claim their role. Savonarola did not agree to dismantle his congregation and join a Tuscan-Roman one, considering all of the energy he spent on this institutional reform; due to his disobedience, he was excommunicated by Alexander VI on 12 May 1497. In the same year, he composed *Dialogus de veritate prophetica* (Savonarola 1997), to stress the truth of his prophecy, since his opponents were becoming increasingly aggressive and accused him of being a false prophet. 1498 was the last year of Savonarola's life: he composed *Trattato circa el reggimento e governo della città di Firenze* and continued preaching at Santa Maria del Fiore cathedral. On 26 February 1498, the pope sent two Briefs, to the Signoria and to the Chapter of the cathedral, to stop him from preaching, and, on the same day, many supporters of the friar, the *Piagnoni*, met in the church, fighting with the *Arrabbiati*. On 28 February, a new Signoria, hostile to Savonarola, was elected, but he continued to talk to his people, still accusing the pope of moral sickness: Savonarola was banned from the pulpit of the cathedral, and he returned to the convent of San Marco. The Signoria was still defending him but they asked him to fall silent; on 17 March 1498, the pope ordered the arrest of all Florentine merchants and bankers in Rome. It was the last blow in the 3-year fight between the pope and the friar: Florence could not bear the economical repercussions of

the papal decision and the Signoria decided to intervene. On 18 March 1498, Savonarola spoke for the last time to the Florentine people on *Exodus* (Savonarola 1955a; Cervelli 1998), and, a few days later, on the 25th, friar Domenico da Pescia was challenged to a fire test by the Franciscan, Francesco di Puglia. The test failed because of heavy rain (it was 7 April 1498) amid disorder and protests. The following day, Savonarola, Domenico da Pescia, and Silvestro Maruffi were captured in San Marco and brought to the Signoria's palace. From the beginning of April to the end of May, the friar was questioned and tortured repeatedly (Viti et al. 2001), and, at the end of the trial, the three friars were condemned as heretics and separatists. On 23 May 1498, the friars were hung in Signoria Square. Their bodies were then burned and their remains carefully scattered on the river Arno. Luca Landucci provided a detailed description of the execution: Savonarola was hung third, without uttering a word, a circumstance that disappointed his followers; as the chronicler says, many among them lost their faith (*onde non fu senza loro amaritudine. . . molti caddono dalla lor fede*).

Prophecy and Preaching

Starting from the sermons' cycle attended in San Gimignano (Lent, 1486), Savonarola elaborates a well-structured prophecy concerning the destiny of human beings. Year after year, sermon after sermon, the prophecy changes, according to the historical events and the preacher's priorities. This is why, at the beginning of his career, Savonarola formulated a wide, general warning about sin and vice, and, at the end, when the general picture was clear, he gave a precise formula for the prophecy concerning the destiny of Florence, meant to be the New Jerusalem. In 1486, in San Gimignano, Savonarola explicitly listed the eight reasons for the forthcoming plague: the sins and vices of human beings, including sodomy, simony, and lust, the moral sickness of priests, the lower quantity of good men, the lack of faith in human hearts, the spiritual disintegration of the Roman Church, and the excessive importance given to exterior

ceremonies in divine worship rather than internal disposition (Ridolfi 1935, 1997, p. 21). He was in Tuscany for the first time and was appointed as *lector* at the convent of San Marco. His priority at that time was to speak about sin and vice and to urge Christians along the right path. On returning to Florence in 1490, he had changed and so has his manner of preaching; he is now aware of his mission and determined to accomplish it. Therefore, when he starts to speak about the *Apocalypse* in 1490, he stresses the theme of the forthcoming *flagellum*. After Lorenzo's death (1492), the picture changes even more rapidly, since he wished to maintain the Florentine and Italy's political balance. Moreover, in 1492, Rodrigo Borgia became Pope Alexander VI and continued his action against Charles VIII and his dynastic claims to the rule of Naples. Savonarola defines his prophecy according to the Florentine situation; he starts to speak about his visions publicly and gains popularity due to the separation of the convent of San Marco from the Lombards. 1494 is the turning point in his life as a preacher and prophet: the Italian campaign of Charles VIII gives Savonarola an opportunity to see the historical realization of his predictions and the concrete beginning of the renewal process of Florence as the New Jerusalem; the king of France represents for Florence what Cyrus represented for Israel, the key element to be born again as the Elect Nation through the *flagellum*. At this very moment, Savonarola introduces new elements into his sermons, changing the mood of his discourse from a "negative" to a "positive" phase: Charles VIII arrives in Florence on 17 November 1494, and, from December onward, Savonarola included promises of material assets, such as wealth, prosperity, and the reconquering of the cities of Pisa and Livorno that had been lost during the French campaign (Weinstein 1970). Now, the prophecy becomes the reality and is actualized: the prophet and his people are actually living the prophet's announcement. This is why, for Savonarola, it is fundamental to affirm repeatedly the truth of his prophecy, a theme strictly related to his social, pastoral, and political activity in Florence. Apart from being treated in several sermons, the prophetic issue is the main object of two treatises: *Compendium*

revelationum (1495) and *Dialogus de veritate prophetica*. The first was also translated into the vernacular by the author, a circumstance that leads us to consider the importance of the Italian vernacular language as a communication tool in Savonarolian activity, chosen to reach a wide number of followers. In *Compendium revelationum*, Savonarola's visions are described accurately, visions he also recalls in his sermons. During the sermon of 13 January 1495, Savonarola related to the Florentines explicitly the vision he had had back in 1484, when Pope Innocent VIII died: a black cross standing above Rome-Babylon, symbol of sin and vice, with *Ira Dei* written on it and raining swords and a golden cross standing above Jerusalem with *Misericordia Dei* written on it. On top of Italy was a trembling sword, while the angels gave to humans a red cross to kiss and white dresses. Those who accepted the gifts could drink sweet wine, while those who refused them drank the lees. The trembling sword is the sword of Charles VIII, and the angels are the preachers who announce his coming. This sermon met with huge success; it was printed separately and spread, becoming a manifesto of the Savonarolian prophecy. Girolamo's claim to have the gift of prophecy is the critical basis of his actions: he clashes with the pope; he fights with several contemporary preachers, such as Mariano da Genazzano, Domenico da Ponzo, and Giovanni Caroli; and he is strongly criticized by the Florentine *Arrabbiati*. On the prophecy, he built an institutional and social reform system, promoted from 1494 onward, for his adoptive homeland by means of his preaching activity, and the regularity of his sermons clearly reflects the depth of his commitment:

- Sermons, 1494–1498
- Sermons on Haggai: 1 November 1494–28 December 1494
- Sermons on Psalms: 6 January 1495–25 October 1495
- Sermons on Job: 1 March 1495–24 April 1495
- Sermons on Amos and Zechariah: 17 February 1496–10 April 1496
- Sermons on Ruth and Micah: 8 May 1496–27 November 1496 (Savonarola 1962)
- Sermons on Ezekiel: 27 November 1496–27 March 1497
- Sermons on Exodus: 11 February 1498–18 March 1498 (and 4 May 1498)

Political Commitment

The political commitment of Girolamo Savonarola was intended to be a continuation of his moralizing action and was strictly linked to his prophetic vein: we may say that these two things are closely connected. For the friar, reforms were the means of rebuilding a new identity for the city of Florence, intended to be the new center of Christianity. Based on charity and loyalty to the Holy Writ, the reformatory action of Girolamo Savonarola is far from being merely an inspiration: on the contrary, he has a definite, concrete project related to the historical circumstances. The first institutional initiative involved the status of the convent of San Marco and the organization of the Italian congregations: the separation of the convent from the Lombard Congregation of the Dominican Order (1492–1494). The cardinal Oliviero Carafa was involved in the separation process, but the Dominican Vincenzo Bandelli referred it to Ludovico Sforza, who strongly opposed this reformatory initiative: therefore, a Dominican internal issue became an Italian political question, with consequences for the relationship between Florence, Milan, and the papacy. Savonarola considered that a more rigid rule of life was necessary to accomplish his reformation project and strongly insisted on the necessity of distinguishing the San Marco convent from the rest of the Italian Dominican convents: Cardinal Carafa played a key role, succeeding in inducing the pope to sign the bull. In June 1493, the separation process was accomplished, and in November, Savonarola was elected Provincial Minister of the newborn Tuscan congregation; in August 1494, the convent of San Domenico of Fiesole and the convent of Santa Caterina of Pisa joined it. The most important innovations that he was able to introduce into the Florentine system are related to the banishment of the Medici in 1494 and the restoration of a proper republican

government in Florence: he promoted the enlargement of popular participation in the city government through the foundation of the *Maggior Consiglio* (Great Council) and the progressive dissolution of the Medicean judiciaries, such as the *Consiglio dei Settanta* (Council of the Seventy), created by Lorenzo in 1480 (Rubinstein 1966; Cadoni 1999). The *Consiglio del Popolo* and *del Comune* (Popular and Civic Councils) were the two organs that oversaw the election of the members of the Great Council. Savonarola promoted also the foundation of the *Monte di Pietà* in Florence in 1497, a charity institution that was relatively common in late medieval Italy, based on the principle of financial loans under favorable terms, mostly fostered by Mendicant orders. He successfully pushed for the reform of the Six Beans law, which granted the authority to condemn a citizen without the possibility of appeal. Savonarola was deeply involved in moral reform; he invited people to moderate their habits and (mostly women) dress properly; taking advantage of the confraternity network in Florence, he organized communities and groups of children according to Biblical and religious values (Polizzotto 2004; Eisenbichler 1998): during Carnival 1496, there was the first touching procession of children along the streets of Florence, a sacred representation showing how much Savonarola and his friars had invested in youth education (Ciappelli 1996), attempting to stop the violent inclinations of young people, so common in Italian Renaissance cities (Niccoli 1995).

We have a compendium of his idea of a republican state in *Trattato circa el reggimento e governo della città di Firenze*, written in 1498, a political treatise in the vernacular devoted to Florentine politics, as a result of his experience in the city (Savonarola 1965; Leonardi 1997). He felt the need to stress the danger posed by an oligarchic or, even worse, monarchist government for Florence, two institutional systems that lead necessarily to tyranny, as the Medici system has shown (Garfagnini 1998). The only form of government that could derive from Christian principles is a popular government. In the second part of *Trattato*, Savonarola emphasizes the description of the tyrant, which seems to have been inspired

by the figures of Piero de' Medici and his father, Lorenzo, especially with regard to the continuous suspicion of betrayal by family members and fellow citizens. Recently, a new element has been discovered, that is, that the description of the tyrant is taken directly from Book V of Aristotle's *Politics* (Tromboni 2012, pp. 278–279). The tyrant is the political symbol of sin and corruption, representing the corruption of the monarchy, as Aristotle himself stated. Since he is interested only in his own good and does not consider the common good, he is the exact opposite of a good governor: for this reason, a Christian government must avoid the threat posed by tyranny (Cadoni 1999, pp. 196–201; Leonardi 1997).

Philosophy, Theology, and the Holy Writ

The cultural profile of Girolamo Savonarola is formed by conventional elements and peculiar ones, as far as his status as a preacher is concerned. As a Dominican friar, he had a traditional education inspired by Thomism (see Thomism, <http://www.springerreference.com/docs/html/chapterdbid/187919.html>), and it is relatively easy to feel recurring echoes of Thomas Aquinas' doctrines and works in his sermons and treatises. Thomas' presence is substantial in two texts written by Savonarola during his first sojourn in Florence (1482–1487) for the friars in San Marco, where he was sent as *lector*: *Compendium philosophiae moralis* and *Compendium philosophiae naturalis* (Savonarola 1988). These texts are handbooks devoted to the explanation of philosophical concepts (moral and scientific issues) with the help of the doctrines of Thomas Aquinas and Albert the Great. Difficult to date, the two handbooks are associated with a third *compendium* about logic, *Compendium logicae* (Savonarola 1982). The Thomistic paradigm of Savonarola's thought is often evident in Girolamo's works, and the same can be said for Aristotelianism, a model to which Savonarola often resorts: recently, it has been highlighted that he had direct knowledge of classical philosophy. The friar was very familiar with Aristotle's works, which he possibly studied during his

youth, and also the Platonic dialogues: the proof of this direct knowledge is preserved in two collections of notes that have recently been edited, *De doctrina Platonicorum* and *De doctrina Aristotelis* (Tromboni 2012; Garin 1961; Verde 1998). Girolamo gathered notes, quotations, and brief summaries related to Aristotle's works, mostly according to the translation of William of Moerbeke, according to the translation by Marsilio Ficino (first edition, 1484): all of the original texts which Savonarola studied and worked on were preserved in the Library of San Marco in Florence. Among the Platonic notes, we find also a paragraph on *Commento sopra una canzone d'amore di Girolamo Benivieni* by Giovanni Pico della Mirandola, a polemical unfinished treatise written in response to Ficino's commentary on *Symposium* (Hankins 1990). Thanks to the study conducted on *De doctrina Aristotelis* and *De doctrina Platonicorum*, we can find several parallel passages in which the philosophical notes are employed, such as the description of the tyrant taken from Book V of Aristotle's *Politics* within *Trattato circa el reggimento e governo* of 1498. Savonarola's interest in classical philosophy needs to be well defined; it would be incorrect to present Savonarola as a pure philosopher, but we can turn up the light on his philosophical culture, so that the traditional image of a rude friar devoted uniquely to censure, penitence, and biblical preaching is prominently reshaped. The friar employs, on many occasions (sermons, vernacular, and Latin treatises), quotations and passages taken from, e.g., *Metaphysics*, *De caelo*, *Ethics*, and also pseudepigraphical texts, such as *Mundo* and *De proprietatibus*, to enrich his discourse and often explain and facilitate the understanding of theological and religious concepts. He often mentions the figures of Socrates, Plato, and Aristotle as the major intellects of antiquity and models of self-control and virtue.

Savonarola's concept of literature and poetry is clearly described in many of his best-known, most widespread works. In 1491, he wrote *Apologeticus de ratione poeticae artis*, a Latin treatise devoted to the learned segment of his public about the status of poetry and the difference between sacred and profane poetry (Savonarola

1982, I, pp. 209–272). *Apologeticus* was a response to *Carmen de christiana religione ac vitae monasticae foelicitate*, composed in 1491 by Ugolino Verino and dedicated to Savonarola, in which the author theorizes about the difference between these two kinds of poetry. Girolamo, however, was determined to retain his position and, in his work, affirms decisively that poetry and religion cannot share any common ground and that the place of poetry, as a discipline, is far removed from that of theology and religion. Savonarola's answer was directed not only toward Verino but also toward Marsilio Ficino, who celebrated the poetic furor of Plato's *Io* (Bausi 1996). For the friar, the sole text on which human beings are allowed to rely is the Holy Writ, and his whole action, the political, the pastoral, and the social one, derives from this belief: Ficino's attempt to integrate religion and philosophy was inconceivable for Savonarola. This rigid perspective seemed limited to many of his contemporaries, but Savonarola intended it to be a safe path to salvation to avoid sin and temptation. Despite that, many Florentine intellectuals got close to him, fascinated by the prophetic destiny of reform and rebirth he predicted for Florence, including Marsilio Ficino who, on several occasions before 1498, affirmed that Savonarola was a genuine prophet (Vanhaelen 2012). Giovanni Nesi (1456–1506), disciple of Ficino, composed *Oraculum de novo saeculo*, inspired by the friar (Nesi 2009); full of astrological and kabbalistic doctrines, the *Oraculum de novo saeculo* announced the beginning of a new era, as claimed by Savonarola. Girolamo and Domenico Benivieni, Benedetto Luschino (2002), Giorgio Benigno Salviati, and Zanobi Acciaiuoli were also among the friar's supporters. Giovanni Pico della Mirandola and Girolamo Savonarola were very close, especially in the last years of Pico's life; the Count of Mirandola took the Dominican habit in 1494 and was buried in the church of San Marco. His nephew, Gianfrancesco Pico della Mirandola, was a fervent *Piagnone* and wrote a biography about friars that widely spread, *Vita Hieronymi Savonarolae* (Vasoli 1996).

This intellectual affinity with Pico is evident in *Trattato contra li astrologi* (1497), which

Savonarola wrote to illustrate his precise position regarding one of the most common tendencies in Renaissance culture: astrology. Girolamo spoke often about the mistakes that men who believe in astrology can make and, in 1497, composed the *Trattato* (Savonarola 1988) which is, as claimed at the beginning of the text, a vernacular, simplified version of *Disputationes adversus astrologiam divinatricem*, a treatise by Giovanni Pico della Mirandola that was published posthumously in 1494. There are two key points in *Trattato*: astrology cannot foresee single contingent events and, in no case, can it replace divine prophecy; since antiquity, the major thinkers, e.g., Aristotle and Plato, condemned astrology and its use (Garfagnini 1992, 2004).

Impact and Legacy

Since 1490, fluctuating groups of supporters of Girolamo Savonarola have been born in Florence. As the friar gained importance and authority, the position of these groups crystallized, and they became incompatible with the opponents of the friar. On the one hand, the *Piagnoni* affirmed the sanctity of Savonarola and the reality of his prophecy: after his death, they considered him a martyr to a republicanism inspired by Christian religion. On the other hand, the *Arrabbiati* and Savonarola's detractors accused him of being a deceiver of the Florentine people, uniquely devoted to the pursuit of his own interests. Many people changed their attitude toward Savonarola and his reformation after his death: we recall here the example of Marsilio Ficino, who got very close to Savonarola during 1494 and 1495 and changed his opinion radically a few years later. In *Apologia contra Savonarolam* (Kristeller 1937, pp. 76–79), Ficino hurled abuse at the friar, claiming that he was a false prophet, a deceiver, and an antichrist, who seduced the Florentines with lies and false promises. The *Apologia* was written immediately after the execution in Piazza della Signoria and was addressed to the Cardinal College (Collegio dei Cardinali) explicitly to disassociate himself from the Savonarolian movement.

In March 1498, Niccolò Machiavelli heard Savonarola preaching in Piazza della Signoria:

he developed a complex (► “Reason of State, Renaissance Concept of”), refined opinion of the friar and included the Dominican in many of his works, such as *Discorsi sopra la prima Deca di tito Livio* and *Principe*, besides making several mentions of him in private letters and documents. Machiavelli was aware of the political appeal of Savonarola, and he included him among the prophets and legislators, such as Moses, Cyrus, Theseus, and Romulus, the founder of Rome. Nonetheless, they succeeded and Savonarola failed, since he was unarmed (*profeta disarmato*) and unable to control his followers once he constituted his new republic.

In later decades, several religious movements inspired by the Savonarolian reform grew in Italy, France, Germany, and later England. Martin Luther knew the works of Savonarola and translated some of his theological works into German.

For the Savonarolian movements in Italy and Europe, we refer to the studies of Polizzotto (1994) and Dall’Aglia (2006a, b, 2010).

François Rabelais University, Tours, France

Abstract

Florence of the Medici is well known for the incredible flourishing, in a relatively short period of time, of outstanding personalities in

all the fields of human practical and intellectual activities. It would be wrong to assume that this blessed period of Italian history and the history of the entire Europe would have reached such a glorious status without a whole range of minor functionaries and intellectuals that made possible the material organization and development of the city-state. Bartolomeo Scala was one of these individuals. He played an essential role in organizing some of the main political institutions of the Florentine political “state-apparatus.” His wide intellectual interests – which extended to some very specialized fields such as Epicurean philosophy, Neoplatonic mysticism, or geography and cosmology as well as more traditional humanist areas such as moral philosophy, political historiography, or religious thought – are a good example of the particular influence that the new cultural climate exerted in the shaping of early modern sensibility.

Biography

The son of a poor miller, Bartolomeo Scala studied law and letters under Carlo Marsuppini in Florence and then in Milan under the great Hellenist and Medici adversary Francesco Filelfo. In spite of that, he soon became a functionary at the service of the Medici and served from 1457 under Pierfrancesco de' Medici, a cousin of the main branch of the family.

In 1459, he was elected “cancelliere” – chancellor of the Guelph Party, one of the main institutions of the republican regime of Florence.

At the death of the patriarch of the dominant family in 1464, Cosimo de' Medici the Elder, real founder of the enduring power of the dynasty over Florence, Scala dedicated to him a collection of writings entitled *Collectiones Cosmianae*.

In 1465, Scala was elected Chancellor of the Comune, a charge whose significance was especially a cultural rather than a political one (Garin 1965).

His position in the Medicean milieu became more precarious with the ascent of the young Lorenzo, later to be called Il Magnifico (the Magnificent), in 1469.

The young ruler (who was also a poet, a philosopher, and a humanist in his own right) considered Scala a representative of the former generation, not in line with the new cultural policy that he and his circle intended to enforce in Florence.

Scala was the target of perhaps the most brilliant of the humanists that made up the court around Lorenzo, Politian (Angelo [Ambrogini] Poliziano), who derided his rudeness and his humble origins in an epode in iambic distichs edited in book XII of his correspondence (Letter 16).

After the Pazzi conspiracy of 1478, Scala was relegated to a marginal position and became increasingly close to the oligarchic opposition to Lorenzo, animated by another Lorenzo, cousin of the former, and son of the previously mentioned Pierfrancesco.

It is no surprise then, that after the inglorious fall of Piero, son of the Magnifico, in 1494, after the French troops of King Charles the VIII entered Florence, Scala was soon reintegrated in his appointment as Chancellor and retained it throughout the moralist and pious regime of the Dominican preacher Girolamo Savonarola (1494–1498).

Impact and Legacy

Scala's main original works were not printed during his lifetime but were known and quoted by some prominent humanists.

Besides the *Collectiones cosmianae* already mentioned earlier, which are a collection of funeral orations, he composed a book of moral and philosophical apoloques, *Apologi centum*, to which he added a hundred more apoloques at the end of the 1480s. They deal with very popular and frequently discussed themes of the period: religion, superstition, fate, and fortune (Brown 2018).

He also manifested interest in the philosophical speculations and some early influence of Lucretius and Epicurean philosophy in general, as can be seen in two of his early works, the *De sectis philosophorum* (1458) and the *Dialogus de consolatione* (1463) written to mourn the death of Cosimo's second son Giovanni. His proximity to the Neoplatonic philosopher Marsilio Ficino

can be seen in his more mature works such as the already mentioned *Apologi* (1481) and the important dialogue on public law *De legibus et iudiciis dialogus* (1483), which establishes the superiority of natural laws over positive ones (Brown 2018).

Scala's main works were, nonetheless, of a historical nature. In 1483 he wrote a *History of the Florentine People* (*Historia Florentinorum*), which he revised and corrected 4 years later and which was published in Lyon as late as 1723. His *Apologia contra vituperatores civitatis Florentiae* (Defense of the City of Florence against its Prosecutors), composed in 1496, states the political importance of religion and prophecy in ruling the state and defends the particular kind of republican popular ideology that Florence experienced during the 4 years of the Savonarolian Regime.

These works testify to the difficulties for a representative of the glorious season of Florentine civic humanists who had also written histories of the city to go on defending republican ideals (Hale 1977). This especially in a context where, under the pressure of the economic and political circumstances, these ideals had lost any realistic consistency, as Niccolò Machiavelli would show so clearly in his political essays at the beginning of the sixteenth century.

Universität Klagenfurt, Klagenfurt, Austria

Abstract

Julius Caesar Scaliger was an Italian physician who practiced medicine in Agen and produced a highly diverse literary output that documents both his interest in humanistic studies and in Aristotelian natural philosophy. He is one of the foremost Renaissance scholars on literary history and theory, produced massive commentaries on ancient botanic and zoological works, and authored a 1000-page critique of Girolamo Cardano’s natural philosophy. As far as matter theory is concerned, Scaliger combines the

traditional doctrines of minimism – the view that substantial forms require a minimal portion of suitably structured matter – and “Latin pluralism” – the view that composite substances such as living beings possess a plurality of substantial forms standing in relations of subordination – with numerous corpuscularian explanations of natural phenomena derived from the corpuscularian aspects of the Aristotelian *Meteorology*. However, Scaliger also departs from a central tenet of the Aristotelian tradition, namely, the view that ascribing essences to living beings implies that plants and animals cannot give rise to beings of a different biological species. Contrary to species fixism, Scaliger argues that the conception of a plurality of substantial forms in the bodies of living beings could provide an explanation for how, in singular cases, living beings can arise that belong to a species that did not exist before.

Biography

Julius Caesar Scaliger was a kind of impostor who managed to become one of the leading members of the republic of letters of his age. He is famous for his probably entirely confabulated curriculum vitae according to which he belonged to the noble family of the Scaligers of Verona and had studied with five of the most famous philosophers of his time (see Hall 1950). None of his biographical claims is confirmed by any extant documents (see Kristeller 1952), and ever since his lifetime there has been detective work going on to discover his real identity (see Richards 1962; Billanovich 1968). All that seems to be reasonably certain is that, after around 1525, Scaliger practiced medicine in Agen and produced a literary output that was both wide-ranging and influential. He composed one of the most highly regarded sixteenth-century studies of Latin grammar (Scaliger 1540; see Jensen 1990a, Chap. 5), wrote Neo-Latin poetry (Scaliger 1533, 1546, 1574), reflected on wisdom and happiness (Scaliger 1573), attacked Erasmus’s adoption of Cicero as a universally valid literary model (Scaliger 1999), and speculated about the

interpretation of dreams (Hippocrates 1539; see Haugen 2007; De Smet 2008). The philological side of his work was very prominently continued by his son, Joseph Justus (1540–1609) (see Grafton 1983).

Heritage and Rupture with the Tradition

Philological and philosophical interests come together in Scaliger's works on poetics (Scaliger 1539, 1561, 1994–2011). One aim of these works was to provide practical guidance for the production of poetry and drama through an extremely detailed analysis of the techniques of rhythm, verse, and figures of speech in classical Latin and Neo-Latin works. Perhaps the most innovative aspect of the *Poetices libri septem* consists in its pioneering contribution to several fields in the liberal arts that were beginning to emerge in Scaliger's time: literary history, comparative literature, and literary criticism. As to literary history, he develops conjectures concerning how poetry developed out of aspects of the popular culture of ancient Greece (see Bizer 1994). As to comparative literature and literary criticism, he compares works from ancient Rome with Neo-Latin poetry of his contemporaries, often in a highly subjective and opinionated way (see Reineke 1988). When it comes to the philosophical tenets of his poetics, most of what Scaliger says turns out to be derivative of Aristotle's *Poetics*, Horace's *Ars Poetica*, and Marco Girolamo Vida's *De arte poetica* (Vida 1527). With Aristotle, he shares the view that the imitation of nature is central for art in general and for poetry in particular (see Brinkschulte 1914, 46–51). With Aristotle and Horace, he shares the view that for portraying the essential qualities of humans a certain idealization of characters is required. In his view, what has to be observed is the coherence or "harmony" of characters, which at the same time has to remain within the limits of what will appear psychologically plausible (see Brinkschulte 1914, 51, 83–85). With Vida, he shares the view that giving a depiction of idealized nature works best by imitating Vergil, whose representation of reality Scaliger regards as a "second nature" (see

Rolfes 2001, 204–207). In one respect, however, Scaliger moves beyond his sources, as Walter Benjamin has emphasized (Benjamin 1972, 98–99). While Scaliger shares Aristotle's view that art is a disposition that is directed toward the goal of acting (Aristotle 1968, 1140a10; Scaliger 1994–2011, 2:78), he ascribes to affects a role that is not found in any of his sources: "The poet teaches actions through affects, such that we may embrace the good ones for acting and detest the bad ones with a view to abstaining from action. Hence, the action is a way of teaching the affect, which is taught for the purpose of acting. Therefore, the action will be . . . an exemplar or instrument in the fiction, the affect a goal" (Scaliger 1994–2011, 5:500).

In natural philosophy, Scaliger produced massive commentaries on the pseudo-Aristotelian *On Plants* (Scaliger 1556), to Theophrastus's *On the Causes of Plants* and *Natural Histories* (Scaliger 1566, 1584), as well as a translation of and commentary to Aristotle's *History of Animals* (Scaliger 1619; see Jensen 1986; Perfetti 2000, 155–181). His masterpiece, the *Exoteric Exercises* (1557), is a 1000-page book review of Girolamo Cardano's encyclopedic *On Subtlety* (1550). In spite of its chaotic organization, Scaliger's book was widely used in the Protestant university curriculum (see Jensen 1990b) and triggered two book-long responses by the Marburg-based philosopher Rudolph Goclenius (see Goclenius 1594, 1599). In the *Exoteric Exercises*, Scaliger develops a version of corpuscularian Aristotelianism that proved to be an important step toward the corpuscularian philosophy of the seventeenth century. This aspect of his thought can be documented in two fields that he discusses in detail: the theory of matter (see Emerton 1984, 90–102; Lüthy 2001; Blank 2008; Sakamoto 2016) and the theory of biological reproduction (see Blank 2010, 2012). Scaliger's philosophical writings also contain some remarks concerning traditional topics in philosophy of language. For instance, he adopts the medieval theory of mental signs to explain the origin of the signification of linguistic signs, as well as the nominalist view according to which universals are the result of a process of abstraction from particulars (see Jensen

1990a, Chap. 4). One also finds sketchy remarks concerning the philosophical interpretation of the Trinity, where the divine intellect, divine self-reflection, and divine self-love are understood as the three aspects that can be distinguished in the divine being (see Sakamoto 2010).

Innovative and Original Aspects

Arguably, Scaliger's greatest significance for the history of philosophy lies in his contribution to natural philosophy. In this field, he uses the traditional idea of minimism, according to which natural minima are a lower limit of matter beyond which a given form cannot be maintained (Scaliger 1557, fol. 28v; on minimism, see Emerton 1984, 90–91). Scaliger suggests a minimalist definition of mixture, when he writes: "mixture is the motion of the minimum bodies so that union is achieved" (ibid., fol. 143v). He argues that experiment shows that there are mixtures of heterogeneous substances which turn out to be inseparable from each other (ibid., fol. 148v). The conclusion that he draws is ingenious. On the one hand, he maintains that in mixture minimal parts form a continuum. On the other hand, since in the case of heterogeneous substances the forms of the minimal parts are different from each other, he suggests that in the most basic cases (such as the mixture of water and wine) the constituents of the mixture retain their numerical identity since they retain their form, even if they give up their boundaries (ibid., fol. 144rv).

Even if his *minima* thus do not behave in a fully corpuscularian manner, Scaliger derives corpuscularian explanations of the other phenomena from the Aristotelian *Meteorology*. For example, Scaliger mentions a passage from the second book of the *Meteorology*, according to which hot vapors of water get colder by getting mixed with cold particles of air (ibid., fol. 20r; see Aristotle, *Meteor.* II, 2, 354b24–33). Similarly, he points out that, according to the first book of the *Meteorology*, the parts of the world are one not by means of continuity but by means of connection (*coaptatione*), in the sense that the supralunar bodies are efficient causes the effects received by

the sublunar bodies (Scaliger 1557, fol. 19r; see Aristotle, *Meteor.* I, 2, 339a11–24). Scaliger also proposes a corpuscularian explanation of the phenomena occurring when a piece of lime is immersed partly in water. As he argues, water rises in lime beyond the level of the water into which the piece of lime is immersed; hence the air included in the upper part of lime is already in the sphere of air (Scaliger 1557, fol. 9r). Scaliger distinguishes between attraction (*attractio*) and succession (*subitio*). According to his view, attraction happens by means of an external force. This, however, is not what happens in cases such as water rising in lime. Rather, "a body that succeeds another body (such as a particle of water succeeding a particle of air in the pores of lime) is moved by an internal form of its own . . . , namely, a secondary one, such that no vacuum occurs. For elements not only strive towards their own WHERE, but they enjoy themselves outside their natural place, such that in order to avoid serious harm to the universe the place at which they are is not occupied by the most terrible enemy. In fact, nothing is more hostile to being than nonbeing. But vacuum is a non-being" (ibid., fol. 25r). Hence, bodies are not only preserved by their form, they also move due to their form in a way such that no vacuum occurs.

Puzzlingly, however, Scaliger also claims that "[i]n nature a vacuum exists necessarily. For otherwise, either there would be no motion or one body would penetrate the other" (ibid., fol. 6v). Did he hold inconsistent views concerning the existence of a vacuum? Clearly, he rejects the idea that matter is interspersed with *microvacua*, as is indicated in his discussion of the phenomena of rarefaction and condensation. On the level of elements, Scaliger embraces an Aristotelian conception of rarity and density according to which rarity and density are contrary qualities that, at different times, can be possessed by the same portion of matter. By contrast, there is a strongly corpuscularian strand in Scaliger's conception of rarity and density on the level of composite bodies. He holds that a body is rare if between its parts there are parts of another, less solid kind, like air or water in a sponge (ibid., fol. 112r). Consequently, he makes it clear that he

does want his notion of vacuum to be understood “in the way of the Ancients”: “For they supposed a vacuum without body. But we maintain a vacuum in which there is a body. Vacuum and place are the same: and they do not differ except with respect to the name” (ibid., fol. 6v). As he explains, place “is in some way a being, and in some way a non-being. It is a non-being, because a being is contained there; and it is a being, because it is something that belongs to something else, namely, a cavity within a body” (ibid., fol. 7r). Thus, although Scaliger embraces a theory of container space, he also thinks that portions of space are always occupied by some portion of matter or other.

Scaliger uses the idea that the forms of constituents of mixtures remain intact even when elements have formed a physical continuum in his theory of biological reproduction. According to his view, some processes of biological reproduction can be understood within the theory of species fixism that was traditionally understood to be a consequence of Aristotle’s views on the essences of living beings (see Hull 1965). At the same time he holds that, in some cases, new biological species can arise. According to his analysis of the former kind of processes, “things that already exist are mixed: such that they will not be inwardly and simply new; for they are made out of those that already exist, as it were, as out of parts: which we see happen in graftings which did not exist before” (Scaliger 1557, fol. 319v). Unfortunately, Scaliger never discusses what is going on in grafting in much detail. However, there is a related case, which he also conceptualizes in terms of “mixture,” namely, the cross-breeding of animals. His account of cross-breeding is firmly placed in the context of his conception of a plurality of substantial forms in each living being. In this respect, he takes up a long tradition from medieval philosophy that is sometimes called “Latin pluralism.” According to the basic insight shared by the members of this tradition, in each living being there is a single dominant substantial form and a large number of subordinate substantial forms that actualize subordinate body parts. Scaliger understands the subordination relation as a relation of final causation

(ibid., fol. 144v). Some material objects and some forms are less “noble” than others because they are made for the sake of other material objects and other forms. With respect to the structure of living beings, the picture that is suggested by this passage would be the view that bodily organs such as a nose or an eye, as well as their respective forms, are less “noble” than the entire body of the living being and its soul because they are made for the sake of the entire body of the living being and its soul. In this sense, subordinate forms that are all teleologically directed towards the dominant forms can be said to be “mixed” and to form a unity (ibid.) (On Scaliger’s psychology, see Gligioni 1999).

The second sense in which, in Scaliger’s view, the possibility of new species can be understood is meant to go beyond the newness that can be achieved by grafting. According to this second sense, new species “are in the potency of an agent . . . For a rose can be produced which did not exist before. But there is always something there, because it is in the potency of the rose bush” (ibid., fol. 319v). Unlike the plants arising from grafting, such a plant belongs to a species that is “simply” and “inwardly” new; but nevertheless, such plants are characterized as the result of something that is “already there” in the potency of an existing plant. The example given by Scaliger is certainly bewildering because, from a contemporary perspective, a new variety of roses would not be a plausible candidate for a new species. Nevertheless, even if the example is chosen inconsiderately, what Scaliger has in mind is the question of species membership. In his view, the question “[w]hether new species, which never before existed, can be generated?” boils down to the question “[c]an a new form arise that shapes matter for its own purposes?” (Scaliger 1566, 16). Species change, in his view, takes place when water-mint changes into mint (ibid.). As he explains: “When mint changes into water-mint, or vice versa, this happens due to the affinity of forms; and if the species differs also matter differs” (Scaliger 1557, fol. 386v). Commenting on Theophrastus, he takes darnel to be a case in which a plant of one species has its origin in the corrupted seed of a plant of a different species

(Scaliger 1566, 230). The corrupted seed no longer carries the form of the plant from which it originated. But it is also not altogether different from the form of the plant from which it originated. It seems most plausible to understand these claims in the context of Scaliger's conception of a plurality of substantial forms in living beings. If this is what Scaliger has in mind, what underlies his account of species mutability is the view that domination relations between substantial forms can break down such that a previously subordinate form becomes the substantial form of a new living being.

Schegk, Jacob

Born: 7 June 1511 Schorndorf

Died: 9 May 1587 Tübingen

Günter Frank

Europäische Melanchthon-Akademie Bretten,
Bretten, Germany

Abstract

Schegk was the first Lutheran Aristotelian at Tübingen. Because of his broad learnedness, he became involved in many philosophical-theological disputes in his lifetime. With Petrus Ramus he was struggling over Aristotle's understanding of science. Whereas he was debating over the subject area of metaphysics with the Italian philosopher Simon Simonius, he became part of the antitrinitarian controversy after the critique of the Sorbonne theologian Gilbert Génébrard. At the end he earned personal animosity among Lutheran theologians in Tübingen because of his critique of Luther's doctrine of ubiquity.

Alternate Names

[Degen, Jakob](#)

Biography and Oeuvre

Schegk studied ancient literature, history, mathematics, and Aristotelian philosophy at the University of Tübingen from 1527 (for his biography see Sigwart [1889](#)). Upon completion of his M.A. (*-magister artium*) on 26 January 1530, he entered the faculty of theology and studied Thomas Aquinas and Duns Scotus. Owing to the unrest caused by the introduction of the Reformation in Württemberg in 1534 by Duke Ulrich, Schegk gave up theology and changed to medicine. At the same time, he was commissioned by the Senate to teach Aristotelian philosophy. Schegk rarely left Tübingen and then only to avoid the various

plagues. The philosophy of Aristotle became his lifework around which he based his extensive oeuvre. It was his work with Aristotelian logic that made him one of the fiercest opponents of Petrus Ramus. In his *Perfecta et absoluta definiendi ars* in 1556 and more notably in his extensive treatise *De demonstratione libri XV* in 1564, Schegk defended the scientific teachings of Aristotle's *Posterior Analytics* against the critique of Petrus Ramus' dialectics. The arguments used in the various disciplines are set out in the topical section of the dialectics, whereas the various demonstrations of the sciences are presented in the analytics (Breidert 2003). Schegk became involved in a dispute over the Lutheran doctrine of ubiquity with the Lutheran theologians Johannes Brenz and Jakob Andreae, which then broadened to encompass the debate with the Italian Simon Simonius on the definition of the subject area of metaphysics and its relation to experience (Frank 2015). In this debate, which spans the publication of *Responsum [...] ad Simonis Simonii libellum* in 1568, *Simoni Simonio meliorem mentem* in 1571, *Anatome* in 1572, and his great work *Antisimonius* in 1573, Schegk regarded himself as the first Thomist Lutheran who comprehended the unity and universality of metaphysics on the grounds of its analogous relationship to a prime analogate, defined as $\pi\rho\delta\varsigma\ \acute{\epsilon}\nu$ by Aristotle. As a philosopher, he became similarly involved in discussions on the emerging concept of antitrinitarianism. Triggered by the criticism of the Paris theologian Gilbert Génébrard, who shifted Schegk closer to the Swiss antitrinitarians because of his supposedly modalistic doctrine of the Trinity, he developed in his trinitarian writings *Contra Antitrinitarios* (1566), *Antilogia* (1568), and *Apologeticus* (1573) the notion that the inner divine hypostases are not accidents, but rather powerful *potentiae*, a term that Schegk borrowed from the metaphysics of Aristotle (Met. Δ 12 a 1f., 1019a). Just before giving his final lecture at the university on 29 May 1577, the same year he became totally blind, Schegk completed his great commentary on Aristotle's *Topics* on which he had labored for 11 years. When this commentary finally appeared in print in Lyon in 1584, a storm of indignation once again broke out among the Tübingen

theologians. Opponents interpreted this publication as proof that Schegk saw the Lutheran doctrine of ubiquity as an example of false definitions and conclusions. On 4 July 1585, Schegk made an official confession, professing his belief in the Lutheran doctrine of ubiquity, under the supervision of the university provost Jakob Andreae, rector Jacob Heerbrand, and four deans. The confession was then published in the same year under the title *Admonito*.

Abstract

The German Lutheran philosopher and theologian Christoph Scheibler is considered to be “the Protestant Suárez.” Among his main

works are the collected logical works *Opus logicum* (1620) and his *Opus metaphysicum* (1617), one of the most comprehensive writings on metaphysics in Protestantism. He was well known for his recourse to the entire philosophical tradition, which encompassed not only the Aristotelian, but also the Platonic tradition. Although Scheibler did not find his own school, he paved the way for an international reception of the Lutheran school of philosophy through the publication of his works in Switzerland and England.

Biography

The German Lutheran philosopher and theologian Christoph Scheibler studied in Marburg and Gießen where he acquired his master's degree in 1607. In 1610 he became a professor of Greek, later of logic and metaphysics. Scheibler wrote many philosophical writings in the Aristotelian tradition before, in 1624, he became superintendent and gymnasiarch in Dortmund where he died. Particularly important are his works on logic and metaphysics.

Between 1613 and 1619, Scheibler published four works on logic (*Introductio logicae, Topica, De propositionibus sive axiomatibus, De syllogismis et methodis*), which he collected under the title *Opus logicum* in 1620. Scheibler's recourse to the entire philosophical tradition is particularly significant. Another feature is his attempt to combine the rather antithetic theories of Peter Ramus and Jacopo Zabarella in a synthesis.

Scheibler defined logic, which he considered being equivalent to dialectic, in the Ramistic tradition as "the art of discussion of any being" (*ars bene disserendi de quovis Ente*). Nevertheless, he integrated Zabarella's description of logic as an instrument and intellectual habit into his own definition. Scheibler's contribution to modal logic is important. He considered it necessary to judge the status of statements – whether they should be regarded as true or false, necessary or contingent, possible or impossible. This was not only applied to the field of philosophy but also to theology. In his *Opus metaphysicum*, published in 1617, Scheibler also underlined the benefits of

metaphysics, in particular for theology, due to its use of philosophical concepts (nature, substance, character, cause, etc.) for specific theological explanations and doctrines. Scheibler utilized Jakob Martini's division of metaphysics into *metaphysica generalis* and *metaphysica specialis*.

The first part examines being in general and its properties, whereas the second part covers the dichotomy of substance and accident. The classification of substances into corporeal and incorporeal opens the field for natural theology, where Scheibler is discussing God, angels, and the separated soul (*anima separata*). As a result, Scheibler ignored Benedictus Pererius's proposed separation of metaphysics as natural theology from first philosophy as a pure ontology. For the Lutheran tradition, Abraham Calov came to this conclusion a few years later.

Scheibler defined metaphysics in the spirit of Francisco Suárez as a "science of being, insofar as it is abstracted from its materiality." He counted not only the real being but also the mere being of reason (*ens rationis*) in the subject matter of metaphysics. The desire to clarify important Trinitarian and Christological terms is a striking feature of Scheibler's work.

As early as 1611, Scheibler published a systematic treatise on the doctrine of the soul (*De anima*). In that treatise, Scheibler as a *philosopher* stated that "our soul is transitory and mortal by its nature," more or less as in the wake of Pietro Pomponazzi, whereas Scheibler as a *theologian* postulated the soul's immortality "from grace" (*ex gratia*). A complete edition of the most important philosophical writings appeared posthumously in 1657. Scheibler did not find his own school. However, his writings were printed not only in Germany but also in Switzerland and England, and it could be argued that Scheibler paved the way for an international reception of the Lutheran school of philosophy through the publication of his works.

Abstract

The philosopher and physician Philipp Scherb is considered to be an important representative of Renaissance Paduan Aristotelianism at the Altdorfer High School. Scherb taught the whole branches of philosophy (including logic, ethics, politics, and metaphysics) and medicine. During his academic life, Scherb published just a few texts, but had a far stronger impact on his students, including Michael Piccart and Caspar Hofmann. He was particularly known for his teaching skills and for interpreting the Aristotelian writings.

Biography

The philosopher and physician Philipp Scherb is considered to be an important representative of Renaissance Paduan Aristotelianism at the Altdorfer High School (*Academia Norica*). He was born in Bischofszell in Switzerland and studied in Heidelberg, Basel, and particularly Padua where he met Francesco Piccolomini and Jacopo Zabarella. Scherb taught logic, ethics (as successor to Thomas Erastus), and medicine in Basel from 1581 to 1586. In 1586, Scherb was appointed professor of medicine in Altdorf where he remained until his death in 1605. He taught courses in logic, politics, physics, and metaphysics. During his academic life, Scherb published just a few texts, but had a far stronger impact on his students, including Michael Piccart and Caspar Hofmann. He was particularly known for his teaching skills and for interpreting the

Aristotelian writings. They were regarded as obscure and difficult in clarity, but Scherb defended the “pure” Aristotle against all deviations and distortions. In his *Dissertatio pro philosophia peripatetica* from 1590, he fought against Peter Ramus’ critique of Aristotle. Ramus had reduced Aristotelian logic, with its categories and doctrine of proof, to a dialectic and claimed that the Aristotelian metaphysics was a pile of logical tautologies. As a consequence, Scherb blamed Ramus for blurring the difference between the arts and sciences, and he defended philosophical freedom against a premature commitment to a “sacred truth.” Perhaps it was this *libertas philosophandi* (freedom to philosophize), the refusal to accept theological restrictions, that reminded Nicholas Taurellus, Scherb’s philosopher colleague in Altdorf, too much of Andreas Cesalpino. Such an influence, however, can hardly be reconstructed from Scherb’s writings. Scherb published the *Theses philosophicae* in 1603, and his commentary to Aristotle’s politics was published after his death, in 1610.

Although Scherb did not establish a separate school in the strict sense of the term, his influence can be traced quite a few places. Piccart’s *Isagoge in lectionem Aristotelis* from 1605, for example, provided an introduction to the entire Aristotelian work. It contained, among other things, the important speech *De ratione interpretandi* and a rearrangement of the books of Aristotle’s metaphysics. It is undoubtedly influenced by Scherb.

Piccart emphasized the autonomy of philosophy, too; it should not be “twisted” by theological dogmas. In addition, Hermann Conring had on occasion emphasized the importance of Scherb’s philosophy. The existence of a specific Altdorf philosophy was made evident by Johann Paul Felwinger with his eponymous anthology, containing the disputations of Scherb, Piccart, and Ernst Soner. A full appreciation of Scherb’s philosophy is still pending.

Abstract

Georgios, Gennadios II (Scholarios), was the first Ecumenical Patriarch of Constantinople

(1454–1456) after the capture of Constantinople (1453) by the Ottomans, an anti-unionist, an Aristotelian, and surprisingly a Thomist. He was committed to theology, but he also studied, taught, commented on, and engaged in philosophical arguments. He was a member of the Greek delegation at the Council of Ferrara-Florence (1438–1439), a Byzantine author marked by abundant inventiveness, a monk, and an opponent of everything that contradicted the faith of Roman Orthodox Church (Platonism of George Gemistos-Pletho, new theological trends, a union of expediency, the Ottoman threat, etc.). Scholarios embraced Thomas' scholasticism because Thomas also promoted the view that philosophy does not contradict theology. He regards Thomas to be infallible in most theological matters except those that are not in accord with Roman Orthodox Church. He composed theological and philosophical treatises, studied and commented Aristotle's works, translated scholastic writings, and synthesized epitomes. Scholarios is one of the last great representatives of Byzantine learning because he articulated an authentic approach to theology based upon the Christian patristic tradition and philosophy.

Biography

There are various and turbid pieces of information about Gennadios II Scholarios' (c.1400–c.1472) name, origin, place and time of birth, and character, but there are mostly many contrasting opinions about his life intentions. The Byzantine author, professor, and scholar became the first Ecumenical Patriarch after the fall of Constantinople (1454–1456), and he was enthroned in 1454 by Mehmed II the Conqueror (1432–1481). Although his fame rests principally on his

patriarchal activity and his anti-unionist attitude, recent research is mainly interested in the reception of Thomas Aquinas' oeuvre. There are many different spellings attributed to his name, but the name mostly used is George Scholarios or Gennadios.

He was born somewhere between the years 1398–1403, although modern scholarship accepts 1400 as the most probable year of his birth. The sources indicate that his birthplace was Constantinople. In his work *Refutation of Jewish error* (*Ἐλεγχος τῆς ἰουδαϊκῆς νῦν πλάνης ἐκ τε τῆς Γραφῆς καὶ τῶν πραγμάτων καὶ τῆς πρὸς τὴν χριστιανικὴν ἀλήθειαν παραθέσεως: ἐν σχήματι διαλόγου*), he notes that his native country was Thessalia. It is believed that he grew up in a rich family, but his parents died at an early age.

Scholarios was ordained as a professor of theology in the palace, and he organized theological discussions in the presence of the royal family, courtiers, and various audiences. He was established as General Judge of the Romans, as judicial officer, and as General Imperial Secretary. These positions paved the way for his political and ecclesiastical career. The Byzantine Emperor, John VIII Palaiologos, requested him to contribute to his unifying policy. He accompanied the Emperor at the Council of Ferrara-Florence and worked with Bessarion (1400/1408–1472), who was at that time Metropolitan of Nicaea of the Roman Orthodox Church. The purpose of the council to discuss the reunion between the Roman Catholic Church and the Eastern Orthodox Church that had been separated since the Schism of 1054.

After the enthronement of the last reigning Byzantine Emperor Constantine XI the Palaiologos (1449), Scholarios was removed from his duties and began his monastic course. He retreated to the Monastery of Charsianitos, somewhere between the years 1449–1452. According to the Byzantine historian Georgios Sfrantzis, Joseph Bryennios (c.1350–1430/1438) was appointed teacher to the Monastery of Charsianitos during this period. The name "Gennadios" was subsequently given to him.

Many of Scholarios' autographs that are written in the years of his patriarchy are signed under the title *ταπεινοῦ μοναχοῦ Γενναδίου* (*Humble Monk Gennadios*) which indicates his monk

name. He continued to use this name after his ascension to the Patriarchal throne and until the end of his life. The books which are signed by the name Gennadios Scholarios are written at the time he was at the monastery and thereafter. After the Fall of Constantinople, he was arrested by the Ottomans and transferred to Adrianople. It is said that Mehmed II the Conqueror allowed the election and ordination of a Patriarch, granting him considerable privileges. The sultan let the Orthodox Romans designate a patriarch and they elected Scholarios. As the Ecumenical Patriarch, Scholarios used the signature: *Γεννάδιος μοναχός καὶ Πατριάρχης τῶν τοῦ Χριστοῦ πνήτων* (*Monk Gennadios and Patriarch of the poor*).

The Sultan granted him the Church of the Holy Apostles and gave some privileges to establish the Patriarchate, which was instituted to represent the enslaved Orthodox Christians. The Patriarchate was soon moved after Scholarios' request to the Pammakaristos Monastery. Scholarios resigned in 1456 pleading health reasons. There is a possibility that two re-instatements to the Ecumenical Throne took place, in 1462 and 1464, but without any proof that he had re-performed the duties of the Ecumenical Patriarch.

He retired to the Monastery of Vatopedi on Mount Athos and then to the Monastery of John the Forerunner on Mount Menoikeion near Serres. Many years after his death his relics were buried in the monastery.

His tenure as patriarch, albeit brief, is considered to be of great importance, laying the foundations of the continued existence of the Ecumenical Patriarchate within the framework of the Ottoman Empire.

Education

Scholarios received his basic knowledge from various scholars of his time and declares that, with great personal effort, he gained a thorough knowledge of rhetoric, philosophy, and theology. Furthermore, he studied the "old teachers," i.e., the philosophers, and their writings in order to learn the "brilliant doctrines of philosophy," especially Aristotelian.

There are reports that Mark of Ephesus (c.1394–1445) was his teacher, along with Joseph

Bryennios and Makarios Makres (c.1383–1431). Scholarios, in an epistle to Mark Eugenikos, refers to him as his teacher, despite the age gap of only 9 years. In fact, Gennadios wrote a eulogy for Mark in which he declares his love, admiration, and respect and addressed him as his teacher and mentor. John Chortasmenos (1370–1437), Aristotle's commentator and representative of the old generation of Palamism, was the teacher of Scholarios, Bessarion, and Plethon. Scholarios may have attended the lessons of Damaskinos, Theocritus, jurist Methodios, George Gemistos-Plethon (c.1355–1454), and Simeon of Thessaloniki.

Scholarios appears to have received the stimulus for the teaching of Thomas Aquinas by his teachers. It must be taken into account that the monk Joseph Bryennios had studied Thomas Aquinas' works and denounced some of his theological ideas. An example is the detailed report on the issue of the emanation of the Holy Spirit during the discussion between Bryennios and Maximos Chrysoverges (? – 1410/1429). Bryennios was aiming to overturn the arguments of Maximos, who was a Dominican monk and follower of Thomas. Bryennios' argument is related to the difference between philosophy and theology. According to Scholarios' teacher, the process of emanation of the Holy Spirit cannot be approached by intellect. Thus, from his perspective theology is beyond "all arts and sciences." John Chortasmenos had a humanistic education, beyond his mathematical, philosophical, and theological knowledge. He was also known for his astronomical and philosophical writings as well as for his translations. He is thought to be one of the greatest intellectuals of the Palaiologan era. Some later scholars call him Latinophile, although he opposed the Florentine Union. There is no evidence that Scholarios was stimulated by the teachings of Aquinas by Chortasmenos, even though the information which derives from Chortasmenos is that Mark Eugenikos received an excellent education in logic and philosophy.

In an epistle to Scholarios, Mark of Ephesus claims that he forgot many philosophical views, but it seems that during Scholarios' teaching with

Mark, they dealt with many philosophical topics. This is confirmed by two events. Firstly, Mark, in his last speech, interprets propositional logic, i.e., possible and necessary propositions and the appropriate arguments based on them. Secondly, Scholarios dedicated the defense of Aristotelianism against Pletho's Platonism to Mark. In any case, they were both engaged in philosophical and theological matters. Scholarios addresses Mark as a spiritual father and a teacher. On the other hand, Mark declares his fatherly love and friendship for Scholarios, and he regards him as the only scholar of his time who is capable to preserve the right beliefs from those who questioned the accuracy of the Orthodox doctrines.

Teaching Activity

There are reports that Scholarios was teaching in a private school the works of Thomas Aquinas, even though his theological works had raised many objections in the past by many Byzantine scholars such as Nilos Kavasilas (c.1298–1363). Scholarios also founded the Patriarchal Academy in Constantinople, where he gave lectures about grammar as well as rhetoric. The Patriarchal Academy was the continuation of the Patriarchal School, or Patriarchal Academy or also known as "Great Step," which was founded in the ninth century. The school was re-founded by Gennadios in 1454, and for a few decades Matthew Kamariotes (d. c.1490) oversaw its operation by being the first director (1454–1489). It was an institution that at the beginning lacked organization, resources, and impact. Thereafter it operated almost uninterruptedly and is considered to be the oldest educational institution of Hellenism.

Legacy and Rupture with the Tradition

Scholarios and the Council of Ferrara-Florence

Scholarios' attitude toward the problem of Union between the Greek and Latin Churches was based on the concern about the feasibility and the expediency of the Orthodox participation in the forthcoming council. The Byzantines had reservations about the Union which aimed mostly at a

conventional and cooperative association to provide economic and military assistance due to the Ottoman threat. There are several views about Scholarios' attitude toward the union. Some claim that he supported it and others that he did not. At first, Gennadios supported a true dogmatic union, but when he lost his hope that this kind of union was ever possible, he worked to prevent it. As he says in the title of a work considering the Union [...] *there must be a union of dogma and not peace of expediency, as some desire* [...] (Τοῦ αὐτοῦ κῆρ Γεωργίου τοῦ Σχολαρίου πρὸς τὴν οἰκουμένην σύνοδον ὑπὲρ εἰρήνης· ὅτι δογματικὴν ἔνωσιν δεῖ ποιεῖν, οὐκ εἰρήνην οἰκονομικὴν, ὥς τινες βούλονται, καὶ τίς ἐστὶν αἴτιη). When he retired to the monastery, he wrote an apology in which argued that the reason for his negative attitude was the disenchantment of his expectations from the Catholic Church. Moreover, the fact that Scholarios never accused the Latins of heresy, despite their dogmatic errors, is attributed to his Thomism as well to his appreciation for Latin theology.

The Philosophical Rivalry Between Scholarios and George Gemistos Pletho

Scholarios opposed both the union and the religious Platonism of George Gemistos Pletho. Pletho opposed also the union, but while in Florence, he had the opportunity to disseminate his views about Plato to the Italian humanists. This led to the writing of *De differentiis* (Περὶ ὧν Ἀριστοτέλης πρὸς Πλάτωνα διαφέρεται), in which he questioned the widely recognized authority of Aristotle. He also advocated the view that Aristotle was fallacious on several counts and ignorant regarding the greatest theological issues (περὶ τὰ μέγιστα ἀμαθῆ), such as divine creation. Pletho intended to create a revitalized Hellenic religion that aimed to disarm Orthodoxy because he believed that the reason for the imminent fall of the Byzantine Empire was the Orthodox theology. He sought not only the formation of a political model but also the creation of a new philosophical-theological system that expanded in many fields of knowledge like Plato's *Republic* and *Laws*. For that purpose, he reintroduced the theological foundation of

ancient Greece, i.e., the worship of the ancient Greek gods adding elements from Neoplatonism and Zoroastrianism. This was the key point that led to the controversy between Byzantine scholars and specifically triggered Scholarios' polemic. Scholarios confuted and tried to disprove Pletho's interpretations of Plato's and Aristotle's views in his treatise *Contra Plethonem* (Κατὰ τῶν Πλήθωνος ἀποριῶν ἐπ' Ἀριστοτέλει). He focused on particular works of Aristotle deliberately to respond to Pletho's attack on Aristotle and to defend his political attitude toward the union. Pletho responded with his essay *Contra Scholarii* (Πρὸς τὰς ὑπὲρ Ἀριστοτέλους Γεωργίου τοῦ Σχολαρίου Ἀντιλήψεις). Scholarios avoided writing a reply or taking political action against Pletho's writings, although he suspected Pletho's paganism when Pletho was alive. He only was certain when the *Book of Laws* came into his hands, which he burned publicly. Scholarios was really aiming to defend the Christian Orthodox identity from all threats. In the Byzantine world, the victory of the Aristotelians was total, given that Scholarios became the Patriarch of Constantinople. This demonstrated the wider theological–philosophical problem of the fifteenth century which was personalized to Scholarios and Pletho. The controversy between the two men led to the beginning of a trend among thinkers juxtaposing Plato and Aristotle.

Scholarios as a Writer

Scholarios' work is vast and pertains to many subjects. So apart from his theological and philosophical work, Scholarios wrote grammatical, rhetorical, liturgical, and apologetical works, as well as religious poetry. He translated and commented on many Greek and Latin works, and he wrote a plethora of letters. His work covers eight volumes which were published in Paris by Louis Petit, Xenophon Siderides, and Martin Jugie between the years 1928 and 1936. It is a valuable project that reveals most of Scholarios' work, but it is said that it is lagging at literary and critical scrutiny.

Several later scholars praised Scholarios for his critical ability and the power of his argumentation. In every period of his life, he expressed

himself through writing. He defended theological positions, as well as philosophical ones without hesitation for the sake of true knowledge.

His teachings about the holy days of Orthodoxy, such as the Transfiguration of Jesus, the Friday of Sorrows, the celebration of the Holy Apostles, the three speeches dedicated to the Marian feast days (which he writes about during various periods of his life), his contra-Latin and contra-Jewish works, as well as his attitude against Barlaam of Calabria (1290–1348) and his Pastoral and Ascetic work, define him as a theologian.

His interests extend to other central theological topics, such as God's Providence, Divine Destination, immortal souls, and the way of their existence. Scholarios approaches these topics by quoting Greek Orthodox Fathers, such as Gregory of Nyssa, Maximus the Confessor, and many others. He also refers to the teachings of Plato, Plotinus, Origen, Augustine, Scotus, and others which may be thought of as controversial concerning his adherence to the Orthodox positions.

Scholarios' attitude toward complex philosophical and theological disputes, his commenting ability, as well as his capacity to negotiate dogmatic issues are indicative of his philosophical and theological abilities. An example of his critical ability lies in his claim that he made corrections to the translated Latin text of Thomas *De ente et essentia* to highlight its true meaning when he was appointed to the palace.

In addition to his few pastoral and ascetical writings, there are some treatises, like *Απολογία περὶ τῆς σιωπῆς· πρὸς τὸν αὐτὸν*, which give valuable insight about the state of Constantinople at that time and the reasons for Scholarios' resignation from the Patriarchal throne. Furthermore, we find some original literary writing in the form of odes, and treatises about the subject of ethics, such as *Various Thoughts* (Κεφάλαια πάντων ὠφέλιμα) and *The difference between venial and deadly sins* (Περὶ διαφορᾶς τῶν συγγνωστών καὶ θανάσιμων ἁμαρτημάτων σύντομον καὶ σαφές and *Τοῦ αὐτοῦ ἀναγκαῖα ζητήματα*). His correspondence gives a lot of information about his perceptions on many theological and philosophical matters.

Ecclesiastical and Philosophical Tradition (Palamism, Thomism, Aristotelianism)

The controversy about Scholarios' intensions begins from the fact that at the same time he supported Palamism and admired enthusiastically Thomas. The opposition to Palamism was associated with Latin scholasticism and especially with the scholasticism of Thomas, because many byzantine scholars drew their arguments from him. Scholarios is thought to be one of them but by being adherent to the Orthodox positions, especially on the matters separating the Churches. The conflicting views about Gennadios' stance toward Palamism initiated from the connection of Scotus' *distinction formalis a parte rei* with the Scholarian approach of the essence–energies distinction, which was considered as an attempt to temper Palamite theology. Modern scholars more and more contradict this view.

In the debate about the supremacy of Plato over Aristotle, Scholarios favored Aristotle, opposing his contemporaries Bessarion and Gemistos Pletho. Scholarios' desire to strengthen Christian dogma came along with the previous practice, as well as with the common practice that was used mostly to reconcile Aristotle's philosophy with Christian theology.

Scholarios as a Philosopher and Commentator

The theological debate on the definition of life took place in the Orthodox East by Scholarios, Mark of Ephesus, Theophanis of Medeia, and George Amiroutzes. This debate is not particularly known, but it is worth mentioning because it provides information about Scholarios. Mark of Ephesus connected life with prediction and predestination. This view correlated both with the views of Neilos Kabasilas and Augustine's theory of absolute predestination. Scholarios composed five treatises regarding the subject (the first was written in 1459). His approach is radical and shows his genuine theological and philosophical interest. Scholarios relied mainly on the orthodox position of God's wisdom. He also opposed the concept of *heimarmene* and gave further clarifications about the concept of the in-time existence of human freedom. Furthermore, in a letter written to his friend and defender Theofanes of Medeia, he

examines the concept of the soul. He refutes Plato's position of pre-existence, as well as the Stoic perception of the blending of human soul with matter, which according to Scholarios makes it subject to destruction.

Scholarios' ability to interpret and assess specific philosophical perceptions led to be characterized as "the last great representative of Byzantine erudition." His multiple references to philosophical concepts, as well as his comments on the works of Aristotle, prove his special interest in philosophy. He considers Aristotle the greatest philosopher who as to Scholarios conviction is compatible with Christian doctrine. The entire seventh volume of his *Œuvres Complètes (OC)* relates to the examination of Aristotle's thinking. He starts from Aristotelian logic, commenting upon Porphyrys' *Isagoge (Prolégomènes proprement dits l' Isagoge de Porphyre, 7–113)* and then *Categories, De Interpretatione, Physica, De caelo, De anima, Parva naturalia, Meteorologica*. Finally, he elaborates on various notions of Aristotle's philosophy, such as *deprivation* (στέρησις, *sterisis*), *ultimate end* (τέλος, *telos*), the categories of *having* (ἔχειν, *echein*) and *place* (ποῦ, *pou*), *dimension* (ἐκ τινός, *ek tinos*), *perfection* (τέλειον, *teleion*), *completion* (πέρας, *peras*), *disposition* (διάθεσις, *diathesis*), *hexis* (ἕξις), *passion* (πάθος, *pathos*), etc. At the introduction of the volume, Scholarios writes to Constantine Palaiologos. In this letter, he notes that for the purpose of commenting, he has in front of him the *Posterior Analytics* and also the Greek and Latin commentaries. Scholarios makes the distinction between the Greek and the Scholastic exegetical tradition. He also distinguishes between the old and new Latin commentaries. He acknowledges that the Latins took the previous comments into consideration and supplemented them.

There have been some objections as to the novelty of Scholarios' comments. This matter begins from the fact that he uses a sufficient number of comments from previous commentators. He attests that for the fourth part of his work, he uses Aquinas' commentary. This serves the purpose to praise Thomas' interpretation, which needs no further editing. Scholarios states that Thomas

tired himself enough with his interpretation and by doing so he thought that it was unnecessary to tire himself out too. Scholarios mentions in his writings the references to other commentators (τοῦ Θωμᾶ τοῦτο). Thus, there are indications that when he is using others' comments, he does not claim that they are his own. Gennadios argues that he knows the Latin language very well and has access to many texts concerning Aristotle. Furthermore, he asserts that he does not cite the comments of previous commentators without a critical eye. Scholarios attacks these views of the previous commentators in courteous terms by pointing out his objections. He aims neither to brag nor challenge, but for "his love for true philosophical explanations." On the contrary, he adopts what he considers good philosophical interpretations and respectively rejects those that do not promote philosophical knowledge.

Scholarios regards himself as one of the leading Byzantine philosophical thinkers, such as Leon Magentinos (thirteenth century), Michael Psellos (1017/1018–1078), and John Philoponus (490–570). He is also described by later scholars as the "Psellos of the Fall." In the introduction of the seventh volume, he also mentions that he founded a school of philosophy, but he had only a few capable students.

Thomism

Scholarios is known for being a fervent Thomist. But the coexistence of Thomistic and anti-Thomistic elements in Scholarios' works made some researchers refer separately to him when studying the case of Thomism in Byzantium. Scholarios has high esteem for Thomas and he appeals frequently to his authority. For this, he was accused of being a "Latinophile" and he wrote a long *apologia* to overturn the charge. He considers Thomas to be an excellent interpreter of various areas of thought. His comments and translations may not have intended to stand on the breach between Romans and Latins, but he acknowledges that Thomas is an expert user of classical philosophy. Scholarios as previously said encountered Thomas' commentaries on Aristotle. He also eagerly delved into Thomas' major works *Summae contra Gentiles* and *Summae*

Theologiae. His interpretation and comments take place in volumes V and VI of his *OC*. He also translated *De ente et essentia* for his student Matthew Kamariotes. In his letter to him, he accentuates the mentality and the method of the book which he considers to be excellent – minus some few parts where the doctrines differ.

Scholarios' study of Thomas led to the elaboration, partial translation, and commentary of the Latin text. Scholarios had at his disposal almost all the works of Aquinas. He claims that he had some translations of them and that he also translated some other parts in the Greek language. Probably, when Scholarios speaks about the previous Greek translations, he refers to the work of Demetrios Kydones (c. 1324/5–1397/8), an important Byzantine scholar who continued the work of Maximos Planoudes by translating Aquinas' major works.

Scholarios' convergence with Thomas, especially concerning *Summa Contra Gentiles*, is not superficial. It was a pertinence that designated the request for a provisory alliance and indicated the philosophical relations which manifest through Pletho's philosophy or through the presence of the Islamic element. Scholarios, as the main exponent of Orthodox theology, felt he had the duty to defend the orthodox gentiles, like the Balkans or other regions and tribes within the limits of the Byzantine Empire. The Ecumenical Patriarchate of Constantinople was the major Patriarchate of the East and should have retained its ecumenical character and its theological influence over the gentiles as well.

Scholarios was also stimulated by Thomas' practical approach to philosophical and theological matters. This conclusion is valid since they both employed the method of scholasticism in articulating and defending their dogma. The common interest that Thomas and Gennadios share for Aristotelian philosophy and the fact that Aquinas refers to many Patristic sources of the Orthodox Church and cites from the Scriptures are the chief reasons why Scholarios chose to study his teachings. But Thomas' sources influenced indirectly Scholarios. Latin translations of Arabic and Jewish annotations of Aristotle, particularly those of Averroes and Avicenna, have particularly influenced Aquinas, despite the incorporation of

Neoplatonic elements into their own thinking. What is new and unexpected is the reception of these ideas by a Western thinker. This reception is particularly important, mainly for the understanding of the dissemination of philosophical ideas in the Late Byzantine and Post Byzantine periods.

Apart from his proclaimed appreciation of Thomas, Scholarios approaches Thomas' viewpoints certainly not uncritically. Moreover, Scholarios points out the differences between the Catholic and Orthodox Church wherever they emerge or in other cases, he stays away from dogmatic disagreements. In addition, this is not the case for all his work besides his dependence on western scholasticism in terms of content and structure. In many cases when Scholarios comments Thomas, he gives a slightly different argument to support an established position or a small addition to Thomas' answer. Therefore, he may use some viewpoints from the Latin texts and even adopt elements of other's teachings, but he does it in a critical manner, bearing always in mind his adhesion to the Orthodox positions. That is why Gennadios points out that Thomas supports the doctrines of the Catholic Church on the question of the emancipation of the Holy Spirit and on the distinction between divine essence and energies. Scholarios declares that he had remarked on these differences in the past and fought against them in many of his books, which are spread throughout the world.

Scholarios in the introduction to the fifth volume of *OC* attests the reasons for attempting the arduous task of epitomizing Thomas. He claims that the main reason was his love for the books. Their massive size makes them hard to interpret, understand, and transport – albeit the size of the chapters and the accuracy of their arguments. Scholarios states that his life was full of unintentional transitions. So, he came up with the idea of this epitome “out of necessity and with no other ambition,” as he notes, because he could not carry these books everywhere with him.

Scholarios also refers to the race, or else, *genos* (γένος) of the author of the books. It is important to note that he points the obvious, i.e., Thomas is Latin by *genos*, and that explains how someone perceives the beliefs of their church as ancestral

(Ὁ δὲ τῶν βιβλίων συγγραφεὺς Λατῖνος μὲν ἦν τῷ γένει· διὸ καὶ τῇ δόξῃ τῆς ἐκκλησίας ἐκείνης ὡς πατρίῳ κατείληπτο· τοῦτο δὲ τὸ ἀνθρώπειον ἔθος· [...]). From this point of view, Scholarios praises the writers' wisdom and recognizes the value of Thomas, as an exegete of the Old and New Testament, Greek and Latin Fathers, in addition to his innovative thought. For Scholarios, Aquinas is a wise man, worthy of study, an excellent interpreter and expositor of Christian theology.

Impact and Legacy

Scholarios' polemic against Pletho was continued by his student Matthew Kamariotes and by Matthew's student, Manuel of Corinth (c.1460–c.1551), although Gennadios' disciples did not evince any profound admiration about Thomas or other scholars of Latin Theology. But some other cases are found, in which familiarity with the Latin Patristic tradition is shown, as well as a close knowledge of Latin scholasticism (Joseph of Methone, Gabriel Severos, Maximos Margounios, Meletios Pegas, etc.). Concerning the influence of Scholarios' epitomes and translations, it is important to mention that only a few manuscripts were distributed in the close circle of his students. Scholarios in his writings complains about the low educational level and the lack of interest in learning of the Byzantines. This perception is followed by his deep concern for the intellectual progress and survival of his *genos*.

The whole controversy of Scholarios and Pletho over the primacy of Plato and Aristotle resulted in a revival of philosophical discussion among the Greek intellectuals of the final phase of Byzantine thought. Matthew Kamariotes, Theodore Gazes (c.1400–c.1475), Michael Apostoles (1420/1422–1474/1486), Andronikos Kallistos (1400–1476), George Trapezountios (1935–1472/1473), and Bessarion are some of these Byzantine scholars that took part in this philosophical debate. This led to the flourishing of new writings concerning philosophical topics, such as the problem of universals and to the readings of ancient commentators, which opened the

discussion about the Byzantine philosophical tradition.

Concerning the impact and legacy of Scholarios, the later scholars seem even more so interested in his work. A thorough study about the impact of fifteenth-century Byzantine theology and philosophy outside the limits of the Ottoman Empire is a desideratum. This research would enlighten us with respect to the impact of his ideas. It is thought that the legacy of Post Byzantine theology and philosophy in general, written in Greek language, resides especially in the theological developments of the West, as well as in the Russian Orthodox Church which is one of the autonomous Eastern Orthodox churches which was in full communion with the Patriarchate of Constantinople.

At subsequent times, within the Ottoman territory, Scholarios influenced and contributed to the formation of two literary movements. These movements evolved beside the expected lack of interest in theological discourse that followed the Ottoman conquest. The first movement emerged from the literary tendency toward the reconciliation of Orthodox Christianity with Islam. The second movement was the Messianic utopian trend which concerned the salvation of the *genos* that later evolved into the formation of the *Great Idea*. These movements were not mutually exclusive in their timeframes and occurred somewhere between the fifteenth and nineteenth century. About the first trend, there are three works written by Scholarios which confirm the dialogue with Islam. Two of them are addressed to Muhammad II and the third to some Ottoman officials that were in Feres. The second trend relates to the Christian apocalyptic discourse and extends to eschatological themes. It also reaches across a wide range of literary subjects, some of them already used by Scholarios, such as hymns, oracles, interpretations in Christian eschatology (primarily of the Book of Revelation), chronographs, and folksinging. Scholarios is the leading figure in these movements.

It is also worthwhile to note that Scholarios, like many of his contemporaries, takes a careful look at the matter of the elements that contribute to the formation of the Hellenic identity. To the

question “Who am I?” Scholarios responds that he considers himself a Christian. Scholarios’ definition of identity does not come as a result of birthplace and language, but as a combination of his tradition and beliefs. Despite the commonly held view, Scholarios also thinks of himself as Hellene and Roman. He always bears in mind the possible ruination of his genus (τοῦ γένους ὀλέθρῳ). He only rejects the idea of a Hellenism that imitates classical antiquity and does not correspond to his time.

School of Salamanca

Andreas Wagner and Anselm Spindler
University of Frankfurt, Frankfurt am Main,
Germany

Abstract

The term “School of Salamanca” is used to refer to a group of Spanish theologians and jurists from the sixteenth to the seventeenth century, ranging roughly from Francisco de Vitoria (1483–1546) to Francisco Suárez (1548–1617). There is a rather broad agreement that the works of this group of authors are, in one way or another, of great importance in the process of the emergence of modern practical philosophy. But there is little agreement with regard to both the content of the concept of the School of Salamanca and its exact extension. In this entry, we would like to offer an account of the controversies that surround this concept: We will first identify three central aspects of the historical context in which the School of Salamanca is usually situated and offer a preliminary profile of the

School. We will then describe how, i.e., by what features and in what fields, the works of these authors are thought to be relevant for an adequate understanding of the emergence of modern practical philosophy. Finally, we will try to sort the different strands of reception of the School and the different strategies of defining it and of assessing its impact and enduring relevance according to stakes that are often implicit in scholarly literature on the School of Salamanca. Our goal is to show how the very identification of the School is a matter of locating the decisive points of rupture and heritage on the part of today’s scholarship.

Introduction

General histories of practical philosophy often include a chapter on Francisco Suárez’ (1548–1617) account of natural law, which they take to be of some importance in the process of the emergence of modern practical philosophy (see, e.g., Schneewind 2003; Irwine 2008). However, more specialized scholarship on early modern practical philosophy has long come to acknowledge that Suárez is part of a larger group of Iberian authors from the sixteenth to seventeenth century, a group that, since the late nineteenth century – first, it seems, in writings in the history of economics and the history of international law –, is often referred to as the School of Salamanca (see Alves and Moreira 2013). More specifically, the term “School of Salamanca” is used to emphasize the impact of certain innovative and original ideas in practical philosophy during that time that cannot be explained with reference to the role and reception of single texts or even single authors alone. While there are also other terms used in the literature to refer to the same or a similar group of authors, e.g., “Second Scholasticism” or “Iberian Humanism,” there is a rather broad agreement that the works of this group of authors are, in one way or another, of great importance in the process of the emergence of modern practical philosophy. There is also quite a bit of research focusing on the theoretical philosophy of authors that are seen as belonging to the School of Salamanca, especially

on Francisco Suárez (see, e.g., Doyle 2011, Sgarbi 2010, Honnefelder 2013, and the respective contributions in Hill and Lagerlund 2012 and Schwartz 2013). But as far as we know, the term “School of Salamanca” is not used as frequently and as deliberately as it is used in the literature concerning the practical philosophy of the respective authors. Therefore, we will assume in what follows that the concept of the School of Salamanca is a concept that is central only to the history of *practical* philosophy.

Despite the widely shared idea of the importance of the School of Salamanca in the history of early modern practical philosophy, however, there is little agreement with regard to both the content of the concept of the School of Salamanca and its exact extension. Various attempts have been made at characterizing or “defining” the School of Salamanca, but even the kinds of criteria that such attempts should rely on are contested: Should the School of Salamanca be characterized according to certain geographical, institutional, or social settings? Or should it be characterized according to its particular intellectual heritage from the Middle Ages or according to certain of its discursive effects (intended or not)? Or should it be characterized according to specific substantial philosophical or methodological ideas? As a consequence, the exact extension of the group is controversial as well: For a long time, many scholars took the School of Salamanca to be a group of authors ranging roughly from Francisco de Vitoria (1483–1546) to Francisco Suárez (1548–1617) (see, e.g., Hamilton 1963; Brett 1997; Böckenförde 2002; Pagden 2011). In the meantime, however, a variety of more fine-grained views has been developed. They include the idea of a subdivision of the School of Salamanca into several interconnected generations of authors. They also include very narrow conceptions that limit the School of Salamanca to the holders of the theological *Prima* and *Visperas* chairs at the University of Salamanca (these ideas are not mutually exclusive; see, e.g., Belda Plans 2000 for a model of the school comprising several generations of holders of these chairs). And they include very broad conceptions that take the School of Salamanca to incorporate

non-theological authors, or authors writing even before Vitoria (see, e.g., Flórez Miguel et al. 2012) or after Suárez, and authors living and writing far beyond the city limits of Salamanca (see, e.g., Pena González 2009).

Given the rather perplexing state of scholarship, we will proceed as follows: Starting from the historical context in which the School of Salamanca is normally situated and from a preliminary profile of the school (II), we will describe how, i.e., by what features and in what fields, the works of these authors are thought to be relevant for an adequate understanding of the emergence of modern practical philosophy (III). In the final part of the entry, we will then try to sort the different strands of reception of the School and the different strategies of defining it and of assessing its impact and enduring relevance according to stakes that are often implicit in scholarly literature on the School of Salamanca, thereby showing how the very identification of the School is a matter of locating the decisive points of rupture and heritage on the part of today’s scholarship (IV).

Heritage and Rupture with the Tradition: The School of Salamanca in Twentieth-Century History of Practical Philosophy

The historic background against which the works of the authors of the School of Salamanca are usually situated is shaped by three major factors:

The first is the “discovery” of the “New World” and the beginnings of the Spanish colonial empire (see, e.g., Brufau Prats 1988; Brett 1997; Pereña 1998; Böckenförde 2002; Anghie 2007; Pagden 2012). On the one hand, this propelled the growing of Spain’s international importance as well as its own internal structural reformation: With a stream of resources imported from the colonies, and faced with necessities of administering the remote territories, Spain found its way to modernize the State in a creative way. New offices, such as viceroys and councils, and new fields of governmental activity and regulation (such as the trade with the colonies, which got its own “ministry,” the “Casa de Contratación”) were established and helped to consolidate central

power and to give it presence and effectiveness in all parts of the kingdom. On the other hand, the question of the nature and due treatment of the newly “discovered” peoples turned out to be of major importance: in 1537, Pope Paul III had declared in his papal bull “*Sublimis Deus*” that the indigenous population of the conquered territories should be considered human beings capable and worthy of salvation and, by extension, regular subjects of the king equal to their metropolitan co-citizens. The “equality effect” of this declaration, however, was negligible. Instead, it defined America as a stage for missionary initiatives and provided a justification for all kinds of incursions and oppressions based on the pagan culture of the indigenous peoples. Economic interests of the colonizers and their sense of religious and cultural (if not natural) superiority firmly established brutal regimes of slave labor, often against both explicit promises by local authorities and royal or papal policy decrees. However, beginning with Antonio de Montesinos’ Easter sermon of 1511, there also was a prominent and vocal public criticism of this ruthless behavior and of the oppression of the indigenous population. Official and unofficial reports reached the Court and the confessionals, so that the need to criticize and correct the developments in the colonies was felt in many places. The *Leyes de Burgos* from 1512 were a first official reaction, meant to provide a legal framework and procedures for the establishment and the organization of colonial communities, presumably not least in order to provide some measure of safety for the indigenous population. However, as, e.g., Bartolomé de Las Casas among others reported, the use of those laws by the *encomenderos* hardly bettered the situation.

The second factor that is often thought to determine the historic background of the writings of the School of Salamanca is the protestant reformation and the vision of moral and political life it entailed (see, e.g., Skinner 1978; Brett 1997, 2010; Schnepf 2007; Recknagel 2010; Scattola 2012). On the one hand, the protestant discourse is often seen as figuring as one of the major opponents in the writings of the catholic, “counter-reformation” authors of the School of Salamanca. For the protestant writers not only launched a critical attack

on ecclesiastic authority but also emphasized the sinful character of human nature and the necessity of the undeservable and imprevisible gift of divine grace, which was also taken to imply a conception of political power according to which governmental authority was necessary to compensate for the lack of morality but was itself isolated from moral considerations stronger than those of functional rationality. And while the Florentine author Machiavelli was not exactly a protestant, he laid the foundation for a theory that would, not least in protestant intellectual and academic contexts, be elaborated to a discourse of reason of state, decoupling political imperatives from morality. Against this background, the authors of the School of Salamanca are often portrayed as having “pelagian” convictions according to which human nature was not lost through original sin but is a firm, “secular” basis for morality. Also, they are attributed with a more substantial or even moralized concept of politics that contrasts with the conception of reason of state. On the other hand, however, there is also scholarship that shows how permeable the borderline between the catholic and the protestant discourse of this period was and how this allowed also for a great deal of positive influence of catholic authors on protestant authors, and vice versa, even if the authors themselves, for obvious reasons, may not explicitly acknowledge their indebtedness to writings that were associated with the opposite camp.

The third factor that is frequently taken to determine the historic background of the writings of the School of Salamanca is the particular tradition of Iberian (“scholastic”) Humanism (see, e.g., Noreña 1975; Skinner 1978; Fernández-Santamaria 1977, 2005/2006; Gil 2002; Espinosa 2008; Fuertes Herreros 2011, 2012; Pena Gonzalez 2010; Valenzuela-Vermehren 2013; Boone 2014). Various universities in France and Italy, most notably the University of Paris, had been places of formation for a considerable number of Spanish scholars who came to occupy chairs in theological, artistic, juristic, and other faculties in the fifteenth and early sixteenth centuries at universities on the Iberian Peninsula. They brought with them the latest developments

in natural philosophy and the beginnings of modern natural sciences, a more or less eclectic approach to methodology and to the traditional “three ways” of theology, a sensitivity for the importance of language and of textual sources, and a focus on the human and the daily life as the origin of questions addressed to science and scholarship. One of the major points of this development consisted in a turn to Aristotelianism and an interest in Thomas Aquinas’s Aristotelian *Summa Theologiae* in various domains of academic scholasticism. As we have seen, the political realm was in a particular need of new answers and approaches. And in Spain, unlike, e.g., in Italy, the extra-universitarian humanistic circles had never replaced academic scholarship in terms of political counselling. While practitioners have contributed important works and motives of political theory, this genre was anything but foreclosed from academic theologians, philosophers and jurists. In fact, in the fifteenth century, a group of theologians established an Aristotelian discourse on practical and political matters at the very university of Salamanca; they are often called the “First School of Salamanca.”

Even before Vitoria then, theological, philosophical, and juridical authors from the University of Salamanca have been conjointly involved in academic and political responses to all three of these factors. But scholars tend to agree that it was Francisco de Vitoria’s accession to the *Prima* chair of theology in 1526 that inaugurated the actual *School of Salamanca*. Vitoria was a charismatic orator and teacher – in fact, it was the students of Salamanca who elected him to occupy this chair – and the impact he made was founded mainly on his *relectiones*, i.e., university lectures that were open to all faculties and transcriptions of which have only posthumously been published in print in 1557. However, most contemporary authors agree that while the acknowledgment of an intellectual debt to Vitoria was a salient feature of the many members of the School of Salamanca, the latter would not have been established, were it not for Domingo de Soto and Melchor Cano, two immediate colleagues and self-styled disciples of Vitoria. (For different roles in the context of the constitution of a school, such as founder, leader,

disciple, etc., see, among others, Tiryakian 1981.) Soto has been characterized as a prolific author who invented a whole new academic literary genre for the concerns of the School of Salamanca, namely, the treatise *De Iustitia et Iure*, based on the respective but not directly consecutive parts *De lege* and *De iustitia* of Aquinas’s *Summa Theologiae* (see Scattola 2009). Cano, on the other hand, established an epistemological and methodological frame of reference that should be of lasting importance in theology (see Pena Gonzalez 2005, 2010) (more on those below). Together with these, a small number of other authors are commonly taken as the core or first generation of the School of Salamanca. There is some debate, however, over whether or not scholars from disciplines other than theology can be counted to that core: For reasons of conceptual precision, authors like Belda Plans (2000) suggest to restrict the concept only to holders of specific chairs in the faculty of theology at the University of Salamanca (e.g., Vitoria, Soto, Cano), whereas others, like Pena Gonzalez (2009, 2010), include jurists and professors of philosophy, reflecting relationships that are documented in academic works and letters. And while there is debate on how to distinguish subsequent “generations” of the School from mere influence and reception (“proyección”), it is clear that a vast number of authors – in Salamanca and elsewhere and in theology as well as in other disciplines – saw themselves as explicit heirs to Vitoria and the first generation and that the influence of the School was even greater, setting standards and arguments acknowledged even in protestant circles and in debates taking place centuries later.

Innovative and Original Aspects: Detailed Descriptions of Creatures and Fields

Against this commonly assumed historical background of the School of Salamanca, provided by the discovery of the “New World,” the protestant reformation, and the development of “Iberian Humanism,” diverse aspects have been put forward as articulating salient features of the School

of Salamanca, explaining both the group's coherence and its impact and relevance in the emergence of modern practical philosophy.

One obvious moment mentioned throughout the literature is the concentration on Thomas Aquinas's *Summa Theologiae* and more specifically on its second part (see, e.g., Scattola 2010). The *Summa* was felt to provide a methodology better suited to dealing with contemporary issues in the discussion. Vitoria and Soto managed to get the formal theological curriculum at the University of Salamanca changed so that, instead of Lombard's *Sentences*, the *Summa* became the most important reference text. This was an initiative they brought with them from the University of Paris. The result was a curriculum with some contortions: Officially, the major text to be read was still the *Sentences*, but they were read "according to" the *Summa Theologiae*. Whereas the *Prima* and the *Visperas* chairs of theology were practically free to adopt any conceptual framework and to focus on what they perceived as important issues, Vitoria and Soto stuck closely to Thomas Aquinas. Over several decades, they lectured extensively on the *Secunda Secundae*.

However, a turn to practical issues in the School of Salamanca was not only an institutional matter of focusing one's lectures on certain parts of the *Summa* rather than other. According to many commentators, this "practical turn" became a centerpiece of the methodological orientation of many of the authors that have come to be included in the School of Salamanca. As a consequence, many commentators have suggested to make this "practical turn" itself a salient characteristic of the School of Salamanca (see, e.g., Brufau Prats 1988; Belda Plans 2000; Böckenförde 2002). While drawing on traditional methods of argumentation found in medieval scholasticism, especially in Thomas Aquinas, its members turn their attention to the social, economic, and political realities of the world they live in. And they do so not just with an academic interest in making the world the touchstone of the theories they inherited from the Middle Ages but also with an explicit interest in changing the world by their philosophically informed contributions to a public discourse. Besides their regular teaching activities,

the so-called *relectiones* proved to be an important aspect of their mission: At the end of the academic year, they held lectures that applied the concepts and arguments of their teaching to current, mainly political, problems – examples include the licitness of forced baptism of the indigenous population in the colonies, the divorce of Henry VIII, and just war. Students from all faculties attended these lectures and helped the School's theses to spread quickly.

Thus, on this reading, Francisco de Vitoria's *Relectiones*, being the public-spirited interventions on current political issues that they were, turned out to be something like foundational documents of the School of Salamanca that echo even in large treatises such as Luis de Molina's *De Iustitia et Iure*, which, despite its massive theoretical framework, remains closely in touch with the current situation of the Spanish empire. As has been mentioned, the issues the Salmantine authors concerned themselves with were the chief political and social questions of their times: Reflecting their humanist approach, the actual life of human beings as such – independently of rank and religious affiliation, but not isolated from their respective community or even from contact with other communities – was perceived to pose important problems. And for pragmatic reasons, the resolution of those problems had to be conceivable in the terms of human reason alone, independently of the authority of theological tradition (which was highly disputed – in protestant contexts – or even unheard of and unconvincing, in the American context). This argument is possible because, according to the Thomists, divine grace did not supersede, suspend, or eliminate (human) nature, but perfected it. Human nature was not thoroughly corrupted by the original sin. Hence, the core of valid solutions to practical problems in terms of capabilities and in terms of what counts as a solution in the first place could be found and elaborated independently of divine revelation. Also, Vitoria and his followers found human reason to be an intersubjective capacity, susceptible to improvement by expertise and exchange, accumulating with time and tradition. From this, there resulted an attitude of assessing and eventually acknowledging the legitimacy of practical and

social rationality independently of its theological justification. In this sense, a recurrent argument of the Salmantine authors goes, such a reliance on human capacities not only does not contradict but even confirms and lends credibility to Christian doctrine – organizing the social world and solving practical problems relying on a human reason available to every human being is well-suited to the pluralistic world in which the problems arise and at the same time promotes Christian values and furthers understanding of the Christian religion.

With regard to the language, in which such problems are dealt with, the debates in the School of Salamanca are usually seen as organized around the central concepts of (natural) law and justice. The pertinent questions are those of legality, admissibility, obligatoriness, etc. Commentators often interpret this focus as a turn away from many of the virtue-ethical or aretaic concepts inherited from the Middle Ages and toward a sort of “juridification” of morality (Wagner 2011; Birr 2013; Decock and Birr 2016; for a critique of this view with regard to Suárez, see Schaffner 2016). This turn is reflected in the conceptual scheme of the treatises *De iustitia et iure*, which are obviously inspired by commentaries on *Summa Theologiae* I–II, q. 90–108 (*De lege*) and *Summa Theologiae* II–II, q. 57–122 (*De iustitia*), but which, in contrast to continuous commentaries, leave out many other parts of the *Summa*, e.g., Aquinas’s treatment of happiness. It is not that these virtue-ethical concepts have no role whatsoever in the works of authors of the School of Salamanca; but the conceptual framework of their practical philosophy is based on juridical concepts such as justice, right, or law.

Giving a more precise shape to this “legalistic” approach, yet other scholars submit that it is a more or less specific doctrine of subjective and/or natural rights that characterizes the authors of the School of Salamanca (see, e.g., Brufau Prats 1988; Kaufmann and Schnepf 2007; Brett 1997, 2010). Drawing on the late medieval poverty controversy, which provided complex insights into both the will as the faculty of free choice and the concept of *dominium* as an individual entitlement

of a person, the authors of the School of Salamanca attempt to integrate the idea of individual rights or even of individual natural rights into the traditional framework of Thomist natural law theory. Thus, their work represents a shift in perspective, away from the idea of an objective order of society and toward the idea of society and its development as resulting from the free behavior of autonomous individuals who are the bearers of rights that structure the normative relations between them but do not prescribe a concrete manifestation of social order and individual action.

A significant strand of literature on the School of Salamanca discerns substantial commitments of its authors in terms of the very foundations of morality and natural legal obligation: In this debate, it is often assumed that the authors of the School of Salamanca are united in their rejection of a positivist or radically voluntarist understanding of natural law as an arbitrary command of God (a view which they associate with Ockham) and their rejection of the idea that morality does not have a natural basis, i.e., that human beings depend on their moral orientation and in their moral action on divine revelation and divine grace (a view which they associate with protestant moral theology). Against this background, commentators then draw on the idea of two generations of the School of Salamanca to characterize the moral thought of the respective authors: While the first generation, most prominently Francisco de Vitoria and Domingo de Soto, advocates a sort of ethical naturalism inherited from Aquinas and centering around the concepts of the ultimate end (*finis ultimus*) of human action and the natural inclinations (*inclinationes naturales*) of human beings (see, e.g., Deckers 1991; Doyle 1997), the second generation, notably Francisco Suárez, argues for a moderate form of divine command theory centering around the concepts of obligation (*obligatio*) and will (*voluntas*) (see, e.g., Böckenförde 2002; Stiening 2013). This view of natural law is often seen as avoiding the pitfalls both of Thomist naturalism (which is taken to be in danger of extending morality far beyond the realm of human action and of losing sight of the specific character of *moral* obligations) and of

Ockhamist voluntarism (which is understood as being unable to account for the non-arbitrary character of moral rules). As such, it is taken to have had a lasting influence in the modern discussion about morality and obligation that can be traced to the works of later authors such as Hugo Grotius (Darwall 2012) and Immanuel Kant (see Ludwig 1997; Pink 2012).

More recently, however, this picture of discussions of moral philosophy in the School of Salamanca has been challenged by two novel perspectives. On the one hand, there is scholarship suggesting that there might be a third view that can be found in the writings of authors of the School of Salamanca, namely, the view that morality has its roots neither in natural inclinations nor in divine commands, but rather in practical reason. Natural law, on this reading, is the law of (human and nonhuman) practical reason. Interpretations of this proto-Kantian variety have been developed, for instance, for the takes on natural law offered by Francisco de Vitoria (see Spindler 2015) and Gabriel Vázquez (see Mandrella 2016). On the other hand, there is the view that the literature on moral philosophy in the School of Salamanca has for a long time mistakenly overemphasized the relevance of foundational questions of natural law. For this, as commentators like Schüßler (2003, 2006) have argued, it may not be the field where innovation took place in the moral philosophy of the School of Salamanca. According to this view, the respective authors are not primarily interested in questions concerning the foundations of morality in the abstract but rather in the practical application of moral principles under conditions of risk or uncertainty. Hence, the important contribution that can be found in their texts is a relatively advanced theory (or at least elements of such a theory) of rational decision-making in the realm of morality which prepared the subsequent development of early modern “probabilism.”

In a similar vein, one of the most influential strands of the reception of the School of Salamanca finds the practical application of natural law considerations in concrete geopolitical contexts to be the most distinguishing feature of the School of Salamanca. In this view, it is the newly

acquired global perspective that prompts a distinctive form of secularization in the practical philosophy of the authors of the School of Salamanca (see, e.g., Kaufmann and Schnepf 2007) and establishes a distinct discourse of international law and international relations (see, e.g., Pereña 1998; Anghie 2007; Koskenniemi 2011; Pagden 2011, 2012; Thumfart 2012).

Heritage or Rupture? The School of Salamanca in Twentieth-Century History of Philosophy

In this final section, we would like to explore how these different strategies of characterizing the School of Salamanca and of assessing its role in the history of practical philosophy may be sorted according to the (often implicit) stakes in today’s scholarly literature on the subject. We will argue that this shows how the evaluation, and perhaps the very identification of the School itself, is a matter of locating the decisive points of rupture and heritage between the Middle Ages and modernity on the part of today’s scholarship.

One rather general aspect of today’s scholarship on the School of Salamanca seems to be the tendency to associate the question of how the School of Salamanca is best characterized with the question of how it fits into a narrative in the history of philosophy that explains the emergence of modern practical philosophy. While there is a variety of ways of presenting the school in such a narrative, we suggest to distinguish between two broad approaches and two evaluative attitudes: The first approach portrays the School of Salamanca as a last vestige of medieval practical philosophy, while the second identifies it as one of the first distinctly modern systems of political and practical philosophy. And the first evaluative attitude affirms modernity – whenever it originated – whereas the second is critical of it.

There are authors in today’s scholarship on the School of Salamanca who seem to assume, at least on a very abstract level, that the practical philosophy of the School of Salamanca is best characterized by its *continuity* with medieval thought. Merio Scattola, for instance, argues that practical

philosophy in the School of Salamanca is of interest to us precisely because it is modeled on a distinctly premodern and roughly Aristotelian understanding of what a theory of human practice can and should be – namely, a rather open and flexible body of knowledge that is adaptable and develops together with human practice itself. Thus, it contrasts sharply with modern attempts at a strict axiomatization of a “system” of moral thought that is modeled on the scientific ideal of mathematics (see Scattola 2017). Gideon Stiening, on the other hand, has argued that the authors of the School of Salamanca are something like the final representatives of a distinctly medieval approach to practical philosophy that has its roots firmly in traditional theistic theology and that it is not until authors like Immanuel Kant appear on the scene that the idea of a secularized conception of morality based on human autonomy emerges (see Stiening 2011). Thus, both approaches agree that the School of Salamanca unfolds its theory before the rupture inaugurating modernity; they disagree, however, on what constitutes this rupture and how it (and, along with it, classical modernity) should be evaluated.

The same is true of the idea that the School of Salamanca is best portrayed as itself constituting a point of *rupture* between the Middle Ages and modernity. This idea, too, may take different forms: Matthias Kaufmann and Robert Schnepf (2007), for instance, claim that the interesting new element in the practical philosophy of the School of Salamanca, setting it apart from classical medieval thought and connecting it to the modern discourse, is an explicit idea of subjective rights that distinctly shapes how these authors think about human practice (see Kaufmann and Schnepf 2007). In the same vein, Brufau Prats (1988) and others (e.g., García y García 1997) have suggested that in some way the modern concept of human rights originates in the moral thought of the School of Salamanca. Objections focusing on the non-individualistic aspect of the Salmantine doctrines have been countered by arguing that such motives are part of a collectivist understanding of human rights that are nonetheless subjective rights and that can even improve upon today’s human rights theory (da Silva Loureiro 2013).

On the other hand, however, commentators have argued from very different angles that it is precisely the modernity of the practical philosophy of the School of Salamanca that makes it an important part of, if not the origin of, a rather problematic development. For instance, Antony Anghie (2007) and John Williams (1990) have claimed that the School of Salamanca inaugurated an expansive or imperial phase of Western political hegemony: The alleged universality of the Salmantine’s cosmopolitanism then seems to be in fact a mere veil concealing particular interests and a versatile vehicle for an oppressive and exclusive domination of European, or Western, economic, political, and intellectual powers. An analogous criticism is voiced by more traditional scholars like Michel Villey (1973, 1987, 2006). They identify the School of Salamanca with a disastrous turn to liberal notions of individual subjective rights that has, alas, subsequently become all-pervasive in modern systems of law or, should we say, Western societies. (For this strand of the discussion, see also Brett 2015.) Thus, while all these different approaches agree on the identification of the School of Salamanca with the decisive break toward modernity, they disagree in their assessment of whether this rupture actually marks a step of progress. The evaluation of modernity itself by those authors seems to reflect in their reconstructions of the School of Salamanca.

There are, however, quite a few cases that further complicate the picture we have suggested. With regard to putting the School of Salamanca on one of the sides of the break between the Middle Ages and modernity (or of identifying it with the break itself), the arguments of such authors seem to reject the idea of a break itself: Maybe modernity is a consequent development or unfolding of medieval motifs. Then the School of Salamanca can either participate in this unfolding, or it can, as it were, stand apart. Wolfgang Kluxen, for instance, is one of a few medievalists who suspect that the practical philosophy of the School of Salamanca actually marks a kind of setback in the otherwise continuous and progressive history of practical philosophy. According to his view, there is quite a lot more congeniality between

Thomas Aquinas and a modern author like Immanuel Kant than between Aquinas and the self-styled Thomists from Salamanca who renounce many of Aquinas's insights that today appear quite modern (see Kluxen 2001). Spindler, on the other hand, suggests that much of the practical philosophy in the School of Salamanca can be interpreted as quite traditional, if we are ready to revise our common understanding of what medieval practical philosophy is: It is not just conceptions of ethical naturalism or divine command theories but also conceptions of autonomy that are part of the medieval heritage of the School of Salamanca, and these anticipate modern conceptions like Immanuel Kant's (see Spindler 2015).

The interpretations of this group of commentators (i.e., Kluxen, Spindler, etc.) taken as a whole actually suggest that maybe one cannot be so sure about what constitutes the fundamental core of modernity at all. The reception as a whole seems to indicate at least that modernity is a dialectical process, and if today's scholarship cannot agree on what the salient characteristic traits of modernity and what the directions of its developments are, how much more mysterious must this have been for open minds of the sixteenth century? The authors of the School of Salamanca have repeatedly shown to be quite conscious of "both sides" of the contemporary developments – of their emancipatory and universalizing advances but also of the oppression, exploitation, and discrimination going along with the universalization of European practices (Dussel 1993; Pagden 2003, 2011, 2012; Brett 2010; Koskenniemi 2011). On many points have the authors of the School of Salamanca indicated that they were aware of being witnesses or parties to fundamental transformations, and yet the essence of these transformations could not be transparent to them. In fact, it is questionable that this essence should have been fixed at all already at the time . . . if it is now, that is.

Abstract

“Scientia” is a long-standing heritage of Aristotelian logic and denotes an epistemic ideal pursued through several centuries. According to Aristotle’s (1984) *Posterior Analytics*, knowledge that conforms to this ideal must consist of propositions that are *universally and necessarily true*. This necessity can be *demonstrated* through *sylogistic inferences* that proceed from premises containing the *cause* of the conclusion. Accordingly, *scientia* consisted in a *systematic*, demonstrative presentation of why things behave the way they do, and not in the discovery of the causes from which demonstrations followed. This ideal started to erode in the Renaissance period. Its various aspects had been challenged and alternative ideals of inquiry had been proposed. As

the emphasis shifted from the demonstration of phenomena in accordance with Aristotelian logic and metaphysics to the production of useful knowledge and the standards of intelligibility changed, the idea of *scientia* would be gradually abandoned. Syllogistic inference had been increasingly criticized as incapable of producing useful knowledge, and explanations that appealed to Aristotelian essences started to be perceived as empty or unintelligible. The increasing commitment to observation and experimental practices and an ensuing “culture of fact” replaced the conviction that in natural philosophy there is room only for universally and necessary true propositions, and the development and usefulness of mathematical practices shed doubt on syllogism as the only way through which demonstrative certainty could be achieved.

Heritage and Rupture with the Tradition

The ambiguity and heterogeneity of the modern term “science” are undeniable. Some put more emphasis on the instrumentality of potential technological output, some on the nature-controlling aspect, some on the universal laws, some on experimental foundations and empirical methodology, and others on the institutional settings involving laboratories, funding schemes, professionalization, and academies. None of these approaches is helpful in understanding what *scientia* meant in the period between 1350 and 1650. *Scientia* in the first part of this period referred to any body of certain theoretical knowledge which approached its subject (not necessarily nature) in a systematic way and relied on apodictic demonstration. Thus *scientia*, unlike today, involved theology as well, because it was demonstrable knowledge (Lindberg 1978, 1992).

What we understand by the term “science” today, that is, the systematic investigation of nature, would be better described in the Renaissance by the term *philosophia naturalis*, natural philosophy. Even this is not coextensive, however, with the present-day scope of science, because to the category of natural philosophy

“mathematical sciences” should also be added – a sometimes overlapping but sometimes separate category, which included arithmetic, geometry, and “mixed mathematics,” such as optics, astronomy, harmonics, and the science of weights (Lindberg and Shank 2003).

The term “scientia” is a long-standing heritage of Aristotelian logic and denotes an epistemic ideal pursued through several centuries. According to Aristotle’s *Posterior Analytics*, knowledge that conforms to this ideal must consist of propositions that are *universally and necessarily true*. This necessity can be *demonstrated* through *syllogistic inferences* that proceed from premises containing the *cause* of the conclusion. This procedure leads to *certain knowledge* and *understanding* of the *necessary cause* of the phenomena and an *explanation* of why it is the way it is and cannot be otherwise. Being necessary and universal, this knowledge is focused on the *essential structure* of things, and through their essences it accounts not only for how they actually behave, but also for how they would behave in a variety of circumstances. Accordingly, knowledge or *scientia* consisted in a *systematic*, demonstrative presentation of why things behave the way they do, and not in the discovery of the causes from which demonstrations followed.

This ideal started to erode in the Renaissance period. Its various aspects had been challenged and alternative ideals of inquiry had been proposed. As the emphasis shifted from the demonstration of phenomena in accordance with Aristotelian logic and metaphysics to the production of useful knowledge and the standards of intelligibility changed, the idea of *scientia* would be gradually abandoned. Syllogistic inference had been increasingly criticized as incapable of producing useful knowledge, and explanations that appealed to Aristotelian essences started to be perceived as empty or unintelligible. The increasing commitment to observation and experimental practices and an ensuing “culture of fact” replaced the conviction that in natural philosophy there is room only for universally and necessary true propositions, and the development and usefulness of mathematical practices shed doubt on syllogism as the only way through which demonstrative certainty could be achieved.

Questioning various elements of the ideal naturally led to the emergence of new ideals of inquiry and knowledge. Towards the end of the period, competing ideals emerged that would prove to be especially influential for the centuries to come. An alternative ideal of inquiry was put forward by René Descartes, whose method of analysis and synthesis prescribed intuitively clear steps, replacing the Aristotelian standards of intelligibility. Francis Bacon's proposal for the advancement of learning focused on inductive practices such as various ways of collecting facts and their theoretical processing in order to produce useful and only intelligible knowledge. In several respects, Bacon's vision served as a source of justification for Royal Society apologists and as such it proved influential in forming the image of modern science.

By the end of the period, almost all crucial elements of the Aristotelian ideal had been effectively undermined, but the aspiration for certain and systematic knowledge persisted. In this vein, suggestions and rediscoveries from the preceding Renaissance period would be further refined and put to use by Isaac Newton, and many of his followers, who tried to infuse certainty into natural philosophy by deploying mathematical methods. Nevertheless, the limits of the applicability of mathematics repeatedly surfaced in various controversies in optics, chemistry, and life sciences, and forced even Newton to put constraints on the degree of certainty achievable in natural philosophy.

Any understanding of late medieval, renaissance, and early modern science depends greatly on whether we envisage a drastic rupture in the middle of this period, or rather a certain kind of continuity. The debate started a century ago, when the French physicist, philosopher, and historian of science Pierre Duhem (1861–1916) – who literally blew off the dust of medieval scientific codices – argued convincingly against the ruling nineteenth-century paradigm (exemplified by the influential William Whewell) that saw the medieval period as stationary and scientifically unprofitable. In his master work of ten volumes (*Le système du monde: Histoire des doctrines cosmologiques de Platon à Copernic*) relying on

a large corpus of medieval manuscripts, Duhem documented that science was not a seventeenth-century invention. Leonardo da Vinci, Galileo, and the other early modern scientists, he argued, had intellectual precursors among the natural philosophers of fourteenth-century universities, particularly in Paris. For specific historical reasons – paradoxically as a result of the 1277 condemnations of Aristotelian principles by the Church (to be discussed below) – university masters were forced to seek non-Aristotelian ways of solving scientific problems. Their alternative ideas about the motion of the earth, the plurality of the worlds, the infinitely small and infinitely big quantities, and the void, thus paved the way for the sixteenth- and seventeenth-century scientists to find anti-Aristotelian notions of space, time, and motion. Duhem's positive impact is undeniable even though his continuity thesis was far from being accepted by everyone, his enthusiasm to identify precursors of the modern science became a famous methodological mistake in the historiography of science, and he was also criticized for putting too much emphasis on French masters as compared to the British. Among his followers (usually challenging his more extreme claims), Lynn Thorndike, Charles Haskins, E. J. Dijksterhuis, Anneliese Maier, Marshall Clagett, and Alistair Crombie. All contributed with decisive monographs, critical editions, and translations to the history of science supporting some – usually more moderate – claim for the continuity. After Duhem, no historian could imagine that modern science was born on purely late antique grounds and that “the jump over the Middle Ages” would be a possible methodology to follow (Duhem 1913–1959; Lindberg and Westman 1990; Cohen 1994).

Still, advocates of the discontinuity thesis could argue that modern science was not a simple outgrowth of the medieval scientific achievement and that the late sixteenth and the seventeenth century marked a genuinely revolutionary period (to be called the “Scientific Revolution”). The Russian émigré Alexandre Koyré (1892–1964) wished to show that it was not the experimental or empirical nature of Galileo's and Newton's discoveries that made the seventeenth century a

revolutionary period but rather a shift in perspective, a change in the theoretical outlook on the world. As he phrased it: “founders of modern science (...) had to destroy one world and replace it by another.” That the revolution took place on a conceptual level was supported by the influential work of the historian and philosopher of science Thomas Kuhn, who argued in his *The Structure of Scientific Revolutions* that a whole series of paradigm shifts took place in the sixteenth- and seventeenth-century history of science (Koyré 1968; Kuhn 1962).

Today, most medievalists are moderate supporters of the continuity thesis. Both Edward Grant and David Lindberg reject that late medieval and renaissance science should be celebrated as anticipations of later developments; they do not see, however, any sharply definable moment when the revolutionary period would have started. As Lindberg puts it: “in order to demand respect for the medieval scientific achievement, we need not denigrate or diminish that of the sixteenth and seventeenth centuries. We need merely understand that the former shaped the latter and is therefore part of the ancestry of modern science” (Lindberg 1992, 368; Grant 1996).

As a consequence of the decisive impact of Aristotelian philosophy – and this is an often misunderstood issue – late medieval and renaissance science was predominantly theoretical and in many ways nonexperimental. Scientists sought theoretical knowledge for its own sake, that is, for making the world intelligible, and they did not focus on its instrumental aspects. Theoretical knowledge was categorically separated from any technological application and craftsmanship; its aim was not to produce better tools or a more efficient industry but to be reflected upon and to be disputed. Natural philosophy had a certain bookish, that is, textual character, and its content relied on a corpus of authoritative (Greek, Roman, Arabic, Hebrew, and Latin) authors.

The medieval pupils of Aristotle accepted the methodological principle that logic preceded natural philosophy (demonstration preceded observation) and that the universal had priority over the particular (not the exceptions, but the naturally flowing usual processes and phenomena

constituted the subject of *scientia*). In the Aristotelian tradition, *ars* and *natura*, the artificial and the natural were believed to belong to two separate realms, the first not being informative about the second. In such a perspective, controlled and repeatable experiments could not obviously play the same role as they do in contemporary science. In addition, experience and experiments were not consistently distinguished in the Middle Ages, and curiosity – being a sin in the Christian framework – had a low reputation.

All this does not mean, however, that science was exclusively theoretical and lacked purposeful experimentation. Empirical observation, measuring, and to a certain extent experiments played an important role in medicine, astronomy, astrology, optics, and botany. Authors of natural philosophy often affirmed that a given claim was tried and tested (*probatum est; expertus est*), even though experiments had more a confirmational and illustrative, than a discovering, role. Alchemy, not being a university subject but available on the bookshelves of both medieval masters and members of religious orders, represented a serious challenge to the Aristotelian notion of science. With its interfering attitude into natural processes and its experimental ambitions, alchemy argued explicitly against the sharp *ars-natura* separation and against the generally accepted idea that artificial experiments (constraint motions) could not produce relevant knowledge in regard to natural phenomena (Lindberg 1978; Eamon 1994).

Various branches of natural philosophy were clearly distinguished in the texts (physics, optics, medicine, astronomy, astrology, natural history, science of motion, science of weights, geography, metallurgy, meteorology); this does not imply, however, that different types of professional scientists (specialists of biology, physicists, etc.) existed. Science (with the exception of the medical career and courtly astronomy and astrology) was not a separate profession. In the first part of the period under study, scientists were trained in universities, but one could not have a degree in a specific science, only in all of the liberal arts. Consequently, scientific facts, results, and argumentations were presented not only in treatises devoted to specific subbranches of science but

also in biblical commentaries, theological tracts, metaphysical, philosophical, logical, and other treatises (Lindberg and Shank 2003).

Late medieval scholastic science can be rightly characterized as the Latin reception and rearticulation of the Greek scientific heritage transferred and modified by Islamic civilization. This heritage (Aristotelian philosophy, Platonic cosmology, Ptolemaic astronomy and astrology, and the medicine of Galen) provided an elaborate account of the cosmos and how it should be investigated, and it thus gave a huge impetus to the evolution of Latin *scientia*. But – as the Aristotelian corpus contradicted in some important points the teachings of the Church, particularly in respect to the eternity of the world, the nature of the soul, and the determinism of the universe – the Christian rearticulation was not without conflicts. Although the hostility of some influential Church fathers, most notably, Tertullian, towards Greek philosophy and scientific tradition is undeniable, Augustine's (1958) handmaiden formula provided justification to the pursuit of philosophy and science. The idea that the classical scientific tradition could be seen as the handmaiden of religion and theology was further elaborated by Roger Bacon, Robert Grosseteste, Albert the Great, and Thomas Aquinas (1967, 1987), who worked hard on rendering Aristotle compatible with religion. Thanks to these attempts at reconciliations, and also to the fact that the trainings, practices, and careers of theologians and scientists – as well as these very persons – were not always distinct, sometimes overlapped, and sometimes were even identical, and that all scholars were formed in both theology and science, classical science got successfully appropriated by the Church and was to a large extent Christianized (Grant 2001; Lindberg and Numbers 1986).

This was the notion and practice of science inherited by the renaissance era. In the course of the period under study, the characteristics above underwent serious modifications. The authority of Aristotle in the methodology of scientific endeavor, as well as the Aristotelian dichotomies (*ars-natura*, general-particular) organizing the content of science gradually subsided. Simultaneously, the variety of institutions, as well as the

number of the roles associated with scientific activity drastically increased, due to the differentiation of subdisciplines within science and the growing specialization and mobility of its practitioners. Instead of the restricted attitude towards the application of scientific theories that characterized the Middle Ages, more space was given to cooperation between science and crafts. Experience – never completely missing from the scientific practice – got new forms and new roles in scientific demonstration and confirmation. These changes led to the modern notion of science on the grounds of the heritage of the Middle Ages.

By the time Aristotelian understanding of what science is and what it is not, how it is supposed to be done, and what differentiations it encompasses (universal vs. particular, artificial vs. natural) was properly appropriated, first signs of the rupture with the tradition appeared. The 1277 anti-Aristotelian condemnations in the Paris University, so central to Duhem's precursor hypothesis, mark the beginning of the quest for new solutions. But the process was slow; the following 300 years can be described as a period of gradual alienation from the received tradition. There are many different theories about the causes. One is particularly relevant to Renaissance science, not because it is widely accepted but because of its inspiring nature. Frances Yates put forward the idea in a series of influential monographs in the 1960s and 1970s that modern science was not born on the grounds of late medieval scholastic science but rather as a result of the impact of the hermetic tradition. The heliocentric model, the intense use of mathematics, the idea that the scientist should interfere in natural processes and construct artificial experiments, and the new habit of gathering together in scientific societies and later in academies are all central characteristics of seventeenth-century science inherited from the philosophical-magical tradition based on the texts of the legendary Hermes Trismegistos and represented by Marsilio Ficino (1989), Cornelius Agrippa, John Dee, and other protagonists whose names hardly appeared in earlier histories of science. Although far from being accepted, Yates' theses rendered the neoplatonic, magical, and hermetic intellectual currents of the Renaissance an indispensable

topic in the summaries on early modern science, including Nicolaus Copernicus, Francis Bacon, Isaac Newton, the national academies, and the new methodology (Yates 1968; Merkel and Debus 1998; Westman and McGuire 1977).

Innovative and Original Aspects

While there is a continuous debate on what exactly changed in the content of *scientia* during the Renaissance, there is a common agreement on how the scenes and roles of *scientia* were modified. “Scientists” in the late middle ages were all university professors or university-trained court intellectuals, usually – with the exception of medicine – trained in all scientific fields. While disciplines interpenetrated each other, the possible career paths, as well as the possible scenes of scientific activity, were very limited. This is probably the field where the early modern era brought the most serious modification: the range of roles, career options, and scenes of scientific activity dramatically broadened. Besides the university, the royal or princely court, and the monastery, during the Renaissance, the laboratory, the library, the academy, the botanical garden, the anatomy theater, and to a certain extent the piazza, the market, and the coffeehouse had also become possible scenes. Instead of multidisciplinary intellectuals and universal savants of the Medieval universities (such as Grosseteste, Roger Bacon, Jean Buridan, or Nicole Oresme), specialists of particular fields populated early modern science (like Niccolò Tartaglia in ballistics, Andrea Cesalpino in botanics, Conrad Gesner in zoology, and Georgius Agricola in mining and metallurgy). Genres of scientific literary production also changed (Lindberg 1978).

In the Renaissance period, there were many aspects of theoretical innovation that existed together with more traditional currents in the field of natural philosophy. Beyond doubt, one of the most provocative new insights concerned the status of mathematics. The vigorous revival of the Platonic and neopythagorean traditions in the fifteenth century, fueled by the stream of Greek manuscripts and scholars arriving in Italy after the

fall of Constantinople, brought with it the reappraisal of the studies of mathematics which was to develop into a powerful alternative to the scholastic logic in the centuries to follow. The humanist rediscovery of the Hellenistic mathematical texts (Archimedes, Pappus, and others), the commerce of previously unknown Greek manuscripts, the Latin and vernacular translations all contributed to the process of reshaping the map of the *scientiae* by reclaiming the high esteem and ancient pedigree of mathematics. Nevertheless, its eminent position in the hierarchy of the disciplines was anything but self-evident.

According to the 1563 *Oratio pro idea methodi*, a famous speech delivered by Petrus Catena (1501–1577) in Padua, the excellence of any discipline has to be assessed from three different points of view: its certainty, the nobility of its subject matter, and its usefulness. As regards mathematics, its deductive method based on definitions and axioms – self-evident propositions regarded as common knowledge (*koinai ennoiai*) – had served as the most rigorous model of certainty for all other sciences ever since its first systematic elaboration in the antiquity. This did not mean, however, that arithmetic or geometric arguments were supposed to lead up to physical conclusions. Traditionally minded peripatetic commentators maintained that mathematical abstractions failed to do full justice to the complexity of nature and stopped short of allowing for perfect demonstration in the Aristotelian sense of the word. The reason is that they did not provide causal explanations, a necessary condition that all bodies of knowledge were expected to meet when aspiring to the highest ranks of the sciences. (This is one of the reasons behind the rejection of Copernic’s heliocentric view in spite of its undeniable mathematical advantages in the description of the planetary system.)

A decisive step was made in Padua by some commentators who struggled for a thoroughgoing mathematical reading of Aristotle’s physics. These dialecticians insisted on the highest status of the *Mathesis* against their Aristotelian colleagues of strict obedience who maintained that scientific explanation must be based on demonstrations (i.e., on proofs accounting for the

phenomena through their natural causes). One of the best expositions of the new claim was the aforementioned inaugural speech held by Petrus Catena (1563). The same view is echoed in the famous preface to the first English translation of Euclid's *Elements* (1570), written by John Dee (1527–1608/1609). Exploring the respective values and the hierarchy of the *scientiae*, Dee gave prominence to mathematics over all physical disciplines not only for the utmost certainty produced by mathematical deductions but also for the metaphysical nature of its subject matter (the *Thynges Mathematicall* as he termed them). The theory of the middle status of mathematical objects represents an important shift in the conception of the physical world. A similar debate took place in the context of late scholasticism both in the Iberian peninsula and in Italy (where the issue loomed large in the writings of Christopher Clavius, a Jesuit professor of mathematics in the *Collegio Romano*, cf. Blum 2012, 117; Armogathe 2007, 58 sqq).

Another important challenge to the traditional view came from the new classification of certain studies known as middle sciences (*scientiae mediae*), a category that allowed for positioning a whole range of “mixed” studies between physics and mathematics (Blair 2007, 289–290). The association with mathematics endowed these disciplines (e.g., mechanics, ballistics, navigation) with a new prestige, in virtue of which the sharp difference between sciences and arts blurred and yielded the place to less rigorous demarcations. John Dee, for instance in the preface to Euclid, speaks indiscriminately of *Mathematicall sciences* and *Artes Mathematicall*.

In many respects, this mixture, composed of Pythagorean and empirical elements, set the stage for the new scientific outlook of the early modern age. It was typical of the work of Galileo Galilei (1564–1642), who made an enormous impact on his contemporaries by his refined way of joining together the mathematical and the experimental aspects of the inquiry. On the one hand, he famously compared Nature to a book whose characters were written in the language of mathematics (Galileo 1623), but on the other hand, he equally stressed that the

content of the book cannot be grasped without empirical observations. The ensuing amalgam of the “reasoned facts” was emphatically not meant to facilitate either a priori speculations or the naive empirical reliance on the deliverances of the senses. Viewed against this background, Galileo's frequent appeal to the observation of the facts, to which preference is always to be given over the idle speculation, might be misleading. Some of the problems involved were reflected in the worries that Galileo's critics expressed about the intrusive nature of his observations and the active role played by the experimenter who, not content with being relegated to the position of a passive recipient, manipulated either the situation observed (as in the case of the free fall of bodies) or the process of gathering information (as in the case of celestial observations based on artificial instruments – telescopes, optical lenses, mirrors etc.).

A similar issue concerned Galileo's ignoring the traditional division of the universe into two different physical realms, the sublunar system (dealing with finite and mostly linear motions) and a supralunar one (in which the relevant motions are circular). Galileo's crossing this line of demarcation required to give up the ideal of the direct empirical stance attached to the point of view of the observer in favor of an indirect approach in which the meaning of the “facts” must be spelled out in terms of mathematics. The importance of this move cannot be over-emphasized. It gave rise to a new conception of the philosophy of nature as a discipline that is not supposed to provide the description of a *unitary cosmos* as it unfolds before our senses but consists of the search for *unitary laws* that obtain everywhere in the universe. Thus, the emphasis shifted from more or less spontaneous observations that should have given access to the nature of things, to experiments documenting merely *phenomena*, or appearances that require further interpretation and rational reconstruction if their latent structure and the governing laws are to be spelled out.

Galileo was also innovative in two further aspects. First, he resolutely maintained that the observation of nature cannot possibly interfere

with religious tenets since these two fields of interest are engaged in different projects (McMullin 1997). As he stated succinctly in a letter to the grand duchess Christina: what the Bible teaches us is not how the heavens go but how to go to heaven (Galileo 1615). This strategy, albeit proved unsuccessful in his personal life (cf. with his trial), became one of the standard positions in the debates of the centuries to follow.

Another innovative aspect of his thought worth mentioning is the way in which he captured the imagination of his age by his exceptional ability to advertise his achievements. His *Sidereus Nuncius* and the *Letter on Sunspots* (Galileo 1610, 1612), texts that can be regarded as the first scientific bestsellers of the modern era, are masterpieces of succinct but powerful exposition of facts coupled with the visual rhetoric of the images. Galileo was very talented in making credit to his views by reaching a wider audience through his books and extended correspondence by selling or presenting self-made optical devices, making use of the existing network of scientists all across Europe, and finding princely patronage (Biagioli 2006).

The latter point draws attention to a common phenomenon since practical and mathematical approach championed in one way or another by many of Galileo's contemporaries and predecessors was given a lift in prestige from the sixteenth century onward by its technical and military applicability (Devries 2006). It was especially through this practical aspect that middle sciences gained the highest esteem among the "military gentlemen" and enjoyed generous princely patronage throughout the early modern age. In fact, they were perceived as part and parcel of a larger group of arts requiring mathematical skills in a wide range of technical applications (cartography, military engineering, painting, gardening, architecture, and so on).

Nevertheless, the joining of mathematics with other subjects was far from being uncontroversial in the epoch. One of the most popular approaches to *scientiae*, elaborated by the Huguenot scholar Petrus Ramus (1515–1572) as part of his general reform of the higher education, sought to set the boundaries of each discipline in such a way that precluded any blending of the terms used in one or

another branch of the sciences. Because he regarded philosophy as an aggregate of well-defined and autonomous disciplines, each based on its distinctive axioms and theorems and allowing for no overlap, he was against trespassing the boundaries of the mathematical and physical studies, a move inherent in Copernic's results. He condemned the mathematical physics of the *De revolutionibus* as a clear instance of what he regarded as a *metabasis* in the Aristotelian sense. With this theory in mind, Ramus's aim was more to arrange and systemize the scientific propositions (running in his schemes from more general to more specific ones) for educational purposes than to provide a method of invention enhancing scientific advance. Though in this sense he did not engage in the epistemology of the sciences, he had an enormous impact on subsequent generations of scholars by his insistence on the right method. His pedagogical concerns complied with the need of the modern state demanding well-educated officers, businessmen and craftsmen, and his pragmatic approach gave a new impetus to the practical side of the sciences.

One of Ramus's methodological devices was the extensive use of the analytic and synthetic ways of reasoning characteristic of the Renaissance period. The combination of these methods stems from a major problem well known from the late antiquity onwards, the discrepancy between the theory of demonstration as can be found in Aristotle's *Posterior Analytics* and the scientific practice exposed in his physical and biological tracts. Nowadays, this problem settled either by denying that the syllogistic method (put forward in the second *Analytics*) was meant to provide a true theory of demonstration, or by minimizing the differences between the two approaches. The same issue gave rise to competing methodologies in the Renaissance, the most important of which is known as *demonstrative regress*. This theory of demonstration tried to combine the two separate components of the Aristotelian method into one coherent scheme. The first component of the amalgam was the *demonstration of fact*, an *a posteriori* demonstration that commentators opposed to the second step that called a *demonstration of reasoned fact*. Whereas the first

provided an argument without giving the proximate cause of the phenomena concerned, the latter referred to their causes in the middle term of a syllogism. Put together, they provided a complex circle of demonstration whose first step was an inductive proof which, on the basis of empirical observations, established the causes of an effect. This step was called *resolution* (or analysis) since the initial state of affairs was decomposed into its simplest constituents thereby. The second step of the reasoning takes the opposite direction; it consists of a syllogistic reasoning supposed to deduce the effects from which the causes had been spelled out in the first phase. This second step is called *compositio* (composition or synthesis) since it allows for the reconstitution of the phenomena via their causes. What prevents this double method from degenerating into a vicious circle is the logical necessity inherent in the process of deduction. While in the first place the causes are established by mere observation, the second step is preceded by a meditation on the nature of the causes detected (this was called *consideratio* or *negotiatio*), so that the subsequent deduction does not merely produce the effects but it shows that they are logically connected to or contained in the nature of the causes.

A further aspect of novelty is closely connected to this point. As a result of the geographical discoveries and the abundant flow of information made available by the printing press, this period was especially marked by a new passion for the empirical investigation into the secrets of nature (Shapiro 2000). The new appetite for the rarities; the practice of anatomical dissection, collecting, and dressing up inventories; and founding museums, cabinets of curiosity, and *wunderkammers* all reflected the desire to capture the cosmic harmony reflected in the particular beings (specimens of herbs, minerals, animals, etc.). This interest contributed to the effort of the methodical arrangement of the material in combinatorial schemes, diagrams, or in the form of universal encyclopedias.

This feature of the Renaissance science is particularly marked in the philosophy of Gottfried Wilhelm Leibniz (1646–1716), who – in sharp contrast with Descartes, Malebranche, and other

Cartesians – expressed a clear preference for the formal criteria of knowledge over the role of the intuition in the quest of certainty. Leibniz's life-long preoccupation with the mathematical and experimental facets of the new natural philosophy along with his constant appeal to combinatorial method and universal harmony shows that no sharp dividing line existed between Renaissance and early modern scientific concerns.

His project of the science was based on the dream of a “universal language.” In accordance with the efforts of Athanasius Kircher, George Dalgarno, John Wilkins, and others, he attempted to set up a comprehensive vocabulary whose well-defined terms ruled out all ambiguity inherent in the natural languages. Inspired partly by Ramon Lull's *Ars magna* and partly by Thomas Hobbes' view that true reasoning is nothing else but a calculation, Leibniz assumed that through the systematic recombination of the symbols attached to the terms of the universal language, reliable knowledge can be achieved (Leibniz 1666). He insisted that in this systematic way, one can pursue both theoretical and practical goals. On the theoretical level, the method promised an *ars inveniendi*, a practical way of acquiring new pieces of knowledge. Since the primitive terms – like the letters of an alphabet – were conceived to refer to the elements of the human thought, their combination according to logically correct rules provided a means to elicit the consequences implicit therein (Buzon 1998, 619–620). This gave rise to the Leibnizian concept of “blind thought,” a process of mechanical reasoning (something that even the early modern calculating machines were supposed to realize), unaccompanied by attention and consciousness.

On the level of practicalities, the ideal of the *Mathesis Universalis* went hand in hand with an “art of memory,” and a project of educational reform, both based on the methods, arrangement, and processing of symbols much in the same way as a calculating machine can manipulate them. The whole effort resulted in an ambitious political program aiming at social, religious, and political peace warranted by a universal jurisprudence whose task was to harmonize different point of views and opposing interests. Influenced by some

scientists of millenarist leaning who, in one way or another, were associated with the reformed university of Herborn (Alsted, Bisterfeld, Comenius, and other “Herborn encyclopedists”), Leibniz believed that the proponents of the various philosophical and religious groups, engaged in fierce debate throughout the history, all glimpsed the same truth which, in its rich totality, could only be comprised in encyclopedias.

Nevertheless Leibniz’s preoccupation with the formal aspects of knowledge was only one of the possible ways of arranging the huge amount of information emerging in the various fields of inquiry. Another powerful method was that of Francis Bacon (1561–1626), who at the beginning of the seventeenth century initiated a full-scale revision of the Aristotelian ideal of knowledge. He proposed a new classification of knowledge with an intention to turn natural philosophy from a theoretical enterprise into a productive one whose chief virtue is not so much intelligibility, but instrumentality. In order to do so, Bacon stepped outside the framework of Aristotelian division of knowledge and its emphasis on metaphysics as its foundation that provided the unifying categories of natural philosophy and thereby blocked the way of methodological innovation. Particularly, the Aristotelian requirement of deriving explanations from “essences” posed a constraint that made irrelevant the study of things in contrived situations.

With his new division of knowledge, Bacon gave a new orientation of inquiry in which emphasis on the demonstration of phenomena gave way to discovery as the central focus of knowledge production. In Bacon’s division, knowledge of nature is divided into natural history and natural philosophy. He conceived natural history as a descriptive enterprise aiming at collecting and organizing observations of phenomena, and natural philosophy as an explanatory enterprise aiming at distilling the principles underlying phenomena so that they could be manipulated for the benefit of mankind. In the context of natural history marvelous, preternatural and contrived experiences gained a significance that could not be accommodated in *scientia*, because only the normal course of behavior can be demonstrated from

essences – abnormal phenomena or experimental findings has nothing to do with the essence of things as they arise from contingent circumstances. Bacon’s “experimental natural history” was conceived as producing situations that would not exist in nature without human intervention, that is, it increasingly meant an artificial step in knowledge production. On these grounds, natural philosophy was liberated from the constraints the ideal of *scientia* had placed upon it and thus opened up the possibility of transforming natural philosophy into the instrumentally useful enterprise that Bacon envisaged.

Studying and accounting for the natural as well as unnatural behavior of things is at the heart of Baconian natural philosophy as this gives the key to transforming nature to our benefit – an aim that again alien to the Aristotelian ideal that seeks to provide contemplative understanding by demonstration. Correspondingly, inductive inference replaces demonstration in the Baconian ideal: the “ways of true and good induction . . . can help the frail and crippled faculty of human intellect towards the sciences” (Bacon 1609, 4/5). Far from being a never-ending enterprise, fact collecting for Bacon is “the only enterprise that allows us to proceed with certainty” (Bacon 1609, 6/7).

And although the quest for certainty remains very much in the focus of sixteenth-century epistemic ideal, for Bacon this certainty did not arise from the mathematical treatment of facts collected. Mathematics for him served primarily educational purposes through strengthening mental capacities, and in *De Augmentis* he explicitly warns against mathematics taking over natural philosophy and confines it to an auxiliary role.

Though providing an abundant source of inspiration, Renaissance scholarship also bequeathed its latent tensions to the subsequent generations, and one fissure, becoming more and more palpable throughout the sixteenth century, concerned the mathematical and the empirical components of the amalgam that composed the new natural philosophy. These elements gave rise to different epistemologies depending on the emphasis scholars put on one or the other of part of the mixture. According to Agostino Nifo

(1473–1538/1545), the knowledge of the causes in the explanation of the natural effects through methodic resolution (*via resolutiva*) is always conjectural and, for this reason, the subsequent deduction of further effects (*via compositiva*) counts as a demonstration only in a very limited and improper sense. Claiming that the whole process is based on probable conjectures, Nifo's approach underscores the lower status of the philosophy of nature which, on this interpretation, cannot attain the highest level of mathematical certainty. Hence, Nifo insists that "the science concerning nature is not science absolutely as is mathematical science, but is science *propter quid*, because the discovery of the cause, which is obtained through conjectural syllogism, constitutes the reason for the effect" (Jardine 1988, 689). By some scholars, Nifo's view has been alluded to as one of the first expressions of a moderate skepticism which, according to the thesis of Richard Popkin, was on its way to evolving into one of the standard epistemological positions of the seventeenth century (Popkin 2003). In Jacopo Zabarella (1533–1589), we find an opposite approach to the problem. He did not regard induction as an inferential method necessary for gathering scientific knowledge, rather the role he assigns to it is just to produce images that dispose of the intellect to receive the *universal* forms produced in the human mind by a transcendent active intellect. Demonstrations, Zabarella insists, rely on transcendent principles.

Descartes (1596–1650), though in his thought the role of the active intellect is replaced by innate ideas, would take the same stand some fifty years later. Descartes in his *Principles of Philosophy* (1644) presented an influential vision of the system of sciences as a tree, the branches of which grow out of the trunk of metaphysics. Descartes's original vision of method that underpinned this unity prescribed analysis into intuitively clear and infallibly known metaphysical principles, the world's basic constituents, "simple natures" whose knowledge is innate and from which deductive knowledge in physics and other fields of knowledge is attainable.

The Cartesian ideal of knowledge diverges in several respects from the Aristotelian ideal while

preserving some of its characteristics. Descartes was still devoted to the ideal of *scientia* insofar as far as the aspiration to certainty is concerned. This certainty, however, was not supposed to be reached through demonstration by syllogistic inference that Descartes severely criticized as a useless logical instrument for discovery. Instead, he advocated a method of analysis and synthesis, that is, by breaking down complex questions into simple ones to which intuitively clear and distinct answers can be given and then proceed from these intuitive answers to answering complex questions. The demonstrativity of this process is preserved by intuitive insight: each step in the process follows intuitively from the previous one, and the reliability of this process is not due to the rule of syllogistic logic but the benevolence of God. God's benevolence entails that he does not intend to deceive, and it guarantees the reliable functioning of our faculties in the process of *cogitatio*.

The Cartesian ideal also diverges from the classical in that it does not consist exclusively of universal and necessary truths. A robust system of metaphysical knowledge is built upon Descartes's *cogito*, "I think therefore I am." So it is part of a systematic body of knowledge (i.e., Cartesian metaphysics); it is necessary and its certainty cannot be doubted. However, it is a singular proposition and as such it cannot meet the standards of Aristotelian *scientia*. A further complication arises for necessity as in Descartes necessary truths depend on divine will, so strictly speaking they are not necessary. This illustrates again the crucial role God plays in the Cartesian ideal of knowledge, and this gives a further distinctive feature if compared to the Aristotelian ideal.

God also plays a different and increasingly important role in the period. Roger Bacon in the thirteenth century vindicated philosophy as a remedy from the unfortunate consequences of the fall, and this vindication had remained valid for many even in the eighteenth century. Besides, a further vindication of natural philosophy had become a commonplace by the end of the Renaissance period. As several humanist works on anatomy and nature, or for example as Melancthon's program for education and Bacon's vision for

knowledge production make it clear, knowledge of God emerged as an increasingly important aim of inquiry natural theology, or physicotheology as it is sometimes called, it was unquestionably an important part of natural inquiry, and its significance would be preserved and even increased in the century to come. The need for a discipline that aimed at an understanding of God through the study of his creation arose from the widespread conviction that the world is the product of God's handwork. As such, God's intentions, attributes, and purposes were naturally taken to be reflected, to some significant degree, not only in the Bible but in his creation as well: God had written two books to be studied by different means, that is, the Bible and the "Book of Nature" (see Shapin 1996). Being the two books ascribed to the authorship of God, knowledge about the world perceived as God's creation had to be reconciled with knowledge contained in Holy Scripture perceived as God's word. In this enterprise, the resources of natural philosophy and theology had to be combined so as to reach a joint cognitive purpose: a Christian understanding of the world.

Impact and Legacy

Much of the further transformation of *scientia* into "science" as we know it today has taken place under the aegis of The Royal Society, founded in 1660, and within the framework of what its apologists labeled as "experimental natural philosophy." The knowledge making practices associated with this label had been vindicated by a Baconian ideology focusing on producing beneficial knowledge and making the world intelligible through the collection of empirical and the production of experimental facts.

With the Baconian ideology, the Royal Society also inherited the aspiration to understand the world as God's creation. This orientation of early modern natural philosophy is one of the most contested issues that arise concerning the continuity of natural philosophy and modern science. As Stephen Gaukroger points out, Royal Society apologists like Robert Boyle and Thomas Sprat "were talking of natural philosophy in terms of a

religious office," and natural philosophy was taken as a non-partisan way – that is, one free of sectarian confessional issues – of engaging religious questions of divine nature and purpose (Gaukroger 2010, 30). Andrew Cunningham (1991), in a similar vein, sees the role of natural theology in early modern natural inquiry as so central that on this basis he denies the continuity of natural philosophy and modern science. Natural philosophy is about God even when its practitioners are not talking about him, a feature entirely uncharacteristic of modern science: "no-one ever undertook the practice of natural philosophy without having God in mind, and knowing that the study of God and God's creation – in a way different from that pursued by theology – was the point of the whole exercise." And even if John Henry's verdict in the debate surrounding Cunningham's thesis may very well be true, namely, that "[n]atural philosophers, after all, were not theologians, and would have seen it as a betrayal of their natural philosophical principles to invoke God's direct intervention in their explanations" (Henry 2009, 110n65), the conviction that natural philosophers are studying God's creation provided the basic ideological framework of early modern science: this was a background presupposition against which significance of the enterprise was perceived and the ultimate meaning to its findings was ascribed. This ideology of knowledge was not superadded to the works of knowledge production: it was an intimate and unavoidable part of the framework of intelligibility and not external to knowledge claims themselves (Shapin 1981).

Behind the curtains of this ideology, the actual practices of knowledge production had been focused on inductive methods that could only yield probable, but not certain and demonstrative, knowledge by the standards of *scientia*. Such prominent figures as Robert Hooke and Robert Boyle deemed both syllogism and mathematics unsuitable to introduce demonstrative certainty into experimental philosophy, whose aspirations would thus be constrained to the realm of probabilities and not certainties. But this seemed less and less a shortcoming to many naturalists of the time: as the received Baconian ideology of inquiry

emphasized the value of instrumental knowledge, the cognitive merit of probabilities also increased as they promised potential, even if as yet unforeseeable, utility. So, even if probabilities cannot meet the standards the ideal of *scientia* set for the products of inquiry, their cognitive benefits are increasingly admitted.

The ideal of *scientia* is still lurking behind this process, as knowledge claims are typically evaluated against the background it defines. John Locke in his influential *Essay Concerning Human Understanding* distinguishes three kinds of knowledge: “intuitive,” “demonstrative,” and “sensitive.” The first two kinds are different only in degree, as demonstration consists of a series of intuitive steps in reasoning as in mathematics. Sensitive knowledge concerns “the particular existence of finite Beings” (Locke 1690, 4.2.14) and as such it is different in kind because it is incapable of certainty. As such, sensitive knowledge is sufficient for practical purposes, “for the use of Life,” but it is not sufficient for a “perfect, clear, comprehensive Knowledge of things free from all doubt and scruple” (Locke 1690, 4.11.8). Accordingly, the knowledge derived from experimental philosophy is founded on sensitive knowledge and as such it can only be probable. But this is not a shortcoming that should prevent us from conducting inquiry on this ground: in the *Essay* Locke himself admittedly followed a Baconian “historical, plain method” (Locke 1690, 1.1.2) in producing what is in effect a natural history of human understanding: a description and classification of various cognitive capacities.

Many early Royal Society apologists thought that mathematical demonstration can yield certainty, but they saw its sphere limited. Trust in what mathematics can achieve increased with the publication of Newton’s *Principia* (1687) with its project of introducing certainty into experimental natural philosophy through mathematical principles. As Newton claims in his early papers, as long as phenomena are treated by mathematical reasoning, the science of them is mathematical as well, and consequently, it can reach the same degree of demonstrative certainty as mathematics. Initially, many Newtonians, including John Keill,

John Friend, and Archibald Pitcairn, adopted this mathematical outlook on various phenomena and attempted to provide mathematical theories of phenomena in chemistry and physiology. Several decades later, however, as a result of the ensuing controversy with Anthony Lucas and Robert Hooke concerning the degree of certainty to be ascribed to such reasoning, Newton’s (1704) commitment would soften when he claimed in Query 31 of the *Opticks* that “arguing from Experiments and Observations by Induction be no Demonstration of general Conclusions; yet it is the best way of arguing which the Nature of Things admits of, and may be looked upon as so much the stronger, by how much the Induction is more general.”

Unlike the strong tendencies to mathematize nature, the emphasis Newton placed on the significance of experiment never diminished. It is Newton’s enduring aspiration to insulate experimental philosophy from metaphysical challenges, no matter if they come from Aristotelian, Cartesian, or whatever denomination. A chief epistemic commitment he repeatedly made clear is that experimental findings should not be exposed to other than experimental criticism.

The centrality of experimental practices in knowledge production led to a revision of cognitive ideals in natural inquiry. Instead of certainty and demonstrativity, a probabilistic and fallible conception of natural philosophy started to take shape. This is reflected in the division of knowledge that David Hume (1739/1740, 1.3.11.2) suggests. Hume’s division is tripartite just as Locke’s from some 50 years earlier, but it is divided differently into “demonstration,” “proof,” and “probability” and seems to be in concert with Newton’s use of “demonstrations” and “proof” (see Stein 1990). Demonstration is the field of a priori reasoning, i.e., paradigmatically of mathematics. Proofs and probabilities fall into the category that Locke labeled as the field of “sensitive” knowledge, but proofs, albeit fallible in principle, come close to certainty because they are founded on uniform experience.

According to Hume’s division, natural philosophy can aspire to a degree of certainty that falls short of being demonstrative, but still certain enough to be unanimously reliable and

instrumentally useful. These features are easily discernible in the self-image of modern science that emerged gradually as a result of putting forward, and putting into use, alternative conceptions and practices of knowledge production. This has been a long process, and its several crucial steps have been taken in the Renaissance period that, as a consequence, also witnessed the demise of the ideal of *scientia*.

Scientific Academies in the Renaissance

Giulia Giannini

Max-Planck-Institut für Wissenschaftsgeschichte (Berlin), Berlin, Germany

Abstract

The first Renaissance academies developed around the middle of the fifteenth century and had a primarily encyclopedic character. The main trait of the knowledge cultivated in their first phase was the revival of the classical culture. On the one hand, they fostered a renewed interest especially in Platonic philosophy, and on the other hand, they cultivated the dream of a somewhat all-embracing knowledge.

Vernacular literature, liberal arts, music, mathematics, and the study of nature were all parts, within the fifteenth to sixteenth-century academies, of a wider landscape of interests.

It is exactly this tension and strife towards a unifying and organic picture of knowledge that threatens any attempt at formulating a classification of themes and contents that were addressed by the first renaissance academies.

The question of the scientific academy in the Renaissance should thus be posed and defined considering on the one hand the relation with the wider academic phenomenology and on the other hand with the birth and rise of the “new science,” in particular when it comes to the very process that science underwent in order to be autonomous from an organic and homogeneous view of knowledge, a view that was exactly the hallmark of that model in which the academies were born.

Heritage and Rupture with the Tradition

The expression “scientific academies” traditionally refers to those state-supported learned societies that, from the second half of the seventeenth century, carried out collective, experimental research and were regulated by a system of

norms or by a formal charter. The emergence of academies such as the *Royal Society* in London (1660), the *Académie Royale des Sciences* in Paris (1666), or the *Kurfürstlich Brandenburgische Societät der Wissenschaften* in Berlin (1700) is closely connected with a progressive specialization of the different types of learning that was largely foreign to the Renaissance conceptions of knowledge. And yet, it is precisely during the Renaissance that the Academy model developed and spread.

Starting especially with the groups that originated c. 1440 around renowned humanists such as Ottaviano Rinuccini and Marsilio Ficino (► [Ficino, Marsilio](#)) in Florence or Pomponio Leto and Cardinal Bessarione (► [Bessarion, Cardinal](#)) in Rome, hundreds of various types of academies flourished and thrived throughout the Renaissance (► [Scientific Academies in the Renaissance](#)). Many such learned societies entertained close connections with the courts, with their dynamics, and with the unstable political and dynastic lives of the *signorie*; and all of them depended on the initiative and the patronage of a prince or an aristocrat to survive. For this reason, academies were not only numerous, but also quite ephemeral, often lacking a structure and a defined program.

An almost exclusively Italian phenomenon, Renaissance academies are de facto a product of humanistic culture, of aristocratic patronage, and of the polycentric cultural life of the time in Italy.

The first scientific academies were born in this context and represent, at least at the beginning, a variation on the humanistic academies of the Renaissance.

Innovative and Original Aspects

In his monumental *Storia delle accademie d'Italia* (5 vol., Bologna, 1926–1930), Michele Maylender identifies the Accademia dei Fenici, founded in Milan around 1550, as the first “scientific” academy. The activities carried out by this academy are documented, according to Maylender, in Book I of Bartolomeo Taegio’ *Il Liceo* (Milan, 1571), which discusses “the order

of the Academies and the Nobility.” The encyclopedic program described by Taegio is structured around ten monthly meetings or congregations, each devoted to a different subject and entirely carried out in the vernacular: dialectic, rhetoric, poetry, natural philosophy, metaphysics, arithmetic, moral philosophy, household and state government, and reading of academic works. Although it is difficult to determine whether Taegio is actually referring to the Accademia dei Fenici, the program of activities described in *Il Liceo* appears to provide a faithful picture of the relationships between science and the academies around the mid-sixteenth century.

Signs of interests that nowadays would be defined as scientific are also found in other “mixed” academies of the time, such as the Accademia degli Infiammati in Padua (1540–1550), the Accademia Fiorentina (Florence, 1541), the Accademia degli Affidati in Pavia (1562), or the Accademia degli Unanimi in Salò (1564). Among their activities are topics connected with arithmetic, cosmography, geometry, or philosophy of nature, which in turn entertain an organic relationship with more classical forms of learning. Only from the mid-sixteenth century do academies begin to focus on specific disciplines and thus evolve into increasingly more formalized and structured institutions. This process began with literary academies and later developed among scientific institutions – not only were the latter significantly fewer than the former but at least until the end of the seventeenth century they often lacked an organized structure and a program.

The academies devoted to figurative arts and drawing are in this respect an exception. Besides being considered among the most specialized scientific academies, they were also some of the most regulated and institutionalized ones. The year 1563 marked the foundation of the Accademia delle Arti del Disegno in Florence, under the influence of Giorgio Vasari (► [Vasari, Giorgio](#)). The academy’s main purpose was to foster collaboration between artists, and from 1569 it also officially included mathematics, anatomy, and perspective among its fields of study.

The belief that mathematical sciences played a fundamental role in the new political and military

organization of the state brought Cosimo I to create one of the first academies endowed with a legal status and financed by the state. Like the *Académie Royale de Peinture et de Sculpture* – founded in France in 1648 and reorganized by Louis XIV in 1661 – the Florentine academy of drawing had a formal charter, was directly supported by the king and, more importantly, included teaching among its activities, something that academies both in the Renaissance and in modern times did not normally offer.

On the other hand, information regarding the academies devoted to the study of nature is very scarce at least until the Lincean experience.

In the proem to his *Secreti nuovi di maravigliosa virtù* (Venice 1567), Girolamo Ruscelli (c. 1518–1566) describes an academy “kept and called *secreta*” that he helped to establish in Naples. With the exception of his statements, there is no evidence that the *Accademia Segreta* ever existed but it was probably founded in the early 1640s when Ruscelli moved to Naples. According to Ruscelli, the aim of the academy was “to make the most diligent inquiries and, as it were, a true anatomy of the things and operations of Nature itself.” Even though the activity of Ruscelli’s group was meant to be kept secret, the members devoted themselves “equally to the benefit of the world in general and in particular, by reducing to certainty and true knowledge so many most useful and important secrets of all kinds for all sorts of people, be they rich or poor, learned or ignorant, male or female, young or old.” The *Secreti nuovi* contains 1,245 recipes that Ruscelli claims were only a fraction of the “experiments” carried out within the academy. Most of them dealt with medicine, the others ranged from alchemical processes and cosmetics to various technical recipes.

A similar academy, the *Accademia Secretorum Naturae*, was founded by Giambattista della Porta (► [della Porta, Giambattista](#)) at his home in Naples in the 1650s. As William Eamon pointed out, “the nearly identical names of the two academies, their proximity in time and place, and the similarity of their experimental methodologies, was surely no coincidence.” Della Porta only mentioned the academy in the preface to the second edition of his *Magia Naturalis* (1589), which

largely consists of a vast collection of recipes and experiments ranging from medicine to optics, from crafts to distillation. At least two artisans, the distiller Giambattista Melfi and the herbalist Flavio Giordano, were involved in the academy’s activity. Nevertheless, not much is known about the *Accademia dei Segreti*, probably also because of Della Porta’s concerns with secrecy.

Mainly inspired by Della Porta’s work as well as by Paracelsian philosophy and by the encyclopedism of the late sixteenth century is the foundation of what is probably the most renowned scientific academy of the Renaissance, the *Accademia dei Lincei*. The academy was created in Rome in 1603 by the young nobleman Federico Cesi (► [Cesi, Federico Angelo](#)) with the help of the mathematician Francesco Stelluti, of the Dutch physician Johannes van Heeck, and of his relative Count Anastasio De Filiis, a scholar in mechanics. Not unlike many other Renaissance academies, the Linceans had an emblem (the lynx) and a motto (*Sagacius ista*). A set of rules similar to those found in religious or chivalric orders defined the selection criteria for new applicants as well as the ideals and lifestyle to which the members would have to conform.

The *Lynceographum* (2001), which Cesi began in 1605, regulated every aspect of the Linceans’ life and called for a radical reform of learning and customs. The academy was initially designed as a sort of lay confraternity in which scientific activity was driven by religious enthusiasm. Every work published by one of its members had to display the title “Lincean” next to the name of the author; moreover, members were forbidden to belong to any religious order and to discuss matters connected with politics or religion. Cesi put forward a model of knowledge in which a disinterested form of knowledge contrasted with the “bookish” learning of the schools as well as with courtly worldliness. In his project, explained in the *Discorso del natural desiderio di sapere* (1616), the study of nature is articulated into observation and experimentation. However, this emphasis on the value of direct observation of nature and of experimental practice, which became even stronger in 1611 when Galileo joined the academy, was often relegated to a theoretical level rather than being adopted as a real

research model. The academy was in fact more an ideal community of scholars than a place for regular meetings. The exchange between members mainly took place in written form, through their correspondence, and the irregular academic sessions took mostly the shape of “lectures,” presentations of new works, discussions, and speeches. The Lincean experience, which ceased to exist after Cesi’s death in 1630, was therefore essentially another expression of the traditional communicative patterns of the Renaissance academic model.

Impact and Legacy

Throughout the Renaissance, observation and experiments remained mostly a moment of private investigation that did not belong to the academic sessions in which the results were presented and discussed. It is only around the second half of the seventeenth century that academies finally leave behind the project of an all-encompassing type of learning and the model of erudite conversation and become a place in which experiments are designed, refined, and then communicated through the means of a printed publication.

The Accademia del Cimento, founded in Florence in 1657 by Prince Leopoldo de Medici, is probably the first academy of this kind, though it lacked a formal charter and official rules. The experience of this academy, followed by the long-lasting and more renowned ones of the Royal Society in London (1662) and of the Académie Royale des Sciences in Paris (1666), opened a new institutional phase. Academies thus ceased to be an almost exclusively Italian phenomenon and gradually became a locus of production and dissemination of technical and scientific learning, thus also opening up to new knowledge challenges and institutional forms.

Scotism

Thomas Jeschke

Faculty of Arts and Humanities, Thomas-Institut,
University of Cologne, Cologne, Germany

Abstract

Scotism is a current or school of thought which is linked to the positions that the Franciscan John Duns Scotus taught in Paris. Unlike Thomism, Scotism was not a school in the strict sense (at least not until the sixteenth and seventeenth centuries); instead, the term was commonly used to describe philosophers who adopted Scotus's way of doing philosophy and theology. Scotism did not play an important role in Renaissance philosophy, with one exception: the University of Padua, which continued the medieval tradition of Scotism. Nevertheless, Scotus and Scotist positions were well regarded and made use of from time to time in Renaissance philosophy.

Although Scotism, unlike Thomism, was mainly characterized by its methodological approach to philosophy and theology, some key doctrines can nevertheless be identified: above all, Scotus's formal distinction and his theory of grades (on both of which, see below). These doctrines, in particular, have been used over many centuries to identify Scotism, Scotist positions, and Scotists. There are, however, other doctrines which also characterized Scotist thought, such as the theory of the univocity of being, the concept of *haecceitas* (by which something is individualized), and the form of corporeity.

Heritage and Rupture with the Tradition

"Scotism" as a name or attribute seems to have been coined in the Baroque era; yet as early as the 1320s, one finds authors describing themselves as *scotiçantes* (Knebel 1995). Scotists were also called *formalistae*, which indicates that Scotism was more about applying a specific method than about following Scotus or the set of doctrines associated with him. It is, therefore, correct to say that, in Scotism, it was the method that produced the school, whereas, in Thomism, it was the school that produced the method (Hoenen 1998).

Although it is common to speak of "schools" at the end of the thirteenth and the beginning of the fourteenth centuries – for instance, the "early Thomist" or "early Scotistic school" – these loose groupings disappeared after the 1330s (Hoenen 1997). They reappeared, however, in the fifteenth century, but in a new context, that of universities. The new lines of division were "via antiqua vs. moderna," "reales vs. nominales," etc. Interestingly, Scotism – together with Thomism and Albertism – belonged to the "old way" (*via antiqua*) and the realistic approach (*reales*), while the "new way" or nominalist approach was closely linked to another Franciscan, William of Ockham.

Unlike Thomism, Scotism was rarely institutionalized, but instead operated as a "sheer conceptual force" (Hoenen 1998, p. 199). What this means is that individual authors, whether or not they were Franciscans, defended Scotus's positions rather than following the doctrine of a particular order. In fifteenth-century Cologne, for instance, Scotism, unlike Thomism and Albertism, was not institutionally grounded. A difficulty for the Franciscan Order was that it had two "stars": Scotus and Ockham. It was only later, when the order attempted to downplay Ockham's importance (as a corrupter of "synthetic scholasticism"), that it explicitly promoted Duns Scotus (Roest 2000, p. 185).

A defining feature of Scotists was their method (*processus*), which was set out in its so-called *regulae*. A table attached to a later edition of Francis of Mayronnes's commentary on the *Sentences* of Peter Lombard lists 139 rules which Scotists followed (Hoenen 1998, p. 207).

In the sixteenth and especially the seventeenth century, Scotism finally became an influential force. Many books (commentaries on Aristotelian works, as well as courses in theology and philosophy) *ad mentem Scoti* were printed (Schmitt 1978, p. 306; Edwards 2009). Scotist course textbooks such as those of Bartholomew Mastrius (de Meldola) († 1673) and Bonaventura Belluti († 1678) (Mastrius and Belluti 1727), and Theodor Smising († 1626) (Smising 1627) were published, and primers of Scotus's philosophy and theology also appeared in early printed editions: for instance in William Gorris's *Scotus pauperum* (Gorris 1492) or Mathurin Le Bret's *Scotus parvus* (Mathurin Le Bret 1528/29) (Schmutz 2002). Starting in 1639, Luke Wadding († 1657) and John Punch (Poncius) († 1661) published their edition of Scotus's *Opera omnia*, which remained the most important edition for centuries and which even nowadays is a point of reference. In the late fifteenth and early sixteenth century, Scotist chairs were established in Alcalá, Paris, Oxford, Cambridge, Padua, Toulouse, Cracow, Coimbra, and Salamanca, thus institutionalizing Scotism in the most important universities in Europe. This is the context in which the famous statement of Juan Caramuel y Lobkowitz (1606–1682) that the Scotist school is far more numerous than the others put together (“Scoti schola numerosior est aliis simul sumptis”) should be understood (Bak 1956; Edwards 2009; Schmutz 2002; also Schmutz 2016). Nevertheless, contrary to Lobkowitz's view, Scotism at the time was not, in fact, numerically the largest school, though it was among the most influential ones. Roger Ariew speaks of the “ubiquity of Scotism in the Latin and vernacular textbook culture” (Ariew 2000) and therefore assumes that Scotism even exerted influence on Descartes. Other scholars have identified a “Scotist Bodin” or “Scotist Pico” (Schmutz 2002, p. 68). The pivotal figures in the transmission of Scotist thought, however, were the Jesuits Francisco Suárez († 1617) and Gabriel Vázquez († 1604) and, above all, the Cistercian Eustache de Saint-Paul († 1640), for whom a key issue was the difference between *esse objective* and *esse cognitum* as defended by Scotus and Peter Auriol (Schmutz 2002).

Innovative and Original Aspects

Although Scotism is primarily defined by its methodological approach, nonetheless certain central doctrines, strongly connected to this approach, can be identified. Notably important are two doctrines which, throughout the centuries, have served to mark Scotist positions: Scotus's formal distinction and his theory of grades (Hoenen 1998). Scotus makes use of a formal distinction whenever he does not want to assume either a real distinction or a merely conceptual one: for example, the distinction between the persons of the Trinity and the divine essence, or between the soul and its powers. Even the difference between the common nature of a thing and its individual difference is described in terms of a formal distinction. While Scotus's terminology with regard to individuation is not consistent (he first assumes a form of individuation, then later an individual grade, and scarcely uses the term *haecceitas*), most Scotists interpreted Scotus as saying that the principle of individuation was a grade or even an intrinsic mode (e.g., William of Alnwick, Francis of Myrnonnes; see Dumont 1995, p. 217). Other doctrines that further characterize Scotist thought follow from these two main assumptions. One such doctrine is the theory of the univocity of being: the view that being is predicated of God and his creation not analogically (as the Thomist tradition has it) but univocally, so that the difference between God and His creation is only “one of degree” (Cross 1999, p. 39; Williams 2016). Another is the concept of *haecceitas*, which is used as an alternative description of individuation: “haecceity” is what renders the common nature individual. Finally, Scotus argues for at least two substantial forms in man: one is the human soul, which has powers formally distinct from the soul's essence; the other is a form of corporeity, which is responsible for the shape of the body (Duba 2012).

Impact and Legacy

Scotism was a major force in Paris during the late fifteenth and early sixteenth century (see the list

below) and, next to Thomism, “the only other major theological influence in Italy” (Monfasani 1993, p. 270). It was also strong in German universities such as Freiburg or Tübingen (Zahnd 2014, esp. pp. 449–491; Bolliger 2003). In Freiburg, the *via moderna* was even for a time called the *via Scoti*.

The University of Padua played a central role in Renaissance Scotism, in that “the Paduan school, along with several others, forms a continuity with the medieval Scotism” (Schmitt 1978, p. 306). In 1474, a Scotist chair in metaphysics was established, followed 2 years later by another in Scotist theology. In 1490, Thomist chairs of metaphysics and theology were also established. All four of these chairs persisted until the eighteenth century. Professors of Scotist and Thomist metaphysics and theology were called “concurrents,” lecturing at the same time on the same day. Nevertheless, their competition was entirely professional and carried out in a friendly atmosphere (Gaetano 2013). Antonio Trombetta and Maurice O’Fihely were the most outstanding Scotists of the end of fifteenth century. Trombetta disputed with his Thomist “concurrent” Francesco Securo di Nardò; Trombetta opposed Nardò’s Thomism, as well as Averroes’s doctrine of the unity of the intellect and even denied Scotus’s idea that human reason could demonstrate the immortality of the soul. O’Fihely took a philological approach to Scotus by producing editions, including texts relevant to the Franciscan tradition (Mahoney 1978, pp. 217–218). Apart from the institutionalized Scotism in Padua, many other Renaissance philosophers picked up ideas from Scotus and integrated them into their own philosophy: for instance, Nicoletto Vernia, Agostino Nifo, and Pietro Pomponazzi. In addition, Marcantonio Zimara tried to come to the best philosophical positions by making use of (almost) all the different school traditions, including Scotism.

The success of Scotism in Padua is all the more surprising given the problems which had to be overcome (di Napoli 1978, p. 265). First, Scotus did not hand down a consistent or systematic presentation of his work (Pini 2010), already in the fifteenth century O’Fihely complained about the “chaos metaphysicale Scoticum” (cf. Duns

Scotus 1891, p. 429a). Second, Scotism stood in opposition to all the major currents of thought: Aristotelianism, Thomism, and Ockhamism. Third, Franciscans, who might have been Scotus’s “natural followers,” had to choose between him and Ockham, whereas the Dominicans, in general, followed the doctrine of Thomas Aquinas.

Other philosophers and theologians who have been labeled “Scotists” include (Roßmann 1989):

Early Scotists: Henry of Harclay († 1317), Antonius Andreae (= Scotellus) († 1320), Hugh of Novocastro († 1322), Anfredus Gonteri († ca. 1325), Francis of Mayronis († after 1326), William of Alnwick († ca. 1333), Francis of Marchia († ca. 1344), John of Reading († 1346), John of Bassolis († 1347), and Landolfo Caraccioli († 1351).

Scotists of the second half of the fourteenth century: Walter Burley († 1344/45), Thomas Bradwardine († 1349), Peter Thomae († 1350), Peter of Aquila (= Scotellus) († 1361), Andreas of Novocastro († ca. 1400), and Peter of Candia († 1410).

Scotists of the fifteenth century (mostly commentators on Scotus’s works): William of Vaurouillon († 1463), Nicholas of Orbellis, Stephen Brulefer († c. 1497), Pelbart of Temesvar († 1504), Paul Scriptoris (1505), Gratian of Brescia († 1505), Peter Tartaretus († 1509/13), and Antonio Trombetta († 1517).

Later Scotists: Francis Lachetus († 1520), Claudius Frassen († 1711), Hieronymus de Montefortino († 1738), Aodh Mac Cathmhaoil (Hugo Cavellus) († 1626), Parthenius Minges († 1926), and Déodat de Basly († 1937).

Sculpture, Renaissance

Elena Vaiani

Independent Scholar, Pisa, Italy

Abstract

Sculpture in the Renaissance was renewed by the study of ancient art, taken as a universal model of perfection. This led to a different representation of the human figure in comparison to Gothic and medieval art. Florence witnessed the beginning of the new style through the works of Ghiberti and Brunelleschi. The most important artists of the Renaissance were Donatello and Michelangelo. Michelangelo's style in sculpture was, in turn, the model for the Mannerists, who, toward the second half of the sixteenth century, were active throughout Europe.

Innovative and Original Aspects

From the fifteenth century, a crucial change took place in Italian culture: The intellectual movement we now call humanism rediscovered, through critical studies, the classical past. As well as ancient literature, classical art became a model for the present: the beauty of Greek and Roman works of art – known both through texts such as Pliny's *Natural History* and ancient ruins and statues which were studied and reproduced in drawings by artists – was a universal ideal of perfection (Haskell et al. 1981; Bober et al. 1986). It was through sculpture that this new ideal first permeated the arts: together with a new conception of space and the use of perspective, ancient models renewed the figurative culture of Europe. The beginning of Renaissance sculpture dates back to 1401 in Florence, with the competition for the north door of the baptistery of the cathedral, won by Lorenzo Ghiberti. One of Ghiberti's rivals was Filippo Brunelleschi, whose bronze panel with the *Sacrifice of Isaac* is a dramatic scene in which figures move freely in the space and seem to go toward the spectator. This conception of space

marked a significant divergence from Gothic art. Ghiberti represented the space clearly in perspective in his second set of doors, the *Gates of Paradise* (1425–1452), and produced the first life-sized bronze statue since antiquity, *St. John the Baptist* (1412–1416) for Orsanmichele, the church of Florentine guilds. The decoration of the church, made by many artists, was an extraordinary compendium of the transition from late medieval to Renaissance sculpture. The most important artist working on Orsanmichele was Donatello, author of the marble statue of *St. George*, which reveals his deep study of the human figure at rest, modeled on ancient statues (Avery 1970, p. 33–69). In his bronze *David* (1440–3, Bargello, Florence, Fig. 1), a defining

sculpture of the Renaissance, a biblical subject is represented like an ancient statue, with classical nudity and a *contrapposto* stance, but also with a strong vitality in the figure's expression and pose (Caglioti 2000). Donatello's *Gattamelata* in Padua (Fig. 2) was the first equestrian statue since antiquity, inspired by ancient bronzes such as the Marcus Aurelius in Rome and the Horses of San Marco in Venice (Pope-Hennessy 1958, p. 64–65). Other important sculptors were Nanni di Banco (Florence) and Jacopo della Quercia (Siena), author of the Fonte Gaia (1414–1419) in the Piazza del Campo (Bloch 2020). During the early Quattrocento, it was also developed the art of small bronzes, so popular in antiquity, with subjects taken mainly from ancient mythology. All the major artists of the Renaissance produced small bronzes: Among the most popular was Agostino Riccio in Padua, and one of the masterpieces is the *Hercules and Antaeus* by Antonio Pollaiuolo (c. 1475; Bargello) (Pope-Hennessy 1958, p. 99–106).

The master of the early-sixteenth-century sculpture was Michelangelo Buonarroti, who was also a painter and architect. Among his earliest works are a *Bacchus* (1496–7, Bargello, Fig. 3), sculpted in Rome, in which Michelangelo recreates the ideal of an ancient statue, and the

Pietà (St. Peter's). A few years later, Michelangelo's *David* (1501, Fig. 4) became one of the symbols of Florence: a monumental statue of the greatest harmony and balance, representing the self-confidence and calm of a hero with a weapon in his hand. Other masterpieces were sculpted for sepulchral monuments: In Rome (1506–1516), Michelangelo sculpted the celebrated *Moses* for Julius II's tomb, and in 1520–1534 he executed the Medici tombs in Florence, with the four personifications of *Night*, *Day*, *Dawn*, and *Dusk*. His final work was the unfinished *Rondanini pietà* (1552–1564, Castello Sforzesco, Milan): in this group, he uses more delicate and elongated forms, in contrast with the strength and power of the body of Christ in the first *Pietà* of the Vatican (Avery 1970, p. 168–193; Steinberg 2018.)

Impact and Legacy

Renaissance art spread all over Italy and Europe. The art of late sixteenth-century Europe is called "Mannerism," the art in the "maniera" ("style") of the greatest artist of the Renaissance; the model for sculptors was Michelangelo. Among his followers in Florence were Baccio Bandinelli, whose

Hercules and Cacus (1534) was placed as a companion to the *David* in front of the Palazzo Vecchio, and Bartolommeo Ammannati, author of the Neptune Fountain (1560–1575) in the Piazza della Signoria. Benvenuto Cellini worked in Rome, France, and Florence, where he executed the *Perseus* (1545, Loggia dei Lanzi, Florence). In the same town settled the Flemish artist Giambologna (*Rape of the Sabines* 1579–1583 Loggia dei Lanzi). Examples of Mannerism are also found in Northern European countries (Low Countries, Germany, and France), as well as in Spain (Raymond et al. 2015).

Scuola di Rialto

Nicolò Cristante

Department of Philosophy and Cultural Heritage,
Ca' Foscari University of Venice,
Venice, Italy

Abstract

The Scuola di Rialto was a learning and cultural center active in Venice between the fifteenth and seventeenth centuries. Established as a place devoted to the study of Aristotelian and natural philosophy, it develops, over time, the teaching of theology and of all the subjects characterizing the traditional Faculties of Arts.

Innovative and Original Aspects

The Scuola di Rialto has its foundation, thanks to a bequest (agreed in 1397) of the Venetian patrician Tommaso Talenti including a salary of 50 ducats for a lecturer of renowned scientific authority to teach logic and philosophy in the city of Venice. The legacy becomes *de facto* operational at the death of the patron in 1403 (Nardi 1971, p. 14). A peculiarity, which the Scuola will maintain all over its history, is its being composed of one lecturer, who is the only responsible for all its activities (Grendler 2002, p. 138).

The first period of the Scuola is marked by a succession of lecturers who graduated in Padua and were influenced by the work of the famous philosopher Paolo Veneto (Lepori 1980, p. 540). This short tradition reaches its highest fulfilment with the teaching of the man who can be considered the most significant lecturer of the Scuola di Rialto: Paolo della Pergola. He conducts his duty between 1421 and 1454. His teaching is primarily based on logic. On the one hand, he focuses on the analysis of Occamistic nominalism and the Oxoian tradition. This is witnessed by his major works: *Compendium logicae*, *De sensu composito et diviso*, and the *Dubia super Consequentiiis Strodi*. On the other hand, it must be remarked

that a fundamental component of his work in Venice is the teaching of the Averroistic Aristotelianism (Lepori 1980, p. 555).

Paolo della Pergola operates many relevant improvements in the Scuola di Rialto, extending its educational offer and trying an institutional development. He does not restrict himself to the original task of delivering lectures focused on logic and natural philosophy – as established during the foundation of the Scuola. He develops, instead, the teaching of theology, moral philosophy, metaphysics, and many of the disciplines taught at the Faculty of Arts of Padua. Under his influence, the Scuola is also promoted by the Venetian government into a public educational institution, with the subsequent establishment of stable public funding, meant to cover its maintenance costs. Nevertheless, the main desire of Della Pergola is the complete transformation of the Scuola into a University. This project is opposed by the Republic and will never see its realization. The government of Venice had indeed previously decided that only Padua should be the University of the Republic and that there would be no room for another institution aiming to place itself as a competitor (Nardi 1971, pp. 49–51). This decision will never be considered as acceptable by Paolo della Pergola: a man who does not belong to the Venetian aristocracy and, consequently, is unaccustomed to the dynamics of the Serenissima's policies.

An interesting and not well-known aspect of the teaching of Paolo della Pergola is the study of the Scotist tradition; this is deepened by his successor Domenico Bragadin – who leads the Scuola di Rialto between 1454 and 1479. This approach is witnessed by an unpublished work, entitled *De Mortalium felicitate* and written by Nicolò da Catarro (1461–1462 cf. Lepori 1980, p. 559), but its influence on the Scuola is nevertheless not clear.

During the teaching of Antonio Corner, from 1479 to 1498, coinciding with the maximum development of Venetian humanism, several profound changes happen within the Scuola di Rialto. Most visible, the study of logic loses its preponderance in favor of a more open approach to the variegated cultural fields of the humanities; the same is applied to Aristotelianism, which

starts following an eclectic approach and becomes less regimented in a given model of interpretation (Lepori 1980, pp. 586, 587). Worthy of remark is a pupil of Corner, Francesco Bragadin, lecturer in Rialto after his mentor, who, starting from this context of openness, introduces in the Scuola some elements taken from Platonism and consequently incentivizes the study of theological and metaphysical disciplines.

A few years later, the Scuola di Rialto is driven in a different direction by Sebastiano Foscarini, who is considered one of the most important heads in the history of this institution. A Venetian patrician, Foscarini, called in 1505 to continue the work of Antonio Giustinian, remains in the Scuola until 1552. He is also very involved in the city's political life, and for this reason, he suspends his lectures for several periods. Foscarini's philosophical target is characterized by the restoration of the Averroistic Aristotelian and the aim of renewing the original *rioaltina* tradition (Lepori 1980, pp. 596–597). Other than this, the deficiency of sources does not allow to define a reliable framework of his project.

At the antipode of Foscarini's Averroism, there is the lecturing of Agostino Valier. Considering philosophy as the most appropriate form to express his multiform interests (Cipriani 2008, p. 25), he guides the Scuola di Rialto in the second half of the sixteenth century toward a new spirit, inclined in the direction of a possible correlation of Plato and Aristotle (Santinello 1991, p. 126), compatibilism, which takes Bragadins' previous attempt to a more radical and definite extent. During his years in Venice, Valier is influenced by the humanistic doctrines of Marsilio Ficino and Lorenzo il Magnifico, to the extent that his research is oriented toward the refusal of the idea of a radical break between paganism and Christianity (Negruzzo 2015, p. 262).

In its long activity, the Scuola di Rialto remains, together with the Scuola di S. Marco, the most accomplished attempt of realizing a center of education and research within Venetian humanism.

Scutelli da Trento, Nicola

► [Scutellius Tridentinus, Nicolaus](#)

Scutellius Tridentinus, Nicolaus

Born: 1490, Trent, Italy

Died: 1542, Trent, Italy

Pier Davide Accendere
Humanities Department, University of Eastern
Piedmont “Amedeo Avogadro”, Vercelli, Italy

Abstract

Nicolaus Scutellius of Trent (1490–1542), an Augustinian friar and *protégé* of Giles of Viterbo (1469–1532), as well as a prominent Hellenist and translator of Greek Neoplatonic writings into Latin, is notable for his passionate participation in Renaissance controversies about Plato and Aristotle. In modern scholarly

literature, the only discussion of the life and works of this almost unknown and rather marginal figure in the history of European thought are found in the studies of John Monfasani.

Alternative Names

Scutelli da Trento, Nicola; Pseudo-Pletho

Biography

Nicolaus Scutellius was born in Trent (Italy) in 1490. In 1512, he became an assistant to Giles of Viterbo, a major humanist and General of the Augustinian Order (see Monfasani 2007). Scutellius “spent some time in various *studia* of the Order in the 1510s, but in the 1510s and 1520s he was mainly in Rome with Giles” (Monfasani 2005: 3). In 1513 and 1514, Scutellius worked in Rome as a scribe of Giles’s registers. In 1515, he moved to Siena to study, and in 1518 he received a Bachelor’s degree in Theology. He completed his Latin translation of Proclus’s *Theologia Platonica* in 1520 and of Proclus’s commentary on *Parmenides* in 1521. The following year, he became regent at the monastery of S. Agostino in Rome. During 1526 and 1527, he dedicated some of his major translations to Giles of Viterbo, including his Latin versions of Pletho’s commentary on the *Oracula Chaldaica* (*Zoroastri*) (1526) and the *Tabula* of the *Theologia Grecorum* and the collection of the *Fragmenta Orphica* (January and March 1527). Scutellius also produced Latin translations of the following important texts: Iamblichus’s *De mysteriis Aegyptorum* and *Vita Pythagorae*; Proclus’s commentaries on Plato’s *Republic* and part of *Alcibiades I*; a collection of extracts from Proclus’s *Theologia Platonica* known as “Le Grand Fragment”; Porphyry’s *Sententiae*; Albinus’s *Didascalicos*; and George Gemistus Pletho’s *Laws* (*Leges*). His versions of Pletho’s writings are particularly significant; as Monfasani points out, “Scutellius made the first known Latin translations of Pletho’s *Laws* and his commentary on the *Oracula Chaldaica*. Scutellius, in fact, translated the latter text from

a Greek manuscript, now in Dresden, that Giles himself had transcribed with his own hand years earlier” (Monfasani 2005: 5).

Scutellius’s interest in Pletho is evidenced by his treatise *Pletho in Aristotelem*, written under the pseudonym “Pletho” between the early 1520s and early 1530s. The work was discovered in 1990 by Monfasani and is not a mere translation of Pletho’s *De differentiis*, but an original philosophical treatise. Moreover, according to Monfasani, this work “is an important text for several reasons. First of all, it is powerful proof of how much the Augustinian Platonists around Giles of Viterbo took to heart the fifteenth-century Plato-Aristotle controversy” and, as such, it stands out as “a major piece of evidence for the interests and activity of a distinct group of Italian Platonists in the 1520s. Second, *Pletho in Aristotelem* is the only sizeable original philosophical document we have from the most competent Hellenist and Neoplatonic scholar in the circle of Giles of Viterbo” (Monfasani 2005: 15–16).

After Giles’ death (1532), Scutellius returned to northern Italy. He died in Trent in 1542 (Monfasani 2006: 332–333).

Scutellius’s Translations

List from Monfasani (2006: 333–334):

1. Iamblichus, *Mysteria Aegyptorum*, printed in Rome in 1556 and extant in several MSS.
2. Iamblichus, *Vita Pythagorae*, printed in Rome in 1556 and extant in several MSS.
3. Pseudo-Plato, *De Iusto*, in MS Napoli, BN, V. F. 5.
4. George Gemistus Pletho, *In Oracula Zoroastri*, in MS Napoli, BN, II. F. 7, ff. 191v–195r, dated Palm Sunday, 1526.
5. George Gemistus Pletho, *Leges*, (partial), in MS BAV, Vat. Lat. 6320, ff. 161r–174r.
6. Collection of *Orphica*, MS Napoli, in BN, II. F. 7, ff. 4r–71v, with a preface dated 3 Non. Mar. 1527; and miscellaneous *theologia prisca* BAV, Vat. Lat. 6320, ff. 49r–122v.

7. Proclus, *Theologia Platonica*, in MS Napoli, BN, VIII. F. 7, ff. 37r–299r, with the colophon “Hanc feturam Viterbium peperit. MDXX Urbs Roma partum solvi.”
8. Proclus, *In Platonis Rempubicam* (partial, to the end of the twelfth dissertation, ed. Kroll, II, p. 296.16), in MS Napoli, BN, II. F. 7, ff. 74r–184r, dated 20 April 1526.
9. Proclus, *In Platonis Parmenidem*, in MS Firenze, Bibl. Riccardiana, 155, ff. 4r–426v; Wien, NB, Lat. 10056, ff. 24v–236v.
10. Proclus, *In Alcibiadem I* (partial; up to 72.7; = tr. Ficini., *Opera Omnia*, Basileae 1576, pp. 1908–1912, last line), in MS Firenze, Bibl. Riccardiana, 155, ff. 427r–459r; Wien, NB, 10056, ff. 223r–250v.
11. Porphyry, *Ansa* (= *Sententiae ad Intelligibilia Ducentes*), dated 6 October 1526, in BAV Barb. Lat. 322, ff. 133r–144r, copied by Luca Holstenus from a MS in Theatines’ library in Naples; Napoli, BN, II. F. 7, ff. 210r–227r.
12. Unidentified texts of Gregory of Nyssa, lost; see Seripando, *Registrum Generalatus*, II, p. 172.
13. Lucian, *Dialogus VII Mortuorum*, preface dated Rome, Id. February 1533, in Wien, NB, Lat. 10056, ff. 251v–252r, but the translation is no longer extant.
14. Four hymns in Homer to Venus, Minerva, Juno, the Muses and Apollo, in Wien, NB, Lat. 10056, f. 252r–v.
15. Extracts from various authors in alphabetical order, in MS BAV, Vat. Lat. 6320, ff. 185r–309v.
16. Albinus, *Didascalicos*, MS Napoli, BN, VIII. F. 7, ff. 425v–428r.

Seed Concept in the Renaissance

Hiro Hirai

Center for the History of Philosophy and Science,
Radboud University Nijmegen, Nijmegen,
The Netherlands

Abstract

In Renaissance and early modern “chymistry” (alchemy/chemistry) and biomedical sciences, ideas derived from “seeds” (*semina*) were frequently used: “seeds of things” (*semina rerum*), “seeds of reasons” (*semina rationum*), “seminal reasons” (*rationes seminales*), “seminary” (*seminarium*), and “seminal principle” (*principium seminale*). These notions can be grouped together under the name of the “concept of seeds.” Widely diffused under the authority of the “Platonists,” this concept aimed to explain the formation and organization of natural bodies and even the origin of their forms in matter. It first took shape in the cosmological metaphysics of Marsilio Ficino (1433–1499) and then was developed by physician philosophers such as Jean Fernel (1497–1558), Paracelsus (1593/1594–1541), and Petrus Severinus (1540/1542–1602) during the sixteenth century. It was finally reinterpreted in a corpuscular perspective, culminating in the notion of “molecule” (*molecula*) as the “seeds of things” (*semina rerum*) by French atomist Pierre Gassendi (1592–1655). The concept of seeds can be

regarded as a missing link in the chain which bridged between the medieval scholastic doctrine of substantial forms and the mechanistic corpuscular theories of the late seventeenth and eighteenth centuries. Closely connected to Renaissance chymical philosophy, it played a significant role in the rise of early modern science.

Synonyms

Concept of seeds; *Semina*; Seminal principle; Seminal reason; Seminal reason principle

Innovative and Original Aspects

In his philosophical works, Marsilio Ficino adopted various terms derived from the seed so as to designate the formative cause in the sensible world: “seeds of reasons” (*semina rationum*), “seminal reasons” (*rationes seminales*), “seminary” (*seminarium*), and “seminary reason of the world” (*ratio seminaria mundi*).

Following Neoplatonists such as Plotinus and Proclus, Ficino elaborated the theory of hypostatical substances in his interpretation of Plato’s works (Allen 1982). According to the version developed in his *Commentary* on Plato’s *Symposium* (written before 1482), the divine “mind” (*mens*) derives from the good, which is the pre-eminent being of God, in the concentric metaphysical universe. It is followed by the “soul” (*anima*) of the universe, then “nature” (*natura*), and finally “matter” (*materia*). Nature is an intermediate hierarchy between the soul and matter. Ficino attributes “divine species” (*species divinae*) to each of these five hypostases: “ideas” (*ideae*) to the mind, “reasons” (*rationes*) to the soul, “seeds” (*semina*) to nature, and “forms” (*formae*) to matter. Ideas turn around God and connect Him with the mind. Reasons gravitate around the mind and communicate it with the World-Soul. Seeds revolve around the soul and link it to nature. Finally forms turn around nature and make the bridge between nature and matter. Forms in matter are the ultimate vestiges of the

divine species, all of which are incorporeal and spiritual. Thus seeds share the same source with superior species (ideas and reasons) and inferior species (forms). Beauty, regarded as the ray emanating from God, embellishes the divine mind with ideas, fills the soul with reasons, impregnates nature with seeds, and dresses matter with forms (Ficino 1956).

Ficino further identified nature with the “power of generation” (*potentia generandi*). He also qualified as “seminary” or “seedbed” (*seminarium*) the vivifying power, which is diffused in the whole world. Comparing the emanation of these hypostases with the sun’s rays, Ficino connected nature with “heat” (*calor*), which is responsible for the generation of bodies. Generation is linked to a biological notion of fertility. This fecundity is introduced into nature through the invisible ray of the World-Soul, which conveys the spiritual seeds. Ficino thus incorporated the concept of seeds as the integral part of his metaphysical universe. For him, these invisible and spiritual seeds are the vestiges of forms, which were introduced in formless matter so as to generate diverse beings in the sensible world (Ficino 1956).

In his masterpiece, *Platonic Theology* (*Theologia Platonica*) (Florence 1482), Ficino even went further by combining the Thomistic doctrine of substantial forms to his concept of seeds. According to him, nature encloses the invisible and spiritual seeds, endowed with the power to extract the substantial forms of the elements from the depth of matter. These seeds are superior to the elemental forms, and under their control, the elemental qualities bring about properties such as colors in natural things. Ficino’s seeds were, therefore, able to make Aristotelian physics subordinate to Platonic metaphysics and are not identical with the seminal reason principles of the ancients (Stoics, Neoplatonists, and Augustine) (Ficino 2001; Hirai 2002).

Jean Fernel of Paris was the first academic physician to introduce Ficino’s teachings into the foundation of learned medicine. In his major philosophical dialogue, *On the Hidden Causes of Things* (*De abditis rerum causis*) (Paris 1548), calling upon the belief in the “ancient theology” (*prisca theologia*), Fernel established the basis of

his natural and medical philosophy through the harmonization of ancients such as Plato and Aristotle. In doing so, he adopted Ficino's concept of seeds. According to Fernel, the seeds of the forms of natural things were sown by God at the moment of the creation of the world. Now these seeds fall from heaven, being carried by the World-Spirit diffused everywhere in the universe. Fernel connected Ficino's theory of the universal spirit with the Biblical idea of the spirit (breath) sent from God's mouth as is seen in Psalm 32. Fernel thus tried to place his concept of seeds in a Christian perspective (Fernel 2005).

Parallel to Fernel, Paracelsus also contributed much to the elaboration of the concept of seeds. Although he might initially have been inspired by the ideas of Ficino, he radically Christianized its contents. According to him, God sowed the archetypal word "fiat" as the primordial seed of the universe in the creation of the world. This divine seed enclosed within itself the seeds of the four elements (Paracelsus 1922-1933, XIII: 9, 12-13). Paracelsus did not see the elements as the material causes of natural bodies but as their cosmological receptacles, called "mothers" (*mütter*). These matrices contain all natural beings under the form of particular seeds and foster them until their maturation as "fruits" (*früchte*) (Paracelsus III: 32-33). Thus all creatures are born from their own spiritual seeds. Each being in nature lives its biological time and grows toward its definite end according to the "predestination" (*praedestinatio*) which was determined by God. At the time of "harvest," natural things are consumed by human beings as food or medicine (Paracelsus III: 34-35).

In Paracelsus, universal nature is depicted as the divine Sower's enormous bag, which contains the spiritual seeds of all natural beings mixed together. Each seed encloses the three principles (salt, sulfur, and mercury). These are not the natural substances bearing these names but the symbolical denominations based on their functions. They should not be understood as the material causes from an Aristotelian perspective. These three principles in the spiritual seed determine the development (life) of each individual through the intervention of administrator "workers," conceived in the guise of internal alchemists. Paracelsus referred to them as "vulcanus" when they are

in nature and as "archeus" when inside the human body (Paracelsus III: 35 and XI: 187-88).

Under the influence of Ficino, Fernel, and Paracelsus, Petrus Severinus established his unique system, which can be qualified as the "philosophy of seeds." Indeed the concept of seeds occupied the central place of his natural and medical philosophy. In his masterpiece, *The Idea of Philosophical Medicine* (*Idea Medicinae Philosophicae*), he built a synthesis upon the *prisca theologia* belief so as to defend the teachings of Paracelsus. Among his immediate fore-runners besides Paracelsus, he owed much to Fernel although he tried to eclipse the Frenchman's name with that of Paracelsus (Severinus 1571; Shackelford 2004; Hirai 2005).

Severinus's theory of the four elements largely depends on that of Paracelsus. They are not conceived as the material causes of natural bodies but as the cosmological receptacles of all creatures. According to Severinus, God implanted future fruits under the form of invisible and spiritual seeds in these matrices. The elements foster these seeds in their bosom so as to produce their fruits and nourish them. This process is programed according to a determined delay for each individual. The spiritual seeds assure the presence of life's vestige everywhere in the world and guarantee the continuity of natural species. They are the source of all kinds of action in nature since they provide all the properties of sensible things. In Severinus's favorite expression, everything in nature is regulated by the seeds' tide-like ebb and flow.

Severinus placed the "principles of the bodies" (*principia corporum*) in the invisible and spiritual seeds. Identified with Paracelsus's salt, sulfur, and mercury, these principles are subordinated to the seeds' incorporeal components: "reasons" (*rationes*), "knowledge" (*scientia*), and "gifts" (*dona*). These components regulate the flows of the seeds in the world to produce corporeal bodies in the process of generation with the help of inner instrumental agents. Severinus called these agents the "mechanical spirits" (*spiritus mechanici*), the invisible and spiritual workers or craftsmen conceived upon the model of Paracelsus's archeus. They produce individuals thanks to the *scientia* given to the seeds. According to Severinus, the spirits deprived of *scientia* are merely sterile

vapors, while the mechanical spirits endowed with *scientia* are fertile and productive. If they have the *scientia* of the heart, they construct the heart; if they possess the *scientia* of the brain, they build the brain (Severinus 1571; Hirai 2005).

Severinus's work was venerated by many physician philosophers of the turn of the century and exerted a considerable impact on the matter theories of the next generations. His fervent followers included Joseph du Chesne (1546–1609), Oswald Croll (ca. 1560–1608), and Jan Baptista van Helmont (1579–1644). Especially under the influence of du Chesne, the concept of seeds became widespread in the early seventeenth century to explain the generation of living beings (animals and plants) and the formation of nonliving things (stones, minerals, and metals) (Hirai 2005; 2010). Heavily influenced by Severinus in his youth, van Helmont long struggled to establish his own system of the seminal principle. Pierre Gassendi also considerably relied on Severinus's theory for his concept of molecules, identified with the “seeds of things” (*semina rerum*) (Hirai 2003). These figures, whose perspectives seem to diverge, shared the same source for their own concepts of seeds and their respective matter theories. Other prominent figures such as Francis Bacon (1561–1626) came to know this concept developed in the steam of chymical philosophy. Although Daniel Sennert (1572–1637) himself preferred forms and souls to spiritual seeds, Severinus's ideas led him to develop the notion of the “seminal principle” (*principium seminale*), to which the young Robert Boyle (1627–1691) and others were to pay considerable attention in the late seventeenth century (Clericuzio 1990; Anstey 2002; Hirai 2011). Thus the concept of seeds bears witness to the lively impacts exerted by chymical philosophy on the emergence of new matter theories during the scientific revolution.

Segni, Bernardo

Born: 21 February 1504, Florence

Died: 3 April 1558, Florence

David A. Lines

Italian Studies, School of Modern Languages and Cultures, University of Warwick, Coventry, UK

Abstract

Bernardo Segni was a prominent figure in the cultural landscape of Florence and an active participant in the Accademia Fiorentina in the

1540s and 1550s. He published several significant translations of and commentaries on Aristotelian works in the vernacular, attempting to match the sophistication of previous Latin interpretations, on which he heavily relied. He was also an active political figure and penned acute observations on the events of his time (and in particular on the role of Duke Cosimo) in his *Istorie fiorentine*, published only long after his death. He also prepared a translation of Sophocles' *Oedipus*.

Biography

Born into a rich merchant family with interests in the wool and silk industry (his father Lorenzo had also held office, both in the Florentine Republic, occasioned by the expulsion of the Medici, and in the Medicean government after 1530), Bernardo Segni enjoyed a fairly comfortable childhood (biography in Lupo Gentile 1905, 11–34; supplementary details in Lupo Gentile 1903; Ridolfi 1962, 511, n. 1; Baiocchi and Albonico 1994). He may have spent part of his early years in Aquila, involved in one of the branches of the family business, but returned to Florence by 1520. We know little about his education, although he may have studied with Francesco Verino, a professor of philosophy at the University of Pisa (1497–1525) and later (1541) a discussant of the Platonic theory of love in the Florentine Academy. In December 1526 he went to Venice together with Paolo Antonio Soderini, entertaining good relationships among others with Alessandro dei Pazzi, the ambassador of the Florentine Republic. By March 1527 he was in Padua, where he came to know (and possibly study with) Niccolò Leonico Tomeo, formerly a professor of philosophy who had recently taken up private tutoring. By the start of 1528 Segni was back in Florence, where he opposed the Arrabbiati in favor of a more aristocratic form of government. From May to December 1528 he accompanied his father, who had been sent as ambassador to Ferrara, but then returned to Florence. In 1529 and 1530 his father's financial affairs received several setbacks and in 1531 Bernardo married Costanza

Ridolfi, partly to help the family situation through her dowry. The family's finances improved somewhat after the return of the Medici in 1530, but after the death of his mother and father (in 1534 and 1535 respectively) Bernardo sought further economic stability by entering in the favor of the dukes. First under Alessandro and then under Cosimo de' Medici, Bernardo held various offices, both in Florence and in other parts of the Duchy, including Anghiari. He also participated in the Accademia Fiorentina (Rilli 1700; Salvini 1717), where he was invited to give public and private lectures and where he served as consul (appointed 24 September 1542). At the same time, he continued his political service: in December 1546 he was made part of the Senato dei Duecento; between December 1546 and March 1547 he was at the Roman court; until shortly before his death, Duke Cosimo continued to give him political assignments (in Cortona, Volterra, Anghiari, and elsewhere), allowing Segni to pass on a much-improved inheritance to his two surviving sons. He died in April 1558 and was buried in Santo Spirito in Florence.

Impact and Legacy

Bernardo belonged to a lively circle of Florentine youth who had a passion for literature and (at times) Greek; these included Gian Battista Strozzi, Roberto Strozzi, the Antinori family, several members of the Pazzi (especially important is the relationship with Alessandro Pazzi), the Capponi, the Soderini, and Donato Giannotti. He was in close contact with some of the best Hellenists of his time, including Pietro Vettori and Francesco Robortello, and although he was not himself an expert in Greek, he was capable of reading it and making sense of it.

Segni published translations of and commentaries on Aristotle's *Rhetoric and Poetics* (Segni 1549a), *Politics* (Segni 1549b), and *Nicomachean Ethics* (Segni 1550), along with one of *De anima* that appeared posthumously (Segni 1583). He also wrote historical works, notably the *Istorie fiorentine* (Segni 1723a) and the *Vita di Niccolò Capponi* (Segni 1723b) in addition to his own *Ricordanze*.

Although it is his historical works that have caught the eye, Segni's greatest achievement was as an interpreter and disseminator of Aristotle's works in the vernacular (see Ridolfi 1962; Rolandi 1996; Langer 1999; Bionda 2001, 2002a, b, 2014, 2015; Blocker 2008; Lines 2013 and [forthcoming](#)). His publication in 1549–1550 of the four Aristotelian works listed above was the fruit of several years of labor and was the expression of one of the earliest cultural programs to offer a unified perspective of the Philosopher in the Italian language. He availed himself of a number of Latin models (including the commentaries of Donato Acciaiuoli and Jacques Lefèvre d'Étaples, the translations of Leonardo Bruni, Johannes Argyropoulos, and Francesco Robortello, the expertise and insights of Pier Vettori) and was not himself a philosopher or greatly original; nonetheless, he offered an intelligent synthesis of various interpretations that spoke to the cultural climate of Florence in the 1540s. In particular, he offered his fellow members of the Florentine Academy accessible translations and high-level commentary in a way that complemented the approaches of Benedetto Varchi and Giambattista Gelli. His *Ethics* commentary, for instance, makes numerous references to Dante and to Italian historical events (Rolandi 1996; Lines 2013). His commentary on the *Politics* is obsequious toward the Academy's patron, Cosimo I (Toste 2011, 191–195; Lines [forthcoming](#)). Segni's activity, however, must be seen within the context of the interest of other contemporary figures (including Sperone Speroni, Antonio Brucioli, Alessandro Piccolomini, and others) in encouraging the study of philosophy in the *volgare*, which had recently attained new status in Italy after the long debates on the *questione della lingua*.

Also of considerable interest are Segni's historical works: the *Vita di Niccolò Capponi* (Lupo Gentile 1905, 36–47; Montevecchi 2004, 120–144) narrates the life and downfall of Segni's maternal uncle, who was deposed as *gonfaloniere* in Florence in 1529. Its authenticity was questioned (Sanesi 1896), but the attribution now seems secure (Lupo Gentile 1904). The *Istorie fiorentine*, in XV books, were written between 1553 and 1558 and cover both Florentine

and Europe-wide events from 1527 to 1555 (Cavalcanti 1723; Lupo Gentile 1905, 34–85; Fueter 1911, 86–87; Rossi 1941; Ridolfi 1960, 1963; von Albertini 1970, 329–34; Cochrane 1981, 278–82; Grassini 1982; Viroli 1992, 245–47; Baiocchi and Albonico 1994, 679–683; Piquet 2002; Capata 2009). Like the *Vita*, this work was not published until 1723, whereupon the Sacred Congregation in Rome in 1725 prohibited the *Istorie* “donec corrigantur,” in view of the work's unflattering descriptions of some churchmen. The best edition so far is that of 1857, but there is as yet no critical edition. The *Istorie* were dismissed by Lupo Gentile as a highly derivative work, and others have observed their antimedicean sentiment, accompanied by scarce attention for constitutional issues (Baiocchi and Albonico 1994, 681–682) but have been better appreciated by others, particularly von Albertini and Viroli. They are a private expression of Segni's unhappiness with Duke Cosimo, who is very much depicted as an Aristotelian tyrant (Genzano 2004; Lines [forthcoming](#)).

Other works of Segni including the *Ricordanze* and his translation of Sophocles' *Oedipus* (first published in 1778) have received hardly any attention. It would be very helpful to know how these fit into his overall production.

Of fundamental importance for understanding Segni's cultural activity is the climate of the Accademia Fiorentina and the role played within it by Cosimo. All of Segni's works were published by Torrentino, the ducal printer, and they were clearly directed to a public that included that of the Accademia. Although the cultural dynamics within the Accademia are now fairly well understood, several aspects remain unclear, including what its relationship was exactly with scholars such as Vettori and Robortello, who taught at the university.

Sennert, Daniel

Born: 25 November 1572, Breslau, Germany (today: Wrocław, Poland)

Died: 21 July 1637, Wittenberg, Germany

Joel A. Klein

Columbia University, New York, NY, USA

Abstract

Daniel Sennert has aptly been referred to as an “archetypical transitional figure.” Sennert’s experimental atomism had a major influence

on later philosophers such as Robert Boyle and Joachim Jungius, but the Wittenberg professor remained committed to an Aristotelian view of natural philosophy that in large part followed Julius Caesar Scaliger. Sennert's medicine was built upon a Galenist humoral pathology, but he also drew heavily from Paracelsian and otherwise chemical medicine. Likewise, Sennert's corpuscular explanation of the origin of life and generation led to his rejection of spontaneous generation, but he also made a case for the existence of substantial forms and the action of semina or seeds – notions that came to influence Gottfried Wilhelm Leibniz.

Biography

Little is known of Sennert's early life save that he was born in Breslau to a shoemaker, Nikolaus Sennert, and his wife Katharina Hellmann. In 1593 Daniel matriculated at the University of Wittenberg, the institution where he spent practically his entire career, and after taking an M.A. in 1598, he graduated with a doctorate from the medical faculty in 1601. Despite claims of earlier biographers, it is unlikely that Sennert spent 3 years at universities in Frankfurt, Leipzig, and Jena (Lüthy and Newman 2000). Upon the departure of his former professor, Johannes Jessenius (1566–1621) for the royal court at Prague, Sennert was promoted to professor of medicine at Wittenberg, and he held this position until his death during an outbreak of plague in 1637.

Sennert's medical and natural-philosophical works were widely read in the seventeenth century beginning with his *Institutionum medicinae libri V* of 1611. His major natural-philosophical works include *Epitome naturalis scientiae*, a work that was revised several times, and *Hypomnemata physica*, which contains the clearest and most extensive exposition of Sennert's atomism. Nevertheless, it is evident that Sennert had already professed atomism by 1619 in his *De chymicorum*

cum Aristotelicis et Galenicis consensu ac dissensu (Newman 2006).

William Newman has argued that Sennert's atomism incorporated the medieval alchemical corpuscular theory of the *Summa perfectionis* of pseudo-Geber, matter theory derived from Book 4 of Aristotle's *Meteorology*, the neo-Aristotelianism that stemmed from Julius Caesar Scaliger, and finally several Paracelsian notions derived from Andreas Libavius (Newman 2001a, b, 2006). Far from being strictly theoretical or eclectic, however, Sennert's atomism was grounded primarily in the experimental practice of the chemical laboratory and, more particularly, so-called reductions to the pristine state that involved the dissolution of a metal in a strong acid and its eventual precipitation and recovery. Sennert employed such experiments to attack theories of mixture championed by scholastic philosophers following Thomas Aquinas and John Duns Scotus.

Sennert's matter theory also included what historians have dubbed the “negative-empirical principle,” a notion derived largely from earlier Scholastic alchemy in which the end products of analysis could be regarded as foundational principles of nature. For Sennert, chemical analysis revealed the three Paracelsian principles salt, sulfur, and mercury, which he believed were the “prima mixta,” that is, the first mixtures of the peripatetic elements (Newman 2006).

Sennert enlisted his matter theory in his medicine and sought atomist explanations of disease etiology as well as therapy (Stolberg 2003; Klein 2016). Such efforts are especially evident in his explanation of “tartarous” diseases like gout and arthritis as well as his pursuit of a nearly universal medicine (Klein 2015, 2016). Sennert's negative-empirical methodology was embraced by later chemists, including Boyle and many of the followers of Joan Baptista Van Helmont, who ultimately helped to transmit this approach to chemists in the eighteenth century. Likewise, Sennert's experimentalist case for atomism had an especially strong influence on Boyle, who employed the same experiments, but with the

dissimilar goal of demonstrating the mechanical origin of qualities and the nonexistence of substantial forms (Newman 2006).

Senses, Internal

Anna Corrias

History Department, University College London, London, UK

School of Historical and Philosophical Inquiry, The University of Queensland, Brisbane, Australia

Department of Philosophy, University of Toronto, Toronto, ON, Canada

Faculty of Divinity, University of Cambridge, Cambridge, UK

Abstract

The internal senses, which, generally speaking, included common sense, the imagination, the estimative faculty, and memory had a central place in the Renaissance understanding of the workings of the human mind. Understood as perceptual powers which mediated between the subject and the object of knowledge, they were considered essential to organize the sensory perceptions individually received by the five external senses into unified representations. Most authors treated common sense and the estimative faculty as powers of the imagination, which was doubtless the most

important of the internal senses. Memory, as the ability to visualize what is no longer there, was also often considered part of the imagination, and its role become increasingly important, as testified by the central role of mnemonics in conceptions of the human mind.

Innovative and Original Aspects

The internal senses, or internal wits, were understood as perceptual powers which processed and organized the incoming sensory-perception. They were thought to mediate between the body and the soul and to provide the soul with a sort of pre-intellectual awareness of the object of knowledge. Following the anatomical model of Galen (130 AD–210 AD) as it was revisited by leading philosophers of the Middle Ages, including Augustine, Albertus Magnus, Thomas Aquinas, and especially Avicenna (Kemp 1996) Renaissance scholars placed the internal senses in the spirit-filled ventricles of the brain. Even though there was not a conventional version of the theory, its general outline listed four internal senses: 1. common sense (*sensus communis*) of Aristotelian origin, which combined the data individually received by the five external senses into one unified perception; 2. the imagination (*imaginatio*), which acted on two levels, both organizing sensory perceptions into single representations and processing those representations on a prerational level. As the “organizer” and “unifier” of sensory perception, the *imaginatio* was often identified with *sensus communis* (Ficino 1576, 1549; Huarte 1604, 71; Vives 1782–90, III, 327–328; Casini 2013, 149); 3. the estimative power (*vis aestimativa*), which can be safely identified with Avicenna’s *waham*, i.e., a sort of empirical judgment that perceives the intentions in the object of knowledge, as in Avicenna’s celebrated example of the sheep perceiving the intention of the harm in the wolf and fleeing from it (Avicenna 1952, 3031; Black 1993, 2000, 60); and 4. memory (*vis memorativa*), which preserves the images of sensation and cognition.

The *sensus communis* was considered a power bonding the external and the internal dimensions

of knowledge, a primordial attempt to spiritualize the materiality of sense perception as received by the five external senses. Leonardo da Vinci (1452–1519) described it as “the part where all the senses meet” and as “the seat of the soul” (Leonardo 1883, II, 838), to which he gave a specific place in the brain (Summers 1990, 71–90). The most important of the internal senses was, doubtless, the imagination, understood not only as a faculty able to bridge levels of different ontological and epistemological perfection, but also as a forceful transitive power which could affect one’s own body as well as other people’s bodies (Ficino 1987, 202; Cattani ca. 1502, e 6^e-e7^r in Hasse 2007, 123; Giglioni 2011, 46), as in the case of the evil eye or of the pernicious influences of the mother’s imagination on the fetus (Alberti 1755, 193; Paré 1982, 54). The sphere of action of the imagination was so wide that not only it was often identified with the common sense, but also with memory. Marsilio Ficino believed that “the imagination is naturally recollective” (Ficino 1576, 1740), and the Spanish physician Juan Huarte de San Juan (1529–1588) claimed that the imagination and memory “are so united and neere neighboured” that they could be hardly “distinguished or discerned” (Huarte 1604, 54). Just as the imagination, moreover, memory was thought to work on different cognitive levels, reaching as down as the animal and the vegetative life. For example, Ficino claimed that animals and plants follow their inner sense, i.e., the vegetative imagination, in order to get both pleasure and nourishment. Afterward, they “remember” the path followed by their imaginations. In the commentary on Plato’s *Philebus*, he says that the nature of “playful dogs, musical birds, ants” and “even plants...paints and forms the body with artful shapes and with the countless species and variety of colour as if by some conscious art of the inner phantasy” (Ficino 1975, 328–331). The essential connection between imagination and memory is best represented in Giordano Bruno’s art of memory, where images and similitude become the vehicles of recollective thought (Vasoli 1958, 285–198; Mertens 2018, 95–149; Yates 1966, 256–257). In fact, Bruno believed that the imagination could bind thinking (Mertens 2018, 209). The association between the imagination and memory informs the

memory systems designed by other scholars of the time, such as the famous English Paracelsian physician Robert Fludd (1574–1637), but also Charles de Bovelles (1475–1566) and the less famous Johannes Spangerbergius (Rossi 2000, 68–61).

Abstract

The Renaissance witnessed a new philosophical interest in the complex phenomenon of sense-perception which proved to be essential for the development of seventeenth and eighteenth centuries empiricism. Theoretical inquiries into the workings of the senses were mainly concerned with the ways in which the senses respond to reality and with their

cognitive ability, which was assessed according to the degree of truthfulness of the information they provided. Following the Platonic and the Aristotelian tradition, sight and hearing were considered the noblest senses, closer than the others to the immateriality of cognitive knowledge. The Renaissance, however, witnessed also a rehabilitation of the sense of touch, increasingly seen as an essential medium between the soul and the external world.

Innovative and Original Aspects

The Renaissance was a golden age for the development of philosophical inquiries into the epistemology of sense-perception, which paved the way for the full rehabilitation of the senses operated by later philosophers, such as John Locke (1632–1704), George Berkeley (1685–1753), and David Hume (1711–1776). Theoretical inquiries into the workings of the senses were mainly concerned with the ways in which the senses respond to reality and with their cognitive ability, which was assessed according to the degree of truthfulness of the information they provided (Bianchi 1996; Bianchi 2006; Giglioni 2013). Francis Bacon (1561–1626) was one of the most outspoken advocates of the epistemological legitimacy of sense experience. Even though he was aware of the dangers implied by the human tendency to misinterpret sense perception, he believed that the study of natural phenomena must be grounded on senses. In general, the Renaissance understanding of the senses was informed by a time-honored tradition reaching back to Plato and Aristotle, which regarded sight as the highest sense, followed in order by hearing, smell, taste, and touch. Sight was closely associated with thinking and deemed essential for scientific inquiry, which depended upon the observation of the visible properties of nature. This reliability was further assured by the fact that sight worked from a distance and instantaneously. In his *Commentary on Plato's Symposium*, Marsilio Ficino (1433–1499) claims that: “Sight works from farther than hearing and is

able to do instantly what hearing does in time. For we first see the lightning and then we hear the thunder” (Ficino 1987, 78; Corrias 2018, 195). Likewise, for Leonardo da Vinci (1452–1519) sight was “the worthiest sense” (Leonardo da Vinci 1970, I, 53–4) and for Galileo Galilei (1564–1642) it was the “most excellent and noble of the senses” (Galileo Galilei 1957, 255). While sight was thought to be at the service of learning, hearing, which acted directly on the *spiritus* – i.e., the pneumatic substance which was thought to link the body to the soul – was believed to affect the emotional self (Ficino 1576, 1453; Walker 1958, 7). However, there were some authors who considered hearing to be intellectually superior to sight. Among them, Charles de Bovelles (1479–1567) and Girolamo Cardano (1501–1576) stand out for the originality of their arguments, mainly based on the assumption that simplicity is metaphysically superior to “mixture.” Since sounds are absolutely pure, both philosophers claimed that hearing is superior to all other senses that have objects of a compound nature (Cardano 1663, 572; Bovelles 1511, Corrias 2018, 195; Frangenberg 1991, 83). Despite keeping with the previous tradition, which considered sight and hearing to be nobler – as they were the least dependent on the physical presence of their objects – the Renaissance witnessed a rehabilitation of the sense of touch (Giglioni 2013, 18). Touch found a prominent place in the philosophy of Bernardino Telesio (1509–1588), who claimed that sense perception takes place when the *spiritus* becomes aware of the impact of the external objects, which causes it to contract or to dilate (Giglioni 2009). Hence all senses, with the exception of hearing, depend on this original impact and, ultimately, derive from touch (Telesio 1976, 30; Cassirer 1964, 145 ff.; Giglioni 2013). Even intellectual functions, for him, originate in this impact and are, in themselves, a form of “touching” (Cassirer 1964, 146). Following Telesio’s approach, Tommaso Campanella (1568–1639) claimed that all sensory experiences are caused by the *spiritus* being modified by the “touching” of the external world (Ernst 2010, 119) and that everything in the universe senses, including plants and stones

(Giglioni 2010). Taste and smell received far less philosophical attention, even though the period witnessed “a gradual narrowing of the divide separating taste from the palate (the organ of savoring flavors) and smell from the nose (understood as the metonymical representative of *fiuto*, that is, the ability to detect and interpret clues)” (Giglioni 2013, 16).

Abstract

Though mainly known today for his polemical writings against Bartolomé de las Casas in defense of the Spanish conquest of America and for his views on natural slavery, Juan Ginés de Sepúlveda was one of the most distinguished representatives of sixteenth-century Spanish humanism, ranking alongside Juan Luis Vives and Antonio Agustín. Not only did he write a vast quantity of works on history, law, politics, and chronology; he also produced important Latin translations of Aristotle and Aristotle's third-century AD Greek commentator, Alexander of Aphrodisias. As a translator of, and commentator on, both philosophers, Juan Ginés de Sepúlveda is a notable example of the intellectual richness and depth of Renaissance Aristotelianism. Although a student of the scholastic Pietro Pomponazzi, Sepúlveda learned to be sensitive to the humanistic

concern for Aristotle promoted by Alberto Pio and put into practice by many scholars in this period. Unlike his teacher, Sepúlveda had an excellent command of Greek and was well acquainted with the techniques of the humanists. In his role as a commentator on, and translator of Greek philosophical writings, we see exemplified many of the key features which characterized fifteenth- and sixteenth-century Aristotelianism at its best.

Biography

Born in southern Spain, Sepúlveda studied Greek and philosophy at the University of Alcalá. Inaugurated in 1498 by Cardinal Archbishop Francisco Jiménez de Cisneros, the University of Alcalá applied the program of humanism to its curriculum and to the study of Scripture, even if conservative positions within it ultimately prevailed. As early as 1508, Jiménez himself initiated a great project of biblical scholarship which resulted in the printing between 1514 and 1517 (even though they were not actually published until 1522) of the six volumes of the renowned Complutensian Polyglot Bible (thus called from Complutum, the Latin name of Alcalá de Henares). The foundation of the University had, moreover, its roots in Jiménez's desire for religious reform. The institution became a center for ecclesiastical education, and among its professors and students were the first enthusiastic supporters of Erasmus in Spain.

Having received his first orders in 1515, Sepúlveda was recommended by Cisneros for the Spanish College of Bologna, where he studied under Pietro Pomponazzi until he received his doctorate in 1523. It was at Bologna that Sepúlveda met Giulio de' Medici, the future Pope Clement VII, who encouraged him to begin translating Aristotle's *Meteorology*, *Parva Naturalia*, *De generatione et corruptione*, and the Pseudo-Aristotelian *De mundo*, a task which he continued afterward when he joined the papal curia. In Rome, Sepúlveda enjoyed a prominent role within the papal entourage at the time. As an example, in 1524 – also upon Clement VII's

advice – Erasmus wrote his *De libero arbitrio diatribae sive collatio*, an answer to the arguments which had been put forward by Luther in his *Assertio omnium articulorum per Bullam Leonis X novissimam damnatorum* of 1520. Luther's own reply came very soon and, a year later, he published the *De servo arbitrio*, a treatise in which the German theologian dismantled Erasmus's points. Sepúlveda joined the dispute in 1526 with his *De fato et libero arbitrio contra Lutherum*, in which he drew on Alexander of Aphrodisias's arguments on the matter. Acting once again in response to the suggestion of Clement VII, Sepúlveda decided to translate another text by Alexander of Aphrodisias, in this case his commentary on Aristotle's *Metaphysics*, which was published in 1527.

While in Bologna, Sepúlveda also enjoyed the company of his patron Alberto Pio de Carpi. In the following years, Sepúlveda assisted Alberto Pio in the composition of successive attacks on Erasmus, which culminated in his own *Antapologia pro Alberto Pio* of 1532. Despite Erasmus' shrill diatribe against Alberto Pio, Sepúlveda was advised by Pope Clement VII to keep his *Antapologia* within conciliatory terms. Alarmed by the progress of Lutheranism and aware of the pernicious effects that Machiavelli's thought could have on Christianity, the papal curia was reluctant to open a third front of hostilities and imposed restraint on Erasmus' Catholic critics. Although Sepúlveda's attacks on Erasmus' ideas fully came to the fore during his time in Italy, his attitude encapsulates the complex and at times contradictory nature of Antierasmianism in Spain. As with other Spanish critics of Erasmus, Sepúlveda was forced to tread a careful path between his orthodox views, his close ties with prominent members of the imperial court (a center of Erasmianism until the early thirties), and the demands imposed on him by the ecclesiastical authorities. Sepúlveda's frontal opposition to Erasmus (whose scholarship, however, the Spaniard held in high esteem) is all the more paradoxical given his training at the University of Alcalá.

Pope Clement's death in 1534 was the main reason for Sepúlveda's return to Spain, which

occurred two years later. Sepúlveda's appointment as official historian to the Emperor in 1536 and his selection as one of the tutors to the future Philip II six years later were an incentive to prepare his translation of and commentary on Aristotle's *Politics*, which was completed in 1548. Sepúlveda's finest contribution to Greek scholarship, his annotated translation of the *Politics* was reprinted in 1601 and 1775, the latter coinciding with a movement at the end of the eighteenth century to reprint many Renaissance translations of classical philosophers and scientific writers.

Heritage and Rupture with the Tradition

Proof of Sepúlveda's reputation as a translator can however be traced back to his lifetime and can be found first and foremost in the various reprints of his Latin versions. Except for his rendering of the *Politics*, the whole corpus of Sepúlveda's translations was reprinted in Paris in 1532. A reprint of the *De generatione et corruptione* was further issued in Germany in 1537, and as many as five editions of Sepúlveda's version of Alexander of Aphrodisias's commentary came off European presses between 1527 and 1561. Further evidence of the centrality of Sepúlveda's philological activity within sixteenth-century interest in Aristotle is given by his contribution to establishing the original texts of Aristotle and Alexander of Aphrodisias. Until 1847, when the Greek text was first published, Sepúlveda's version of Alexander of Aphrodisias provided philosophers with a reliable Latin text of an important ancient commentary on one of Aristotle's most studied treatises. For its part, Sepúlveda's translation of the *Politics*, in conjunction with his annotations, became a useful tool for establishing the text of a handful of passages in Aristotle's work.

As with many sixteenth-century volumes, Sepúlveda's translations are often accompanied by dedicatory letters. Many humanists viewed such dedicatory epistles as opportunities for career building. They were used by these writers as vehicles for self-promotion, as a means to gaining financial rewards, and to advance their own humanist cause. Examination of this material

(as well as other "paratexts" such as prefaces, liminary verse, colophons, and so forth) is crucial if we are to understand fully the way authors, publishers, patrons, editors, and translators prepared a given text for its readership. Sepúlveda is no exception in this respect and his dedicatory letters help us to follow his movements in Italy and Spain in the 1520s, 1530s, and 1540s. The texts map Sepúlveda's life from his early years at Bologna in the company of Alberto Pio of Carpi and of Giulio de' Medici, to whom he dedicated, respectively, his translations of *De incessu animalium* and the *Parva Naturalia*, through his move to Rome in 1523, when he dedicated his version of *De generatione et corruptione* to Pope Adrian VI and his translation of *De mundo* to Ercole Gonzaga. The letters also bear witness to Sepúlveda's connection with the intellectual forces of Papal Rome throughout the 1520s and his links with the Spanish political establishment in the early 1530s. Whereas the dedicatory letter to Pope Clement VII prefacing his translation of Alexander of Aphrodisias of 1527 shows Sepúlveda's attempts at securing a prominent role within the Roman curia, his letter to Charles V accompanying the translation of the *Meteorology* in 1532 reflects his gradual approach to the Spanish party.

Sepúlveda's dedicatory letters therefore seem to have served a very immediate purpose and reflect Sepúlveda's efforts to gain patronage from key figures within papal Rome and Imperial Spain at a very precise time in his life. This is further reinforced by the inclusion, in Sepúlveda's own edition of his correspondence published in Salamanca in 1557, of a handful of letters dating back to the mid-1530s in which Sepúlveda discussed his ongoing translation of Aristotle's *Ethics*. Not completed until the mid-1550s, at a moment when Sepúlveda was collecting his own correspondence, this version was, however, never brought to the press despite Sepúlveda's desperate attempts to obtain permission for its publication.

Sepúlveda's choice of dedicatees for his translations doubtless owed to a conscious and careful exercise of self-advertisement. Throughout his life, Sepúlveda was no stranger to promoting his translations even before they appeared. The

publication in 1527 of his Latin translation of Alexander of Aphrodisias's commentary on Aristotle's *Metaphysics* is a good example of this. Aware of the expectations caused (as early as 1523) by the publication of this previously unknown work, in his dedicatory letter to Pope Clement VII, Sepúlveda is keen to highlight the importance of his scholarly enterprise. He is particularly concerned with showing the Herculean task he had to face when he undertook the translation of Alexander's text. Lack of a Greek printed edition and the absence of any Latin version – Sepúlveda points out several times – made it necessary to establish the source text before any translation could be carried out. To prove the arduous nature of his task, Sepúlveda states that he took into account “quattuor antiquissima exemplaria,” full of corrupt passages. Another example of Sepúlveda's self-advertisement tactics is the publication of the translation of and commentary on the *Politics*. Before the text was published in Paris in 1548, the Spanish translator had found an ingenious way to publicize his forthcoming version. In his dialogue *Democrates secundus, sive de iustis causis belli apud Indios* (*The second Democrates, or on the just causes of the war against the Indians*), written three years earlier, one of the characters quotes from Sepúlveda's Latin version of the *Politics*, with only a few slight changes from the printed text. And soon after its publication, in a letter to his publisher dated August 1549, he boasted of the excellent reception given to his translation: “From my friends' letters I learnt that my work has been received by scholars in France, Italy, Germany and Belgium with approval and, so they write, applause.” Despite these claims, Sepúlveda's translation and commentary were not mentioned at all during his lifetime, and it was only after his death in 1573 that scholars started to point out the relevance and quality of his work.

Sepúlveda's zeal in advertising his own translation is a reflection of the fierce competition posed by rival translators of Aristotle. In the case of the *Politics*, Sepúlveda's words as well as silence on the part of his contemporaries are to

be connected to the controversies, which emerged in the first half of the sixteenth century, between those Aristotelian translators like Joachim Périon, who favored a slavish imitation of Ciceronian vocabulary and style, and those, like Sepúlveda, who were not averse to employing nonclassical terminology. In a long passage from the preface to his version of the *Politics*, published not so long after Périon's translation, Sepúlveda outlined his own method and acknowledged the difficulties in harmonizing accuracy and a complete fidelity to Ciceronian vocabulary when translating Aristotle:

And it is not my intention, when translating others' work or explaining Aristotle, to be more Ciceronian than Aristotelian. Indeed there is a big difference between translating into Latin the Greek rhetoricians or historians and the philosophers, particularly Aristotle, who, despite standing out in elegance and correctness, when dealing with obscure and unknown topics, is compelled to use either new words or words never heard by the people and never used by learned men. These problems make it very difficult for the translator to be Aristotelian and Ciceronian at the same time, although it seems to me that I am Ciceronian enough if I have achieved what I attempted, that is to use a plain and clear speech as much as the contents of the source text allow me.

It is, therefore, not surprising that the preface to his translation of the *Politics* is used by Sepúlveda to prove his credentials as translator. Eager to beat competition from other translators, Sepúlveda regrets that he has taken up such a task without any appropriate help, due to the unreliable translations at his disposal. Glossing over the fact that Leonardo Bruni's elegant translation of the text had been available since 1438, Sepúlveda dismisses the work of previous Latin translators of the *Politics*: “I cannot give the name of translators to those who, with excessive fidelity, have rendered this text word for word.” Without naming names, Sepúlveda seems to be referring to William of Moerbeke's version, which is further criticized in a gloss to his translation (“...quem secutus vetus interpres, qui suo instituto Aristotelem ad verbum convertit”).

Sepúlveda's decision to dedicate his translation of the *De incessu animalium* to Alberto Pio should

also be regarded as an attempt to defend his own version against extant translations of the text (most notably that of François Vatable published in 1518). In order to lend prestige to his work – in his dedicatory epistle to Alberto Pio, a champion of Aristotelian studies in his own right, as described by Charles Schmitt – Sepúlveda craftily drops the names of two scholars who have helped him with his translation of Aristotle. He refers to Niccolò Leonico Tomeo (himself engaged in a version of the text at that time) and Pietro Pomponazzi (Sepúlveda's own teacher). He mentions giving his version to these two famous north Italian philosophers in order to solicit their corrections and suggestions. Moreover, as with the preface to his translation of the *Politics*, Sepúlveda employs the prologue to the *De incessu animalium* as an opportunity to attack rival translators of the Aristotelian corpus. In his dedicatory letter, Sepúlveda strongly condemns the method of the Hellenist and Ciceronian Latinist Petrus Alcyonius (1487–1527?), whose translations of Aristotle were published in Venice in 1521. He recalls how he first heard of Alcyonius when he was about to complete his own translation of the *Parva Naturalia*. Advised by Alberto Pio, after reading Alcyonius's version, Sepúlveda decided to write a pamphlet setting out the numerous mistakes he had found in the text of his rival. Alcyonius is not, however, the only target of Sepúlveda's criticism throughout his prefaces. He often censures the carelessness and lack of accuracy shown by previous translators, a factor which – he claims – drove him to attempt new translations of certain Aristotelian texts. As he states in the dedicatory letter to his version of the *Meteorology*, the main reason for producing another translation of the text was “the negligence of those who had translated this work before me.” In Sepúlveda's eyes, the act of translation goes, however, beyond the merely linguistic plane. Hence, his scorn – in his preface to the *De incessu animalium* – of those translators who, neglecting the study of philosophy as a necessary preliminary to producing a Latin version of Aristotle's writings, were confident simply in their

knowledge of both Latin and Greek. It was precisely his superior knowledge of Aristotelian natural philosophy that, Sepúlveda claims, led him to undertake a revision of his first translation of the *Parva Naturalia* only ten years after it had appeared in 1522. Central to Sepúlveda's attacks on his rivals and to his self-portrait as a solitary scholar battling against difficulties of all kind, is therefore the establishment of his stature as a skillful translator.

In Sepúlveda's dedicatory letters, praise of his own exegetical activity goes hand in hand with grateful tributes to the intellectual milieu within which his work was produced. Alberto Pio's contribution to the recovery, dissemination, and editing of the Hellenistic commentators of Aristotle is commended by Sepúlveda, who, through his close association with the Prince of Carpi, was able to use this mass of newly available texts for his own translations. In the preface to his version of the *Meteorology*, he informs us that, during the process of translation, he has consulted the commentaries on the text of Alexander of Aphrodisias and Olympiodorus. Significantly, the manuscript containing Alexander's commentary was borrowed from the Vatican Library sometime in 1518 by Alberto Pio, who kept it until 1524. It is reasonable to assume that, because of the close relation between Sepúlveda and the Prince of Carpi, the former had frequent access to the text of Alexander in Alberto Pio's hands.

Sepúlveda is also careful to present his Spanish and Italian patrons' commitment to scholarship as part of a long-standing tradition of patronage dating back to antiquity, which the Spanish translator is eager to partake. By hailing his dedicatee Charles V as a new Alexander, the Great Sepúlveda implicitly compares himself to Aristotle, who, as recalled by Sepúlveda in his letter to the Emperor, had dedicated his *De mundo* to Alexander (except, of course, that it was not Aristotle). The parallels drawn by Sepúlveda in his prefaces between his patrons and prominent benefactors from the early years of Humanism also reinforce this idea of continuity. In the dedicatory letter to Adrian VI prefacing his version of the *De*

generatione et interitu, Sepúlveda links Adrian's intellectual patronage to the active role, played by Nicholas V in the first half of the fifteenth century, in promoting Latin translations of Greek philosophical texts. Likewise, the Roman curia under Giulio de' Medici (Clement VII) is compared to the courts of his predecessors Lorenzo and Pietro in Florence.

Underlying his eulogy of the Medici and of the scholarly initiatives of Pope Adrian are Sepúlveda's subtle efforts to model himself upon the illustrious translators patronized by the Medici family and the Roman Pontiffs in the preceding century. Of all those, the Spanish translator regards himself as a close follower of the Byzantine scholar Johannes Argyropoulos, a key figure within the history of philosophical translations and whose versions of Aristotle had been commissioned by Lorenzo and Pietro de' Medici. Walking in the footsteps of Argyropoulos, Sepúlveda prides himself on participating in a new style of translation which – since the early years of the former century – had been replacing the rough versions of the Middle Ages and renewing the criteria used until then. Alongside Argyropoulos, he mentions the name of another Byzantine emigré, who dedicated his translations to Pope Nicholas V, Theodorus Gaza, the only one, according to Sepúlveda, who bears comparison with Argyropoulos. Sepúlveda's review of the best fifteenth-century philosophical translators is, however, not restricted to Latin Aristotelian ones. Well acquainted with other philosophical traditions and aware of the availability of translations of and commentaries on a wide variety of Greek texts, he praises Marsilio Ficino, another protégée of the Medici, comparing his activity as a translator of Plato with that of Argyropoulos in the Aristotelian tradition.

Argyropoulos, Gaza, and Ficino are enthusiastically described by Sepúlveda as the pioneers in a new style of translation aiming at replacing the medieval word-for-word method. Yet, the prestige and skill of these scholars as translators do not prevent Sepúlveda from disagreeing at times with their translation criteria as can be seen from a gloss to the *De sensu et sensilibus*. Sepúlveda's

assessment goes, however, beyond minor criticisms of specific passages in the translations. Despite his praise of Argyropoulos and Gaza, he exposes some of the shortcomings in their translation program. When addressing Giulio de' Medici in the preface to his translation of the *Parva Naturalia*, he reminds his dedicatee of the need to undertake versions of those writings not translated by Argyropoulos: "I thought it would be appropriate for me to offer you the translation of works overlooked by Argyropoulos." Moreover, former Aristotelian translators, he points out in the preface to his version of Alexander of Aphrodisias, neglected the texts of the Greek commentators on Aristotle: "For Theodorus Gaza, Johannes Argyropoulos, Ermolao Barbaro and Girolamo Donato all completely kept away from the commentaries on Aristotle." In Sepúlveda's eyes, his translation of Alexander's commentary would thus contribute to a deeper knowledge of Aristotle and fill the gap left by Argyropoulos and Gaza. Sepúlveda portrays himself then as the natural heir to the Byzantine scholars of the fifteenth century:

At the desire of your ancestors Johannes Argyropoulos translated rather fitly and elegantly the great part of Aristotle. For his part, Theodorus Gaza successfully and brilliantly rendered for Nicholas V both the *De natura et generatione animalium* and the *Problems*. Although we would not dare be compared to these men, according to the smallness of our mind, we have pursued their remains since we wish to be grateful to you.

Sepúlveda's versions of Greek philosophy included annotations. Appended only to his translations of the *Parva Naturalia* and the *Politics*, Sepúlveda's notes vary in length. Whereas in the case of the *Parva Naturalia* short annotations appear in the margins of the printed text, the much longer glosses to the books of the *Politics* are placed at the end of each chapter. Numbering a total of seven hundred, of which less than fifty belong to the translation of the *Parva Naturalia*, the annotations, according to Sepúlveda, are to analyze a selection of chosen passages. Some of the glosses to the *Parva Naturalia* deal with matters of textual criticism and other notes to

the text are merely explanations of Greek words or expressions and their nearest Latin equivalent. Sepúlveda's annotations to Aristotle's books on natural philosophy, therefore, constitute an excellent source that allows us to gain a deeper knowledge of his critical and exegetical methods.

Nevertheless, the most interesting annotations, which I would briefly like to discuss in the final part of my entry, are those belonging to the *Politics*. Arguably, their importance lies in the fact that they seem to assist Sepúlveda in making his own reputation as a prominent scholar in the Spanish court. Published in 1548, the version of the *Politics* must be seen as concomitant to Sepúlveda's role as one of the tutors to the future Philip II, a position the Spanish translator had coveted since the early 1530s. His eventual appointment in 1542 seems to be the reason behind his decision to dedicate his translation to the Spanish Prince six years later and to prescribe the text for his education. The contents of the *Politics* – and particularly of those books in which Aristotle reviews the different political regimes – enable Sepúlveda to make a favorable comparison in his annotations between antiquity and his own times, as well as to praise the immediate ancestors of his young dedicatee.

Sepúlveda was, however, drafting his dedicatory letter to Philip at a very crucial moment in his life. In 1548, two of the most prominent theologians from the University of Salamanca, Melchor Cano and Bartolomé Carranza, were asked by the Crown to examine a work completed by Sepúlveda three years earlier in dialogue form and entitled *Democrates secundus, sive de iustis causis belli apud Indios* (*The second Democrates, or on the just causes of the war against the Indians*). According to its author, the American Indians were like “pigs with their eyes always fixed on the ground.” Their brutish behavior, cannibalism, and paganism made them slaves by nature to their Spanish masters. In his *Democrates*, Sepúlveda issued four main justifications for enslaving Indians. First, their natural condition deemed them fit for slavery, and it was the responsibility of the Spaniards to act as

masters. Second, Spaniards were entitled to prevent Indians from engaging in cannibalism as they saw fit. Third, the same went for Indians who sacrificed innocents to their Gods. Fourth, slavery was an effective method of converting Indians to Christianity. Drawing on Aristotle's ideas on natural slavery discussed in his first book of the *Politics*, he concluded that war against the Indians was just on the grounds that they had violated natural law and were barbarous by nature. As Sepúlveda states:

Now compare these qualities of wisdom, inventiveness, magnanimity, temperance, humanity and religion [of the Spaniards] with those little men in whom one can scarcely find the remains of humanity, who not only lack culture, but who do not even use or know of the written word, lack written law, have barbaric institutions and customs, and do not preserve monuments of their history, but only a certain obscure and vague memory of some facts recorded in certain paintings. As for their virtues, if you want to know of their temperance and meekness, what can one expect of men given over to all manner of passions and loathsome fickleness and prone to feeding on human flesh? Do not believe that before the arrival of the Spaniards they used to live in the Saturnian peace sung by the poets; on the contrary, they used to wage war against each other continuously with such a fury that they considered the victory null if they did not satisfy their phenomenal hunger with the flesh of their enemies – an atrocity that is so much more magnificent let alone far removed from the invincible ferocity of the Scythians, who also fed on human bodies, since the former are so cowardly and timid that they can scarcely resist the hostile presence of our men, and often thousands and thousands of them have fled like women on being defeated by a small group of Spaniards whose numbers barely made up one hundred.

Given its inflammatory tone and the arguments it employed, the *Democrates secundus* was denied the royal license without which no book could legally be printed in Spain. Convinced that Bartolomé de las Casas – who in 1542 had written a fiercest critique of Spanish colonialism in the New World, published ten years later – was ultimately responsible for that decision, Sepúlveda pressed his case with the Council of Indies, which in August 1550 organized a debate between the two men. Sepúlveda's position was supported by the colonists and landowners who benefited

from the *encomienda* system. In the *encomienda*, the Spanish Crown granted a person a specified number of natives for whom they were to take responsibility. In theory, the receiver of the grant was to protect the natives from warring tribes and to instruct them in the Spanish language and in the Catholic faith: in return, they could extract tribute from the natives in the form of labor, gold, or other products. In practice, the difference between *encomienda* and slavery could be minimal. Many natives were forced to do hard labor and subjected to extreme punishment and death if they resisted. For his part, Las Casas represented one side of the debate. His position found some support from the monarchy, which wanted to control the power of the *encomenderos*, and within the Catholic Church. Although there was no formal outcome to the affair, the theologians refused to change their minds about the subversive nature of Sepúlveda's text.

Sepúlveda must have, therefore, regarded his dedicatory epistle to the future king prefacing his translation of Aristotle's *Politics* as a good opportunity to rebuild his reputation. The annotations appended to his version could be used by Sepúlveda in order to seek royal endorsement for his views on natural slavery. A gloss to a passage in the first book of the *Politics* in which Aristotle discusses the concept of natural slavery allows Sepúlveda to expound his ideas on the subject before the future King, in theory, the first reader of Sepúlveda's translation as it was Philip to whom the text was dedicated and to whom some of the annotations are directly addressed. Significantly, the annotation to *Politics* 1255 a 32–35 follows very closely the argumentation developed by Sepúlveda in his *Democrates secundus*.

Sepúlveda's dedicatory letters and annotations give us an insight into the ways in which not only did he read Aristotle and the text of Aristotle but also he wished to be perceived and read by his prospective patrons and fellow translators. Fortunately, in the abovementioned 1537 reprint of Sepúlveda's *De generatione et interitu*, we have a first-hand testimony of how Sepúlveda's translation method was actually judged by his contemporaries. Published in Leipzig by Nicolaus Faber,

this pocket-sized volume, of which only one copy is known to exist, includes a series of printed annotations in the margins of the text. Seemingly prepared by the printer, these annotations constitute a reflection on Sepúlveda's exegetical criteria. Particularly interesting are a handful of notes where some of Sepúlveda's solutions are negatively compared to the proposals offered by one of his rivals, the Frenchman François Vatable, whose translation of the text had been published in Paris in 1518. All in all, the commentator seems to prefer Vatable's version to Sepúlveda's translation, which is censured for its freedom and departure from the original Greek. Ironically, the most common feature of Sepúlveda's style is his respect for the contents of the texts to be translated, the pursuit of accuracy, and clarity being a constant theme in his prefaces and dedicatory letters. Despite Sepúlveda's conscious efforts to publicize his versions and translation method during his lifetime, the importance of his contribution to Aristotelian studies would only be fully appreciated in the centuries to come.

Severinus, Petrus

Born: 1540/1542, Ribe, Denmark

Died: 28 July 1602, Copenhagen, Denmark

Jole Shackelford

Center for Medieval Studies, University of Minnesota, Minneapolis, MN, USA

Abstract

Petrus Severinus, a Latinized form of Peder Sørensen, was a Danish contemporary and one-time friend of the astronomer Tycho Brahe. While a university student, Severinus learned of the novel-sounding medical ideas propounded by the Swiss-Austrian physician Paracelsus, editions of whose works were being issued from German and Swiss presses during the 1560s. Severinus and fellow student Johannes Pratensis traveled extensively in Germany, Switzerland, France, and Italy from

1565 to 1571, perhaps acquiring a taste for Paracelsian and Neoplatonist ideas in Basel or Paris. In the spirit of the French physician Jean Fernel, who sought to harmonize Galen's medicine with Platonic philosophy and thus give classical medicine a more Christian interpretation, and the Parisian physician Jacques Gohory, who educed commonalities between Paracelsus' ideas and Neoplatonism, Severinus composed *The Ideal of Philosophical Medicine* (Basel, 1571) with the ostensible aim of reconciling the medicine of Paracelsus with that of the classical giants Hippocrates and Galen. Severinus' synthesis, which used the Aristotelian embryological concept of *epigenesis* as a model for elaborating a basically Neoplatonist emanation theory to explain the origin and development of bodies, produced a general biological theory that Andreas Libavius termed "vital philosophy." Severinus vitalism, positing the development of bodies from seminal ideas placed in nature by a providential God, provided an attractive explanation for medical writers, poets, and natural philosophers in the late sixteenth and seventeenth centuries. Born to bourgeois parents in provincial Jutland in 1540 or 1542, Severinus served as Royal Physician to King Frederik II of Denmark and then his son King Christian IV from 1572 until his death in 1602.

Alternate Names

[Sørensen, Peder](#)

Biography

Petrus Severinus was born Peder Sørensen in Ribe, an important regional town and seaport in southern Jutland, astride the main overland trading route between Denmark and the continent. His basic education at Ribe's Latin school provided him a good grounding in classical letters and eloquence, which enabled him to lecture on Latin poetry at the University of Copenhagen,

where he probably attained his bachelor's degree in 1561. Eager to pursue a medical education, which was not well supported at the university, he went to France in 1562. He returned to Denmark in 1563, when he was granted a canonry to support his study, and he completed a master's degree in Copenhagen in 1564. There he became friends with another aspiring medical student from Jutland, Johannes Pratensis (Hans Filipsen du Pr ), and the two shared a royal stipend to study abroad and matriculated at the University of Padua in 1566. Padua was the leading medical school in Europe at the time, owing in part to the reputation of its anatomists, the recently deceased Andreas Vesalius and Gabriele Falloppio, who was succeeded by William Harvey's teacher Hieronymus Fabricius in 1565. Severinus' writings show no evidence of interest in anatomy or surgery, and it is conceivable that he abandoned Padua for Paris, where he pursued Neoplatonic philosophy and chemical medicine advocated by Theophrastus Paracelsus, as evident from his manuscript on philosophical, astronomical, medical, and cabalistic questions, dated Paris, July 1567. He returned to Italy at some point, completing his signature work reconciling Platonist and Aristotelian natural philosophy with Paracelsian conceptions in Florence in November 1570. Severinus published this book, the *Ideal of Philosophical Medicine* (*Idea medicinae philosophicae*), in Basel, Switzerland, en route home in 1571, where he was appointed Royal Physician to King Frederik II, whose retinue also included the Danish astronomer Tycho Brahe. Severinus served Frederik and his son Christian IV until his death in 1602. Two surviving daughters married government officials, and his son Frederik, an M.D., practiced medicine.

Innovative and Original Aspects

Severinus' significance in the history of science and medicine rests on his 1571 book, which a generation of scholars used as a guide to the complex and poorly articulated ideas of the German heterodox medical writer Theophrastus

Paracelsus. Severinus harmonized Paracelsian medicine with the Neoplatonic metaphysics of Plotinus and the biology of Aristotle and Galen by elaborating on the Stoic concept of *seminal reasons*, making these metaphysical seeds the foundation of his own theory of the generation of entities in the material world. Basically adapting Platonic idealism and Aristotelian epigenetic embryological theory to explain the generation of all material bodies, Severinus articulated Paracelsus' philosophical and medical views as what one critic, Andreas Libavius, termed "vital philosophy."

Impact and Legacy

It was mainly as an expositor of Paracelsian ideas that Severinus was known. Daniel Sennert referred to a "Severinian school" of thought (*secta Severiana*), Hermann Conring – no lover of Paracelsus – regarded Severinus as "the first among the students of Paracelsus," and the obscure Paracelsian writer Johan Kozackius called him "a second Paracelsus." But beyond his capacity as an interpreter of Paracelsus, it was the broad application of his vital philosophy within natural philosophy and medical theory that explains why Severinus and his ideas were widely cited by late sixteenth- and seventeenth-century authors, ranging from Paracelsian authors Thomas Moffett, Oswald Croll, Johannes Hartmann, and Jan Baptista van Helmont to the non-Paracelsians Daniel Sennert, Pierre Gassendi, Robert Boyle, and John Donne, and explains why his conception continued to have relevance to vitalists into the nineteenth century. Severinus' seed concept was employed to explain everything from the appearance of the 1572 supernova by Tycho Brahe to the healing properties and heat of underground mineral waters by Edward Jordan in addition to explaining how diseases arise through physical or metaphysical "transplantation" in the human body. Severinus' legacy is best represented in the extensive commentaries his book elicited, one by the German medical student and physician Ambrosius Rhodius

(1643) and two by the Scottish chemist William Davidson of Aberdeen (1660, 1663).

Sforno, R. Obadiah ben Jacob

Born: Cesena, c. 1470

Died: c. 1550

Marvin J. Heller
Brooklyn, NY, USA

Abstract

R. Obadiah ben Jacob Sforno is considered among the foremost Bible commentators. Author of several commentaries on the Bible and philosophic books, Sforno is best remembered for his *Be'ur al ha-Torah*, a commentary on the Torah (Pentateuch) and his most important work. The *Be'ur* has been reprinted numerous times and is included in every *Mikraot Gedolot* (Rabbinic Bible). The *Or Ammim*, a philosophic work, is in opposition to those tenets of Aristotelian philosophy in conflict with the Jewish religion. Well trained in several fields, apart from his rabbinic learning, Sforno's scholarship was recognized in both Jewish and non-Jewish circles.

Biography

Born in Cesena, Italy, Sforno acquired a thorough rabbinic education and studied mathematics, philology, and philosophy prior to traveling to Rome, where he taught the Talmud, studied, and afterward practiced medicine. His rabbinic learning was recognized by such prominent figures as R. Meir Katzenellenbogen and R. Joseph Colon, both of whom refer to him in their responsa. His standing as a scholar was also acknowledged by Cardinal Domenico Grimani, who recommended Sforno to the humanist Johannes Reuchlin (1455–1522). When the latter sought to improve his knowledge of Hebrew literature and grammar, Sforno wrote and then translated into Latin a work on Hebrew grammar for him. He left Rome in 1525, traveling to Italy, before settling in Bologna, the residence of his brother Hananel, who supported him financially for some time. He founded a yeshivah in Bologna which he headed until his death.

The *Be'ur al ha-Torah*, Sforno's commentary on the Torah (Pentateuch), is his most important work. It is possible that the first draft of the *Be'ur* was written while Obadiah was still in Rome, where he was studying medicine and giving lectures on the Torah. The first edition (Giovanni Gryphio: 4^o: 92 ff.) was printed 17 years after his death in Venice (1567). It is based on a manuscript in his possession during the last years of his life, and is therefore the final version of the commentary. The manuscript was edited by his brother Hananel.

The *Be'ur* is completed with a table of the subject matter of the commentary by weekly Torah readings, and *Kavvanot ha-Torah* (a discourse on the intentions of the Torah). The table is not a listing of the contents in the normal sense of the word; it was prepared by Sforno as an outline of the points he wished to emphasize prior to writing the *Be'ur*. Written in a succinct manner, they serve as questions for the reader. The *Kavvanot ha-Torah* is, to some extent, a supplement and completion to Sforno's *Or Ammim* (Gottlieb and Zev 1980). The subject matter is the structure of the Torah, the rationale of the

precepts, with emphasis on the Temple and sacrifices, and the deeds of the patriarchs.

1567, *Be'ur al ha-Torah*, Obadiah ben Jacob Sforno, Venice

Courtesy of the Library of Agudas Chassidei Chabad Ohel Yosef Yitzhak

Sforno uses a clear and lucid style and is concerned with the literal meaning of the text. Although it is known that he was familiar with kabbalistic works, here he eschews mystical interpretations. He addresses ethical and philosophical issues, referring to both the halakhah and aggadah in the commentary. He is not reluctant to suggest innovative and even controversial interpretations. His varied sources, in addition to the Bible, Babylonian Talmud, and Midrashim for the *Be'ur*,

reveal his extensive mastery of earlier commentators, among them the Rashi, Abrabanel, Ba'alei Tosafot, *Bekhor Shor*, *Hizzekuni*, ibn Ezra, R. Moses ben Nahman (Ramban), R. Samuel ben Meir (Rashbam), Rav Sa'adiah Gaon, and others. *Be'ur al ha-Torah* has proven to be a popular commentary and was utilized by later commentators, frequently reprinted, and included in every *Mikraot Gedolot* (Rabbinic Bible).

Sforno also produced commentaries on several other books of the Bible, on *Avot*, and *Or Ammim*, as well as works still in manuscript. The *Or Ammim* (*Light of the Nations*, Gottlieb and Zev 1980, 4⁰: 64 ff.) is a philosophical work in defense of Judaism written in opposition to those tenets of Aristotelian philosophy in conflict with Jewish belief. In the introduction, he states that he wrote this work because even such a great personage as Maimonides had expressed belief in the correctness of many of Aristotle's theories. Among the Aristotelian positions, which he attempts to refute utilizing not only biblical but also Aristotle's own teachings, are those on the eternity of matter, God's omniscience, and the universality of the soul.

Sforno opposes the position that the Torah is based on belief rather than knowledge; a person must inquire, not being content with mere belief. The Scriptures provide a clearer and more reliable exposition of truth than philosophy. Only the Bible instructs on the central role of man in the universe, which has been created and exists for man, who, made in God's image, is endowed with free will. Man's purpose is thus to become like his Creator. That is why the righteous man who fulfills God's will is more precious to the Creator than the entire universe and all the heavens. Sforno is considered the last of the Jewish scholastic scholars, as reflected in the subject matter and methodology of *Or Ammim*.

Sforza, Caterina

Born: 1463, Milan

Died: 1509, Florence

Meredith K. Ray

University of Delaware, Newark, DE, USA

Abstract

Caterina Sforza (1463–1509) was the daughter of Galeazzo Maria Sforza of Milan and Lucrezia Landriani. After her marriage to Girolamo Riario, a nephew of Pope Sixtus IV, she became countess of Imola and, later, Forlì; following her husband's assassination in 1488, she continued to govern these territories as regent for her eldest son. Caterina Sforza gained widespread fame for her skill in political and military affairs and was known for her interest in collecting alchemical, medicinal, and cosmetic recipes. In 1499, she lost her territories to the forces of Cesare Borgia and Louis XII. After a period of imprisonment in Rome, she was forced to renounce her claims on Imola and Forlì, and spent the remainder of her life in Florence. Caterina Sforza was the mother of the condottiere Giovanni dalle Bande Nere (1498–1526), whose son Cosimo (1519–1574) became the first Medici Grand Duke of Tuscany.

Biography

Born in Milan in 1463, Caterina Sforza was the daughter of Duke Galeazzo Maria Sforza and his mistress, Lucrezia Landriani. Raised at her father's court, Caterina received a humanist education and was tutored by Francesco Filelfo. She

established a close relationship with her stepmother, Bona Maria di Savoia, who had married Galeazzo Maria in 1468; the two remained in contact by letter after Caterina's departure from Milan. Bona's apothecary, Cristoforo de Brugora, kept a medicinal garden, and it may have been through Bona that Caterina was first exposed to the cultivation of botanicals that would interest her throughout her life.

In 1473, at age ten, Caterina's marriage to Girolamo Riario, a nephew of Pope Sixtus IV, was arranged – a union that joined the Sforza and papal families. Four years later, in 1477, she made her way to Rome to join her new husband, where her first son, Ottaviano, was born in 1479. Girolamo Riario continued to amass power and in 1480 was given the lordship of Forlì by Sixtus IV. In 1484, however, the situation changed upon the death of Sixtus IV and the resultant period of civil unrest and uncertainty. In an effort to force the cardinals to negotiate terms favorable to herself and her husband, Caterina – pregnant with her fourth child – occupied the fortress of Castel Sant'Angelo, of which her husband served as castellan. Girolamo, however, was working independently to reach his own terms with the cardinals, and Caterina was compelled to abandon Rome with her husband for their territories in the Romagna. The arrival of Caterina and Girolamo in Forlì met with disfavor by many and Girolamo's subsequent levying of taxes increased hostility toward their rule. In 1488, Girolamo was assassinated in a violent plot orchestrated by the rival Orsi family.

In the wake of Girolamo's death Caterina held on to power, retaliating against the organizers of the conspiracy and ruling as regent for her eldest son Ottaviano. In 1488, she began a relationship with Giacomo Feo, brother of the castellan of the fortress of Ravaldino, and may have secretly married him. The relationship was opposed by some who feared it undermined the power of Caterina's Riario son and heir, Ottaviano, and in 1495 Giacomo, too, was murdered. Retaliating even more forcefully than before against the conspirators, Caterina continued to maintain power. In 1497 she wed Giovanni di Pierfrancesco de'

Medici, known as Il Popolano, who had been sent to Forlì as an ambassador for Florence. Their son, Lodovico, born in 1498 (subsequently renamed Giovanni), would go on to attain fame as a military condottiere known as Giovanni dalle Bande Nere (counts of these events are found in Burrièl, 1795; Braschi, 1965; and Pasolini, 1893).

Caterina's political stratagems and military exploits were legendary and confounded standard expectations for the period regarding women's behavior (Breisach, 1967). Machiavelli, who was sent by Florence in 1499 to negotiate grain prices with Caterina, memorialized in his *Discourses* the story of her defense of the fortress of Ravaldino following the coup that killed her first husband. Machiavelli's well-known account of the episode, which recounts how – in response to her foes' threats to kill her hostage children – Caterina lifted her skirts and retorted that she could make more, helped perpetuate a long-standing perception of Caterina as a Renaissance “virago (Machiavelli, 2001).” This episode – and its effect on the historical characterization of Caterina – is analyzed in depth by Bausi (1991) Freccero (1993), and Pasolini (2000).

In 1499, Caterina's defense of Forlì against Cesare Borgia and French forces earned her similar admiration. Writing of the resistance mounted by Caterina, the marchioness of Mantua, Isabella d'Este noted, “if the French condemn the cowardice of men, they must at least praise the daring and worth of Italian women” (Pasolini 1897, 105n1). This time, however, Caterina's efforts were not successful and she was taken as a prisoner to Rome. After a year of confinement in Castel Sant'Angelo (on invented charges that she had attempted to harm the Pope by sending him a letter contaminated by plague virus), Caterina was forced to renounce all claim on Imola and Forlì. She left Rome for Florence, where she would remain for the rest of her life. Here she spent 5 years fighting to secure the patrimony of her Medici son, Giovanni, winning her case in 1505. She also engaged in charitable works, for example, on behalf of the Benedictine convent of

Le Murate, where she resided on occasion. Caterina died in 1509 of a lung ailment and was buried at Le Murate (de Vries 2010).

Innovative and Original Aspects

Caterina Sforza was deeply immersed in the empirical culture of her day (Ray, 2010). As her correspondence attests, she was known to her contemporaries for her interest in alchemical experiments as well as in medicinal and cosmetic recipes and compiled the information she collected in a manuscript that she passed on to her son, Giovanni delle Bande Nere (Sforza, 1894, Nigrisoli 1928, Nigrisoli 1929, Tabanelli, 1970, Loreti Biondi, 1969, Ray, 2013 and Ray, 2015). This manuscript survives in a sixteenth-century transcription made by Lucantonio Cuppano, entitled *Gli Experimenti de la ex [cellentissi]ma s[igno]ra Caterina da Furlj* (transcribed in Pasolini 1893). This activity situates Caterina within a network of early modern men and women of varying social class who sought out and exchanged “secrets” – information about producing medicinal, cosmetic, and alchemical recipes – as a means to establish status and cement social or political relations (Ray, 2015).

Impact and Legacy

Caterina Sforza was the progenitrix of the Medici grand ducal dynasty in Tuscany. Her son, Giovanni delle Bande Nere, was the father of Cosimo I de’ Medici, the first Medici Grand Duke (Tabanelli, 1972). Caterina’s interests in alchemical and medical secrets can be seen reflected in the subsequent Medici fascination with collecting and experimentation: for example, in the *studioli* of Cosimo and his son Francesco in Palazzo Vecchio in Florence, and in the laboratory space later established by Francesco next to the church of San Marco, known as the *Casino Mediceo*. In the eighteenth century, the story of Caterina Sforza captured the imagination of

figures such as Antonio Gramsci and Gabriele d’Annunzio, who used her example as a political symbol.

Shakespeare, William

Born: 1564

Died: 1616

Patrick Gray and Helen Clifford
Durham University, Durham, UK

Abstract

William Shakespeare (1564–1616) is the world's most highly acclaimed literary figure, known for his plays and poems. Shakespeare is celebrated for his comic touch; kaleidoscopic, tightly structured verse; and genial sense of human nature, manifest in finely detailed individual characterization. Less widely recognized, however, is the depth of his engagement with classical and contemporary philosophy, which bears comparison to more obviously learned contemporaries such as Michel de Montaigne (1533–1592), John Case (c. 1540–1600), and Justus Lipsius (1547–1606).

Biography

William Shakespeare was born in Stratford-upon-Avon in 1564, the son of John Shakespeare, a glove-maker, municipal magistrate, and secret Catholic, and Mary Arden, a member of the

local gentry. He was educated in Latin literature at the local grammar school. He married Anne Hathaway in 1582 and fathered three children by the age of 21. The 7 years that follow the birth of his children, known as Shakespeare's "lost years," remain mysterious, due to lack of historical evidence. Having relocated to London, it seems that Shakespeare began his theatrical career as an actor, and then turned to playwriting in the early 1590s. He also became known for his narrative poems *Venus and Adonis* and *The Rape of Lucrece*, written in 1593–1594 while the theatres in London were closed due to outbreaks of the plague, and dedicated to Henry Wriothesley, Earl of Southampton.

Shakespeare's plays were performed in London by the Lord Chamberlain's Men, which with the ascension of James I in 1603 became the King's Men. Shakespeare himself was a shareholder in the company, as well as the venue they constructed for themselves, the Globe Theatre. While in London, Shakespeare rented a room from the Mountjoys, a family of French Huguenot refugees. In 1596, he secured a coat of arms for his father, proclaiming his status as a gentleman, and in 1597, he bought New Place, at the time the second-largest house in Stratford, demonstrating the scale of the fortune he had acquired from his theatrical ventures in London. Shakespeare seems to have retired to Stratford at some point on or around 1610, perhaps prompted by repeated further outbreaks of plague in London 1603–1609 and died in Stratford in 1616 at the age of 52. Notable contemporaries include Edmund Spenser, Philip Sidney, Christopher Marlowe, Ben Jonson, and George Chapman, as well as the English commentator on Aristotle, John Case, and the Italian expatriate who translated Montaigne's *Essays* into English, John Florio.

Thirty-seven of Shakespeare's plays survive, as well as 154 sonnets, two epyllia, and a few other short poems. Prominent literary influences on Shakespeare's work include Roman comedy, Senecan tragedy, Virgil's *Aeneid*, and Ovid's *Metamorphoses*, as well as Gower, Chaucer, and traditional English mystery and morality plays. His plays about the English Wars of the Roses draw on Holinshed's *Chronicles* and his plays

about Roman history on Plutarch's *Parallel Lives*. Shakespeare cites a passage from Florio's translation of Montaigne's essay "On Cannibals" in *The Tempest*, and debate continues to this day as to the exact nature, timing, and extent of his exposure to Montaigne's thought. Florio's translation did not appear in print until 1603; some scholars, however, see signs that Shakespeare may have read Montaigne's *Essays* earlier, either in English in manuscript, or in another translation, now lost, or in print in their original French (Hamlin 2013, 2016).

Heritage and Rupture with the Tradition

Shakespeare is not typically associated with philosophy in the popular imagination. The depth of his engagement with contemporary as well as classical thought tends to be underestimated, due to two pernicious but abiding myths. The first such myth about Shakespeare is that he was relatively uneducated. Ben Jonson notoriously claimed that Shakespeare had "small Latin and less Greek." John Milton describes him in *L'Allegro* in contrast to "learned Jonson" as "Fancy's child," warbling "native woodnotes wild." Nineteenth-century German Romantics seized upon Shakespeare as a representative outsider or folk artist, whom they saw as happily ignorant of classical norms (Paulin 2012). Shakespeare's disregard for classical rules of decorum, however, as well as neoclassical "unities" derived from Aristotle's *Poetics*, was not in fact naïve, but instead can be better understood as a deliberate rejection of the conventions of Senecan tragedy and Plautine comedy in favor of the more expansive, egalitarian aesthetics of medieval Christian drama (Auerbach 1946; Cooper 2006).

By the standards of our own historical moment, Shakespeare was remarkably well educated in classical philosophy and history, as well as literature (Burrow 2013). He was able to read Latin easily, and he shows some facility with French, as well, in *Henry V*. Over the course of his lifetime, synthetic works such as Cicero's *Tusculan Disputations* and Plutarch's *Moralia*, as well as Montaigne's *Essays*, were translated

into English. Shakespeare cites Aristotle's *Nicomachean Ethics*, for example, in *Troilus and Cressida*: Hector criticizes Paris and Troilus as "young men, whom Aristotle thought / Unfit to hear moral philosophy" (2.2.166–7; cp. 1095a2; Elton 1997). Brutus's funeral oration in *Julius Caesar* adopts the style of Stoic logic, as recounted by Cicero, as well as Seneca (Gray 2016a). Recurrent descriptions of friends and rivals as mirrors in his Roman plays recall Aristotle's *Magna Moralia*, as mediated through John Case's commentary on this treatise, *Reflexus speculi moralis* (1596) (Gray 2017).

The second such misleading but pervasive myth arises from Keats's claim that Shakespeare was a paragon of what he calls "negative capability." In brief, Keats maintains that Shakespeare, unlike Coleridge, does not seek to connect particular instances to the demonstration of more universal principles. This sense of Shakespeare as uniquely comfortable with "ambiguity" proved attractive to mid-twentieth-century critics such as A. P. Rossiter and Norman Rabkin, who present Shakespeare's plays as "undecideable." Their distinctive "ambivalence" is presented as in keeping with the aesthetic ideal Kant describes in his *Critique of Judgment* as "purposiveness without purpose" (*Zweckmäßigkeit ohne Zweck*) (Rossiter 1961; Rabkin 1981).

Nevertheless, Shakespeare does take definite philosophical positions, which can be discerned in repeated instances across multiple plays. Shakespeare lived at a point of transition in which early medieval optimism about the possibility of a partial synthesis of classical philosophy and Christian theology through assimilation of Aristotelian concepts, methods, and terminology was breaking down in light of the resurgence of other forms of classical philosophy such as Stoicism and Epicureanism which were more obviously incompatible with Christian dogma. Within the context of this tension, Shakespeare is interested in ethics above all, and he tends to side with those classical schools of thought about ethics that are more compatible with Christianity against those which are less so. In other words, by the standards of his day, Shakespeare is relatively conservative. As was the case for most

of his contemporaries, his touchstones in terms of philosophy are Aristotle's *Nicomachean Ethics* and Cicero's *De Officiis*, rather than, e.g., Seneca's *De Constantia* or, still less, Lucretius' *De Rerum Natura* (Headlam Wells 2005; Bevington 2008; Gray and Cox 2014; Raspa 2016).

A third obstacle to recognizing Shakespeare's interest in philosophy arises from longstanding disagreement about what kinds of thinking can be considered properly philosophical. When Shakespeare uses the word itself, "philosophy," for example, it almost always means more specifically "moral philosophy." Like the ancient Romans, as well as many of his fellow Renaissance humanists, Shakespeare sees ethics as the central focus of philosophical inquiry, and success in attaining and preserving human "happiness" as its most reliable criterion. In *The Taming of the Shrew*, for instance, Lucentio tells his servant Tranio that he plans to "study/virtue" and "apply" that "part of philosophy" which "treats of happiness / By virtue specially to be achiev'd" (1.1.17–20). Tranio professes to admire such "moral discipline," but does not altogether share his master's "resolve / To suck the sweets of sweet philosophy" (1.1.27–30). "Let's be no Stoics nor no stocks," he begs, "Or so devote to Aristotle's checks / As Ovid be an outcast quite abjur'd" (1.1.31–33). To be a Stoic, as Tranio sees it, is akin to being a "stock": a deaf, dumb, insensate piece of wood. The pun, which goes back to Calvin, implies that being a Stoic, like being put in the stocks, means being forced into unnatural, uncomfortable immobility.

Shakespeare tends to distrust logical deduction. Syllogisms in his plays tend to be instruments of deception, rather than clarification; logic in general tends to be specious. Some of his most celebrated soliloquies are in effect case studies in self-serving, self-deceptive sophistry: Macbeth in *Macbeth*, "If it were done" (1.7.1); Brutus in *Julius Caesar*, "It must be by his death" (2.1.10); Leontes in *The Winter's Tale*, "May't be / Affection?" (1.2.137–8); and so on (Gray 2018a). This wariness towards the traditional tool of the trade, argumentation, puts Shakespeare at odds with Plato, Aristotle, Hellenistic Greek philosophy, and medieval Scholasticism, all of which,

like present-day analytic philosophy, tend to rely on the internal logical coherence of verbal propositions as their litmus test of truth. Instead, like Roman philosophers such as Cicero and Seneca, as well as Renaissance humanists such as Erasmus and Montaigne, Shakespeare tends to evaluate theoretical claims in light of their effects in practice. And by this criterion, he finds, like Montaigne, that Stoicism, in particular, fails to measure up (Miles 1996; Gray 2018b). Recalling the *domina-nutrix* trope of Senecan tragedy, Shakespeare repeatedly depicts characters denouncing attempts to appease their anguish with a conventional Stoic *consolatio* (Gray 2016b). "I pray thee, peace," Leonato says, replying to such blandishment in *Much Ado about Nothing*. "I will be flesh and blood; / For there was never yet philosopher / That could endure the toothache patiently, / However they have writ the style of gods / And made a push at chance and sufferance" (5.1.33–8). When Romeo learns he is banished, Friar Laurence tries to console him with "adversity's sweet milk, philosophy," but Romeo will have none of it. "Hang up philosophy," he cries. "Unless philosophy can make a Juliet, / Displant a town, reverse a prince's doom, / It helps not, it prevails not: talk no more" (3.3.57–60).

In terms of epistemology, critics tend to align Shakespeare, like Montaigne, with Skepticism, building on Keats's sense of his "negative capability," as well as the earlier, more formalist critical tradition represented by Rossiter and Rabkin (Bradshaw 1987; Bell 2002; Hamlin 2005a, b; Cox 2007; Nuttall 2007; Sherman 2007). Shakespeare's skepticism can be easily overstated, however, unless it is balanced by a sense of his more fundamental sympathies. Evaluating abstract conclusions about morality in light of hypothetical concrete case studies is not the same as remaining forever poised in exquisite, unresolved doubt. Shakespeare's emphasis on practical viability as opposed to theoretical consistency to some extent anticipates modern pragmatism (Engle 1993). Nevertheless, his truth-claims are not entirely provisional or unsystematic. Instead, Shakespeare can be better understood as sharing Aristotle's sense of

ethics as inherently somewhat imprecise; a messy business which is to some degree contingent upon circumstance, albeit not absolutely so (*Nicomachean Ethics*, 1098a).

Like Aristotle, as well as Montaigne, Shakespeare is interested in “equity,” that is, in the process of accommodating and adjusting general principles to particular situations (*Nicomachean Ethics*, 1137b; Decoursey 2011). Put in Christian terms, Shakespeare is interested in the tension between the “spirit” and the “letter” of the law. The “problem” in Shakespeare’s “problem plays,” for example, is precisely this question of accommodation. In *The Merchant of Venice*, *All’s Well that Ends Well*, and *Measure for Measure*, known as “problem plays,” Shakespeare evaluates the Christian ethical imperative to forgive others against what are in effect limit cases of its application. He acknowledges the attractions of revenge, as well as arguments for strict justice, but in the end, in keeping with Christian doctrine, upholds the superior use-value of what Portia calls “the quality of mercy” (4.1.180). “It is twice blest,” she explains; “it blesseth him that gives and him that takes” (4.1.182–3).

In sum, Shakespeare does arrive at answers to questions that are recognizably philosophical. His “organon” is not logic, however, but experience. He is not interested in how philosophers arrive at their conclusions, but instead in whether or not those conclusions correspond to his own lived experience. Fiction for Shakespeare, like history for Montaigne, serves as a thought-experiment to test the validity of a school of thought, juxtaposing its claims against representative, hypothetical examples. Once this method is understood, it is possible to see Shakespeare, like Montaigne, as returning to certain familiar philosophical controversies repeatedly over the course of his career. He sides with Cicero on the importance of our obligations to others, for example, against Epicurean exhortations to withdraw from society and “live unknown” (Bate 2008; Greenblatt 2011; Gray 2014). He opts for Aristotelian moderation of the passions, as opposed to Stoic eradication, which he sees as impossible in practice. “‘Tis all men’s office to speak patience / To those that wring under the load of sorrow,” Leonato observes,

“But no man’s virtue nor sufficiency / To be so moral when he shall endure / The like himself” (5.1.27–31). In keeping with a Christian sense of the limits of our unaided human capacities, Shakespeare does not believe it is possible for us to control our emotions reliably through the exercise of our own individual reason, much less eliminate such “affects” altogether. Berowne’s prescient warning in *Love’s Labour’s Lost* resembles the end of Montaigne’s *Apology for Raymond Sebond*, in its keen sense of man’s postlapsarian weakness: “every man with his affects is born, / Not by might mastered, but by special grace” (1.1.149–50).

Having said that Shakespeare’s focus is ethics, there is one notable exception. Turning to metaphysics, Shakespeare does occasionally show characters musing aloud about what seems to be Epicurean materialism, as well as its implications for the Christian doctrine of the afterlife. In *Measure for Measure*, visiting Claudio in prison in the guise of a friar, Duke Vincentio paints a picture of death as no more than “sleep,” which Claudio initially finds convincing and consoling (3.1.17). “Thou art not thyself,” the Duke tells him, “For thou exist’st on many a thousand grains / That issue out of dust” (3.1.19–21). Hamlet, too, wonders if death might be no more than “sleep” and reflects on the permutations of the particles that compose the body. “To what base uses we may return,” he observes, standing in a graveyard. “Why may not imagination trace the noble dust of Alexander, till he finds it stopping a bung-hole?” (5.1.190–92) Horatio balks, but Hamlet gleefully persists, launching into a rhyming jingle: “Imperious Caesar, dead and turn’d to clay, / Might stop a hole to keep the wind away,” etc. (5.1.202–3). Some critics see signs of engagement here with Epicurean atomism, as well as its application in Lucretius’ *De Rerum Natura* as a refuge from fears about the afterlife (Martin 1945). Shakespeare’s use of the word “philosophy” in *Hamlet* lends support to claim that Shakespeare is responding here to Epicureanism: speaking to his friend, Horatio, about the apparition of his father’s ghost, Hamlet renounces this school of thought’s signature materialism. “There are more things in heaven and earth,” he

proclaims, “Than are dreamt of in your philosophy” (1.5.165–6). It is perhaps significant, as well, that neither Hamlet nor Claudio proves entirely able, in the end, to shake off and dismiss his conviction that life continues after death. When Shakespeare invokes Epicurean metaphysics, if indeed he does, he frames it and contains it within Christian orthodoxy.

Innovative and Original Aspects

In his sonnets, as well as his epyllia, Shakespeare invokes and subverts the conventions of Petrarchan poetry such as that of his English contemporaries Sir Philip Sidney and Edmund Spenser. Like Montaigne, as well as Sidney, Shakespeare sees Neoplatonic idealization of romantic love familiar from Italian models such as Dante’s *Vita Nuova*, Petrarch’s *Canzoniere*, and Castiglione’s *Il Cortegiano* as incompatible with human nature. His early comedy *Love’s Labour’s Lost*, above all, undermines Neoplatonic claims about the possibility of mystical transcendence through ascetic self-restraint. The premise of *Love’s Labour’s Lost* is that the King of Navarre and his companions, three young noblemen, vow to withdraw from the world, including especially the company of women, in order to devote themselves to “philosophy.” “To love, to wealth, to pomp, I pine and die,” Dumaine proclaims, “With all these living in philosophy” (1.1.31–2). As one of them, Berowne, predicts, over the course of the play, each of the four men falls in love, breaks his vow, and returns to the world.

Shakespeare seems to have had some doubts, as well, about the possibility of Stoic “constancy” and “patience,” in keeping with debates going back to antiquity regarding Stoic claims about the imperturbable tranquility of the quasi-legendary Stoic sage or *sapiens*. Could such a man really exist? Hamlet praises his friend, Horatio, as a man who is not “passion’s slave” (3.2.73), and Horatio himself describes himself as “more an antique Roman than a Dane” (5.2.348). Yet even he has his moment of suicidal despair, once he discovers that Hamlet has been poisoned. Shakespeare’s most complete picture of a would-

be Stoic is Brutus in *Julius Caesar*, whom he presents as an amiable, misguided, self-deceived hypocrite. Despite strenuous effort, Brutus proves unable to entirely suppress strong emotions such as anger and grief (Nuttall 2007; Gray 2016a).

Shakespeare also seems aware of classical Cynicism. Apemantus in *Timon of Athens*, listed in the dramatis personae as “a churlish philosopher,” is a representative misanthropic Cynic; a model which Timon himself comes to imitate (Pierce 2005). When King Lear goes mad, he encounters a young nobleman, Edgar, in a rain-storm on a heath, disguised as a “poor Tom,” a mostly naked wandering madman. Lear refers to him repeatedly as a “philosopher,” perhaps thinking of Diogenes. “Thou art the thing itself,” Lear proclaims; “unaccommodated man is no more but such a poor bare, forked animal as thou art” (3.4.104–6). Lear then tries to imitate “poor Tom” by stripping off his clothes. Through memorable “bitter fools” such as Feste in *Twelfth Night*, as well as Lear’s Fool in *King Lear*, Shakespeare combines Cynicism with Pauline and Erasmian notions of the secret wisdom hidden in ostensible folly (Hershinow 2014).

Turning to philosophy of mind, supernatural figures such as Puck in *A Midsummer Night’s Dream*, Ariel in *The Tempest*, and the witches in *Macbeth*, as well as Iago in *Othello*, can be understood in part as personifications of the imagination, as this faculty is described in Aristotle’s *De Anima*, as well as his *Nicomachean Ethics*. The Protean mutability, unpredictability, unreliability, and amorality of these characters speak to pervasive concerns about the contribution of “fantasy” or “fancy” to weakness of will (*akrasia*). Anxiety about the susceptibility of the imagination to human “passions” was exacerbated by contemporary Protestant iconoclasm (Rossky 1958). Iago’s relationship with Othello, for example, resembles the relationship between Archimago and the Red Crosse Knight in Spenser’s *Faerie Queene*. Archimago, an allegorical figure for the imagination, takes on the appearance of a Catholic holy man but turns out to be a deceptive, malevolent magician, leading the hero astray (Gray 2007).

Impact and Legacy

Shakespeare's plays are widely considered the best in any language and continue to be performed regularly world-wide. Philosophers have been especially fascinated by *Hamlet*: thinkers who have grappled with the play include Kant, Coleridge, Herder, Hegel, Marx, Schopenhauer, Kierkegaard, Nietzsche, Freud, Wittgenstein, Heidegger, Benjamin, Arendt, Schmitt, Lacan, Deleuze, Foucault, Derrida, Badiou, and Žižek (Kottman 2009; Cutrofello 2014). Hegel, in particular, was exceptionally well versed in Shakespeare's plays, even translating part of *Julius Caesar* into German as a teenager. Hegel's influential account of the master-slave dialectic in his *Phenomenology of Spirit*, for example, may in part be based on Shakespeare's depiction of male rivalry in his Roman plays.

Jacob Burckhardt celebrates the Renaissance as the birth of individualism, and many critics see Shakespeare as sympathetic to this development (Holbrook 2010; Strier 2011). Philosophically speaking, however, Shakespeare, like Hegel after him, was strongly opposed to neoclassical as well as classical admiration for what Lipsius, like Seneca, calls "constancy"; Kant, "autonomy"; and Quentin Skinner, "neo-Roman liberty" (Skinner 1998). Instead, Shakespeare sides with Aristotle, who sees human beings as by nature social and interdependent (*Nicomachean Ethics*, 1097b; Selleck 2008; Kuzner 2011; Gray 2018b). In his *Politics*, as well as his discussion of friendship, Aristotle calls into question contemporary idealization of self-sufficiency. Aristotle's illustration of misguided self-isolation is Achilles' retirement to his ships in Homer's *Iliad* (*Politics*, 1253a; cp. *Iliad*, 9.63): an example which Shakespeare also takes up in his *Troilus and Cressida* (Tilmouth 2013; Gray 2017).

Shakespeare's critique of what he calls "sufficiency" can be seen most clearly, however, in his depiction of the Roman character Coriolanus, who tries and fails to disregard "instinct" and "stand, / As if a man were author of himself. / And knew no other kin" (5.3.35–7). Hegel draws upon such Aristotelian reflections on the inextricable connection between the self and the other,

as mediated through Shakespeare's plays, in his much more abstract articulation of the role of intersubjective "recognition" (*Anerkennung*) in self-definition. More recently, Stanley Cavell has taken up an analogous line of thought, analyzing plays such as *King Lear* and *Othello* in terms of what he calls "acknowledgment" (Cavell 2003).

Abstract

Menahem ben Jacob Shalem, also known as Menahem Agler (and sometimes referred to, incorrectly, as “Menahem Kara”) was an important Jewish Aristotelian philosopher in the late fourteenth- and early fifteenth-century Prague. He wrote the most sophisticated Hebrew philosophical texts in Central Europe during this period. Unlike his colleagues in Prague, Yom-Tov Lipmann Mühlhausen and Avigdor Kara, he rejected Kabbalah and considered Maimonidean philosophy the most authoritative Jewish intellectual tradition. His works paved the way for other Jewish philosophers in Central and Eastern Europe in the late middle- and early-modern ages.

Biography

The dates and places of Shalem’s birth and death are unknown. In 1413 he was a member of the rabbinic court of justice (*beit din*) of Prague together with Yom-Tov Lipmann Mühlhausen and Avigdor Kara. Presumably, he composed his extant works in Prague. It has been suggested that he traveled to Jerusalem once, and then he adopted the Hebrew name “Shalem,” which may be understood as “the Jerusalemite” (Reiner 1984; Yuval 1989; Davis 1993). He is referred to as Menahem Agler in a correspondence he had with Abraham Klausner, an important rabbinic authority in late fourteenth-century Vienna. The name “Agler” may indicate that he originated from Aquileia (in German, Aglar) in northeastern Italy (Kupfer 1973).

Menahem Shalem and his colleague, Avigdor Kara, referred to each other as “my brother” in their writings. This phrase indicates a close relationship, but it is not to be taken literally: in fact, the two had different fathers and there is no reason to believe that they were related in any way. Nevertheless, misled by this phrase, some modern historians refer to Shalem as “Menahem Kara” despite the fact that the latter name is not attested in any primary sources.

In one of his writings, Shalem refers to hallucinations he experienced while he was imprisoned by Christians. Unfortunately, nothing more is known about this incident (see Kupfer 1973).

Works and Thought

Menahem Shalem left behind four major writings: (1) a philosophical compendium treating some of the classical themes of medieval Hebrew Aristotelian literature, such as intellectual perfection, prophetic visions, and proofs for the existence of God; (2) a series of glosses to Moses Narboni’s (cc. 1300–1362) commentary on Maimonides’ (1137/8–1204) *Guide for the Perplexed*; (3) a letter to Abraham Klausner, rabbi of Vienna, about philosophical and theological matters; and (4) a polemic fragment against the Christian doctrine of Trinity (see Kupfer 1973; Talmage 1980;

Shmeruk 1981; for some other, minor works, see Talmage 1983).

Much of Shalem's thought revolved around astral powers interfering with the sublunar world. On the one hand, Shalem held that the movement of the celestial bodies generated astral influences in a mechanical way; on the other hand, he believed that astral spirits had sympathy for human beings, especially philosophers, and they warned them of impending dangers through dreams and visions (Visi 2009).

Shalem believed that conjunction of human mind with the active intellect was possible, and such conjunction, once realized, protected human beings from harmful astral influences. Thus, by pursuing intellectual perfection, one could save himself/herself from the fate determined by celestial movements. On the one hand, following the Maimonidean tradition, Shalem argued that studying philosophical texts could bring about the redemptive perfection of the intellect; on the other hand, unlike Mühlhausen and Kara, he held the study of Kabbalah worthless. Shalem also argued that the Messiah and the prophet Elijah, mentioned in traditional Jewish religious texts as precursor to the Messiah, had allegorical meanings. The former signified allegorically the redemptive conjunction of the human mind to the active intellect and the latter alluded to the spiritual-intellectual development preceding it (Visi 2011).

Legacy

Most of Shalem's works still remains in manuscripts today. A single scribe copied most of the relevant manuscripts during the second half of the fifteenth century in Lesser Poland (Beit-Arieh 1981). Shalem is cited in a rabbinic debate about the possibility of the transmigration of the soul in 1466 in Candia, Crete (Kupfer 1973; on the debate itself, see Ogren 2009). Whether his works influenced sixteenth-century Jewish thinkers or whether one can speak about a continuous tradition of Jewish rationalism among late medieval and early modern Ashkenazi Jews is a debated question (see Kupfer 1973; Davis 1993; Fishman 1997; Reiner 1997; Visi 2011).

Shalom, Abraham ben Isaac

Born: Date unknown, Catalonia

Died: 1492, Catalonia

Abraham Melamed

Department of Jewish History, The Center for the Research of Jewish Culture, University of Haifa, Haifa, Israel

Abstract

Abraham ben Isaac Shalom, active in Catalonia in the late fifteenth century, belongs to the last phase of medieval Jewish philosophy. He typically combined his Jewish learning with influences of medieval philosophy – Jewish, Muslim, and Scholastic. His main writing is *Neveh Shalom* (*Abode of Peace*), a collection of homilies infused with these philosophic influences.

Biography

Shalom was active in the second part of the fifteenth century, one of the last Jewish philosophers in Spain before the great expulsion of the Jews (1492). Little is known concerning Shalom's life. He was active in Catalonia and died there in 1492. Shalom was a typical Jewish scholar of the period, who combined his Jewish learning with deep proficiency in the current philosophical trends. His thought integrated three traditions: medieval Jewish philosophy, mostly Maimonides, Gersonides, and Hasdai Crescas; Muslim philosophy, mostly Averroes, as he was translated into Hebrew; and Scholastic philosophy.

Shalom's main writing is *Neveh Shalom* (*Abode of Peace*), a collection of homilies based on aggadic passages from the Talmudic tractate *Berakhot* (twice published, Constantinople, 1539; Venice, 1574). Into this traditional literary genre, he interpolated various philosophical discussions, influenced by the abovementioned philosophic sources. His main aim here was to prove that "Moses [=Maimonides] is true and his teaching is true." He endeavored to prove the veracity of Maimonides' teachings against his many critics. In this, he joined the fierce Maimonidean controversy which raged in Jewish scholarly circles throughout the late Middle Ages. He fiercely defended the equilibrium Maimonides endeavored to create between the *Torah* and Aristotelian philosophy. He critiqued Gersonides' extreme position which criticized Maimonides for compromising philosophy, on the one hand, and Crescas' position which criticized Maimonides for compromising the *Torah*, on the other, and identified with what he considered to be Maimonides' true balanced position. Attempting this, he often got into difficulties in his quest to harmonize these conflicting authorities. His staunch belief in the authority of Maimonides led him at times to read him allegorically, thereby solving theological problems caused by the plain reading of Maimonides' views. This was also the tactic that he employed in order to answer the criticisms that both Gersonides and Crescas hurled at Maimonides, each from the opposite angle.

Neveh Shalom reveals a careful study of medieval Jewish thinkers, mainly Maimonides, Gersonides, and Crescas, and non-Jewish philosophers, such as Averroes; through him, he was influenced by the Platonic political thought. Shalom, however, is not considered an original thinker. His main motivation was not the revelation of philosophical truth, but apologetic, to defend the theological doctrines of the Jewish faith.

Another important facet of Shalom's scholarly activity was the translations of Scholastic treatises from Latin into Hebrew. This is another example of the increasing influence of Scholastic philosophy on contemporary Jewish scholars. Shalom translated two philosophical writings from Latin

into Hebrew: a compendium of the physical sciences by Albertus Magnus, *Philosophia Pauperum*, under the title *Ha-Filosopyiah ha-Tivit* (i.e., “Natural Philosophy”), extant in manuscript form (Hamburg Ms. 266), and a discussion of certain problems of Aristotle’s *Organon* by Marsilius of Inghen, under the title *She’elot u-Teshuvot* (“Questions and Answers”), partially published during the nineteenth century.

Sidney, Philip

Born: 30 November 1554

Died: 17 October 1586

Michael Mack

The Catholic University of America, Washington, DC, USA

Abstract

Sir Philip Sidney helped usher in the great literary flourishing of the late sixteenth century in England. His posthumously published lyric poetry, prose fiction, and literary theory had an immediate impact on his contemporaries,

including Edmund Spenser and William Shakespeare, and have exerted a shaping influence on the course of English literature to the present day. In his own lifetime, he was widely admired as the embodiment of the ideals of the era, and upon his death from wounds sustained in battle, his life became legendary. Of his literary works, the *Apology for Poetry* is the most philosophical – notwithstanding the fact that in the work Sidney explicitly pits poetry against philosophy (as well as history). In the *Apology* Sidney argues for the ethical and political value of fiction, contending that fiction can bring about self-knowledge that moves readers to repent of their faults and to embrace virtuous action. Sidney draws on a wide array of classical and continental sources, and critics have identified a variety of intellectual currents running through the work. Although critics have argued that one or another programmatic allegiance was decisive for Sidney, no consensus has emerged. What is clear is that Sidney departs from the older conception of poetry as veiled theology to a new understanding of poetry as distinctive and valuable in its own right. Throughout the work Sidney displays such wit and charm that it is difficult to imagine a more winning presentation of his position.

Biography

Philip Sidney (1554–1586), courtier, soldier, and poet, was a leading figure in the great literary flourishing that produced, in addition to his own works, those of Spenser and Shakespeare. He was born on November 30, 1554, at Penshurst in Kent, England, the eldest son of Sir Henry Sidney and Lady Mary Sidney. Sidney’s father’s family had long provided the crown important service. Sir Henry served as Lord Deputy in Ireland and Lord President in Wales and was enrolled in the Order of the Garter in 1564. As H.R. Woudhuysen points out (556), the connections on his mother’s side were even more important: his mother was a childhood friend of Princess Elizabeth. Her brother, Guildford Dudley, married Lady Jane Grey and, with her, was executed by Queen

Mary. No doubt due in part to his uncle's failed attempt to secure a Protestant succession, Sidney was named after Mary's new husband, Philip II of Spain, who was Sidney's godfather and, ironically, against whose troops Sidney was to die fighting. At the court of Elizabeth, Sidney's mother attended the queen, famously nursing Elizabeth to health during her battle with smallpox in 1562, a service from which Lady Mary emerged badly disfigured. Of Sidney's two surviving Dudley uncles, one was made Earl of Warwick and served as Master of Ordnance, and the other, Robert Dudley, who became Earl of Leicester, was a favorite of Queen Elizabeth and for many years her suitor.

Sidney had an outstanding education for his time. He attended Shrewsbury Grammar School in Wales, where Thomas Ashton was master and where he met Fulke Greville, who would become his devoted friend, fellow poet, and admiring biographer. At Christ Church, Oxford, his contemporaries included numerous future luminaries: Walter Raleigh, the historian William Camden, the great promoter of exploration Richard Hakluyt, the Anglican theologian Richard Hooker, and the future Jesuit missionary-martyrs Edmund Campion and Robert Parsons. To complete his education, Sidney made a 3-year grand tour of the continent, beginning in July 1572 when he was part of the English party that traveled to Paris for the wedding of Henry of Navarre (the future Henry IV) and Margaret of Valois. Sidney was already aligned with the Protestant cause through his father, who had arranged aid for the Huguenots, and through his uncle Leicester, who was the leading figure of the pro-Protestant bloc in the court of Elizabeth. The friendships he made with fervent Protestants in Paris confirmed and enlivened Sidney's commitment to the cause of European Protestantism. He met Admiral de Coligny, the Huguenot leader; Phillipe du Plessis Mornay, the first part of whose book *De la Verité de la religion chrestienne* Sidney would translate; François Hotman, the monarchomach political theorist; and, most important, the scholar and diplomat Hubert Languet, who had been converted by Melancthon. Languet served Augustus, Elector of Saxony, and then William of Orange, and he acted as a guide for Sidney throughout his European tour

and continued to mentor Sidney afterward through visits and an extensive correspondence.

Although the Protestant-Catholic marriage of Henry and Margaret was supposed to ensure peace, its outcome was quite the opposite. Five days after the wedding the St. Bartholomew Day's massacre began, and Sidney and the rest of the English party took refuge in the residence of the English ambassador, Francis Walsingham, his future father-in-law. From Paris, Sidney traveled to Frankfurt and then on to Heidelberg, Strasbourg, Hungary, Vienna, Venice, Padua, Florence, Genoa, and back to the Imperial Court in Vienna, returning to England by way of Poland. Because of his family connections, Sidney was received at the great courts of Europe and treated as a prince-in-waiting. The King of France, Charles IX, had been so impressed by Sidney that he made him a baron; William of Orange tried to arrange Sidney's marriage to his sister. In addition to princes, statesmen, diplomats, and humanists, Sidney formed friendships with the botanist Charles de l'Écluse, the physicians Camerarius and Crato von Krafftheim, and the printer Henri Estienne. During his 3 years on the continent, Sidney practiced his French, became fluent in Italian, learned some Spanish and German, worked on his Latin, and studied Greek.

On his return to England, Sidney waited on the Queen at court. In addition to assisting his father with his administrative duties, Sidney participated in tilts and entertainments, and he quickly distinguished himself as a courtier. At Leicester House, where Sidney lived, there arose an informal literary academy, which included Edward Dyer, Edmund Spenser, and Abraham Fraunce, all of whom were in Leicester's service. For the Queen's visit to Leicester's country house in 1578 Sidney composed an elaborate masque, *The Lady of May*, in which the queen is called on to decide which of two suitors should be given the hand of the maiden.

Sidney led a diplomatic mission to Prague in 1578, on the occasion of the death of Maximilian II and the succession of Rudolf II, but otherwise he never received the kind of responsibility for which he was educated and that he deeply desired. Sidney wanted Elizabeth to be more robustly supportive of European Protestantism. Elizabeth, however, was wary of the antimonarchical

constitutionalism that leading European Protestants advocated. Sidney's lack of advancement was certainly due in part to his outspoken support for political alliances with Protestant countries – rather than France – to counter the threat posed by Spain. In 1580, Sidney was forced to retire from court after writing a letter opposing the Queen's potential marriage to the French duc d'Alençon and quarreling with the Earl of Oxford, probably over the same issue.

Sidney served as a Member of Parliament in 1581 and 1584–1585. In 1582 Elizabeth called on him to be part of the escort for Alençon when he traveled to Antwerp, and in 1583 she knighted Sidney, though not in reward for his merits or service but so that he could stand in for his friend Count Casimir, who was being awarded the Order of the Garter *in absentia*. In that same year, Sidney married Frances Walsingham, a daughter of Sir Francis Walsingham, Elizabeth's Secretary of State and a close political ally of Leicester.

In 1585 Sidney was appointed to assist his uncle Warwick, the Master of Ordnance, helping England prepare for the anticipated war with Spain. In this capacity, he oversaw the production of maps and the manufacture of cannons and gunpowder and as a result was involved with mathematicians, engineers, geographers, and astronomers, men including Thomas Bedwell, Thomas Digges, and Thomas Blundeville, who with others would go on to form Gresham College (out of which later would be born the Royal Society).

Elizabeth reluctantly entered into the war in the Low Countries, and in 1584 she sent Sidney to serve as the Governor of Flushing and to fight under the military leadership of Leicester. In 1586, Sidney was wounded in a skirmish at Zutphen and died of the subsequent infection 25 days later at Arnheim, at the age of 31. The nation held Sidney as a hero, as the ideal gentleman and soldier, and in his death he became a legend. He was buried at St. Paul's Cathedral in one of the most elaborate and costly funerals of the age, and his death occasioned numerous literary tributes.

Works

When Sidney left the court in 1580, he retired to Wilton, the estate of his sister Mary, the Countess

of Pembroke. While rustivating at Wilton Sidney embraced his "unelected vocation" and dedicated himself to writing. Sidney wrote for a select audience, and there is no indication that he intended any of his works for print. For his sister, he wrote the *Arcadia*, a massive pastoral romance that introduced the form to England. Sidney later revised the work, and the unfinished revision, published posthumously in 1590 by his sister, became a seminal work of English narrative fiction. Sidney builds into the work the tensions that we now take to be commonplace, such as that between the individual and society. Pastoral had long been used as a vehicle to air philosophical debates and to comment on political and social matters, and in the *Arcadia* Sidney explores questions of government. Unlike Thomas More, Sidney does not advance a radical or utopian vision. Nor does he offer an imaginative version of the radical antimonarchical constitutionalism of his mentor Languet. Indeed, the political order he imagines is a monarchy very much like that of contemporary England. Sidney's fiction presents the pathologies of monarchical government and a vision of how those pathologies are overcome and political health is restored. It is a work that gets its start, like *King Lear*, when Basilius, the king of Arcadia, sheds his royal responsibilities. This fictional treatment of good government and its absence had a special urgency for Sidney and his contemporaries since they could see mirrored in it their own worries about their monarch not having named a successor. Like Shakespeare, who borrowed from the *Arcadia*, Sidney believed good government did not arise naturally but was an art that had to be cultivated with care, an art necessary for guiding an often unruly nature.

In addition to introducing the pastoral romance to England, Sidney gave the nation its first great sonnet sequence. *Astrophil and Stella* along with *Certain Sonnets* were composed probably in 1582. *Astrophil and Stella* is, like Petrarch's *Rime Sparse*, one of the period's greatest and most influential collections of lyric poetry. Its publication in 1591 set off a decade of sonnet sequences, including those of Spenser and Shakespeare.

Sidney's correspondence reveals a broad but earnest attitude, great energy, and a deep faith.

The serious temper of Sidney's mind is evident in the works he chose to translate into English. Sidney translated the Psalms with his sister; part of Philippe de Mornay's theological treatise *De la Vérité de la religion chrétienne*; and, according to Joshua Sylvester, Guillaume de Salluste du Bartas's *La Sepmaine; ou, creation du monde*. All were certainly motivated by Sidney's desire to advance the Protestant cause – and, in the case of du Bartas's hexameral poem, to advance it through poetry. Undoubtedly the best example of the kind of poetry that Sidney advocates in the *Apology* is Spenser's great epic, *The Faerie Queene*, in which Spenser used Sidney himself as the model for Sir Calidore, the hero of Book VI and the exemplar of Courtesy. When William Pitt, one of Britain's greatest statesmen, made Spenser's epic his *vade-mecum*, he was putting the fictional work to use in just the way Sidney would have wished – for virtuous political action (Shepherd 1).

Any claim for Sidney's contribution to philosophy must rest principally on his *Apology for Poetry*. As with most of Sidney's works, the *Apology* is difficult to date precisely. It was written around 1582 and published posthumously in 1595 in two versions that are substantially the same: the *Defence of Poesie* and *An Apologie for Poetrie*. Highly allusive and effortlessly inventive, the *Apology* deploys extraordinary learning with a light, often self-deprecating touch, and the reader cannot but be charmed by the persona that Sidney creates. The form of the *Apology* is that of an epideictic oration, and Sidney's praise of the art of poetry has the standard seven parts. Like Erasmus in his oration in praise of folly, Sidney employs *serio ludere*, though not in as sustained a fashion as Erasmus. Like Erasmus, he was motivated by the overarching desire for reform – in Sidney's case, a literary reform that would lead to ethical, political, and religious reform – and like Erasmus, he includes a long digression on the disappointing contemporary state of affairs, though Sidney's is less biting. A dazzling rhetorical performance, the *Apology* is a piece of literary theory that is itself an important work of literature, one that has had a lasting impact on the understanding of literature and its relationship to life.

In the *Apology*, Sidney defines poetry not as verse but as fiction making. Poetry figures forth an imagined world that mirrors the reader's world, especially in its ethical and political dimensions. In that heterocosm, readers can recognize the truth about themselves and their world – what they are and what they should be – and are inspired by the experience to embrace their better selves in the real world. Sidney gives special emphasis to heroic poetry, which brings forth idealized types that not only instruct and delight readers but also move them to imitate their heroic examples in their own lives. The ideal examples of poetry for Sidney are Virgil's *Aeneid* and Xenophon's *Cyropaedia*. It was with an eye to emphasizing heroic action that Sidney was revising the *Arcadia*, and it was very much this idea of poetry that Spenser produced in the *Faerie Queene*. Spenser, like his patron Sidney, believed that artistic imitation could inspire moral imitation and that a great poem could shape the ethical and political life of a nation.

Heritage and Rupture with the Tradition

Sidney marshals a wide range of classical and continental authorities to mount his defense of poetry. Many of these had already been brought together by Julius Caesar Scaliger in his *Poetices*, the most important single source for the *Apology*. In the syncretistic manner characteristic of the period, Sidney's copious and well-advertised borrowings are synthesized rather than distinguished, sometimes doing violence to the actual positions of the authors he cites. Witness his definition of poetry as “an art of imitation, for so Aristotle termeth it in his word *mimesis*, that is to say, a representing, counterfeiting, or figuring forth – to speak metaphorically, a speaking picture – with this end, to teach and delight” (Sidney 101). Sidney quickly segues from Aristotle on poetry as imitation to poetry as a speaking picture, a commonplace that can be traced back to Simonides, and to the Horatian ends *dulce et utile*.

Despite the literary accomplishments of Chaucer and the Tudor patronage for humanists including Thomas More, John Colet, Desiderius Erasmus, and Juan Luis Vives, imaginative

literature was often held in suspicion in Elizabethan England. The semantic range of the term “poet” was wider than it is today, and the term could be used as a synonym for “rhymers”; it also covered playwrights, and was thus associated with the public theater, a lightning rod for moral outrage in Sidney’s day. As Sidney acknowledges in the long digression at the end of the *Apology*, the derision of contemporary poetry was largely justified. Plato’s arguments against imitation and the stirring of base passions were very much alive in the works of contemporary antihumanist detractors, including the work partially responsible for eliciting Sidney’s *Defense*, Stephen Gosson’s *School of Abuse* (1579), which characterized poets as “Caterpillars of a Commonwealth” (Maslen 3). Although England did not have a single figure such as Savonarola, it did have many influential writers who, in the spirit of St. Augustine of Hippo, deeply mistrusted fiction for its power to lead souls astray and to weaken the national character. These are the fundamental critiques that Sidney rebuts. Distinguishing the art from the often defective products of that art, Sidney defends the art itself by showing how its best products have the power to move individual souls and the soul writ large to embrace virtue.

To assert the great dignity of the name “poet,” Sidney draws on the tradition of praising God as a maker and Nature as his work of art. For Sidney (as for Scaliger), the divine likeness is seen nowhere as clearly as in the human accomplishment of poetry, and the poet is not just any artist but, rather, a “maker” made in the likeness of “the heavenly Maker” (Sidney 100). When Sidney claims that the “wit” of the poet has the “efficacy of Nature [*natura naturans*],” he is following Plotinus’s argument that the artist does not imitate Nature but, rather, the immaterial principles from which Nature is herself derived (*Ennead*, V. viii). Sidney’s poet does not copy the objects found in nature – the traditional objects of artistic imitation – but draws only on his “*Idea* or fore-conceit.” In this pre-Lockean usage, “*Idea*” has not yet descended from the divine to the human mind, and Sidney is claiming for the poet access to nothing less than the divine ideas. Sidney gives the poet the power to use these ideas to inspire and

regenerate “when with the force of a divine breath” the poet “bringeth things forth far surpassing [Nature’s] doings” (Sidney 101). This is a bold claim in sixteenth-century England, where Augustine’s distinction between divine creation (by definition *ex nihilo*) and human making (always out of preexisting matter) was still religiously observed and the only human activities that were dignified with the word “create” were special legal or official acts, such as someone being created a duke. Though avoiding the use of the word, Sidney formulates a theory of human creativity that is a landmark in the history of European self-understanding.

Sidney’s elevated idea of poetry is both a continuation of and departure from the tradition of allegorical poetics. Plutarch had likened poetry to mother’s milk, providing appropriate nutrition for those not yet ready for the solid food of philosophy. Boccaccio and Coluccio Salutati sought to elevate poetry from the lowly status given it by medieval theologians, and they promoted a program of serious yet delightful allegory – poetry as veiled theology. Sidney advances this humanist program, but he does so by radically reframing the debate between the arts. Whereas the arts had been ranked according to the dignity of their object, with theology being the queen of the arts because her object is God himself, Sidney ranks the arts in terms of their ability to bring about the architectonic knowledge “of a man’s self, in the ethic and politic consideration, with the end of well-doing and not of well-knowing only.” Giving priority to the knowledge not of how the heavens go but, rather, of how to go to heaven, Sidney argues that the highest art is therefore the one that best brings about virtuous action, the “ending end of all earthly learning” (Sidney 104).

To determine the human endeavor that most effectively promotes self-knowledge and virtuous action, Sidney rehearses the old battle of the arts and pits the poet against the moral philosopher, on the one hand, and the historian, on the other. In Sidney’s personified treatment, the Philosopher and the Historian each lacks what the other has. The Philosopher teaches what virtue is, but he offers only a wordish description. The Historian has lively examples that appeal to the senses, but

he does not have the Philosopher's mastery of the principles from which virtuous actions spring. In short, the Philosopher has the precept, the Historian the example, but neither has both. The Poet, however, is able to unite general truths to particular examples and, in doing so, brings virtue to life – in a way that not only shows what is good but moves the reader to embrace that good.

The rhetorical underpinnings of Sidney's poetic theory are nowhere more evident than in his assertion of the power of poetry to move readers. Like the antipoetic polemicists, Sidney believed in the persuasive power of poetry: he differed only in that he believed that it could move readers toward virtue as well as vice. Fiction has the power, according to Sidney, to present a "golden world," an ideal reality whose dazzling images of virtue move the reader to embrace those ideals in his or her own life. Acknowledging the fallen state of humanity, in which we can perceive the good with right reason – our "erected wit" – but fall short of reaching it because of our "infected will," Sidney claims for poetry the power to cure the general infection of the human will. Whereas Augustine was cured of his divided will by reading sacred scripture, Sidney says that we can be cured by reading pagan literature. For Sidney no less than for the early Michelangelo, the classical and Christian were fundamentally harmonious, and he had no doubt that the examples of classical heroes could make Englishmen better Christians.

Sidney's idealizing approach owes something to earlier persuasive performances, including Cicero's description of the orator and Castiglione's praise of the courtier (especially in the speech attributed to Bembo). Newman's characterization of the gentleman is a later example of idealized presentations meant to move readers to become what they read. Sidney speaks of this dynamic ironically in the opening of the *Apology*, in which he facetiously claims that an expert equestrian's praise of horsemanship almost persuaded Sidney to wish himself a horse. Sidney's serious point is that heroic poetry has the potential to shape the lives of readers and move them to know, love, and aspire to heroic virtue – to wish themselves not horses or horsemen but heroes.

For Sidney, the ultimate purpose of poetry is to engender virtue. The end of artistic imitation is ethical imitation, and through an effective poem, what begins as an "Idea or fore-conceit" in the "wit" of the poet can become the reader's Idea for his or her own life. Xenophon's idealized version of the historical Cyrus is thus "a Cyrus to make many Cyruses" (Sidney 100). For Sidney, the overarching justification of poetry is that it has the power to transform England into a nation of heroes for whom self-knowledge and virtuous action are one.

Innovative and Original Aspects

Because Sidney's *Apology* is so replete with traditional material, scholars have debated whether what Sidney presents is a coherent, let alone original, theory. Citing Sidney's reliance on his Italian predecessors, Spingarn famously declared, "it can be said without exaggeration that there is not an essential principle in the *Defence of Poesy* which cannot be traced back to some Italian treatise on the poetic art" (257–258). Since Spingarn, however, a long list of critics have claimed to have found a key to Sidney's thought in one or another philosophical, political, or religious program, including the synthesis of Plato and Aristotle's idea of the Idea, the Cusan art of conjecture, Ramist visual epistemology, Protestant poetics, Aristotelian rhetorical theory, and Plato's myth of creation in the *Timaeus*. This author has argued that Sidney models his theory on accounts of divine creation such as that presented by DuBartas. These interpretations all assert that the *Apology* offers an original synthesis that is more than the sum of its many borrowed parts – while differing on the nature of that synthesis. That Sidney's *Apology* is susceptible to so many diverse and weighty interpretations is in itself remarkable, and it certainly would seem to confirm Geoffrey Shepherd's claim that what the work embodies are nothing less than "moments of European self-consciousness" (11). It may well be that the most original aspect of the *Apology* is not its argument but its author, who draws seemingly new conclusions out of traditional material

and carries out this weighty task with his characteristic sprezzatura. Indeed, Sidney's winning persona and extraordinary wit are everywhere apparent in the *Apology*, such that the work has the compelling coherence of the man himself.

Impact and Legacy

Posthumously, Sidney was at the head of the literary flourishing that would include Spenser, Marlowe, and Shakespeare. His impact, indirect as well as direct, is nothing less than monumental. His sonnet sequence made him the "English Petrarch," and his great pastoral romance not only helped inspire a great tradition of English pastoral poetry but also provided a rich store of material on which subsequent writers would draw. Shakespeare borrowed from the *Arcadia*, and Charles I is said to have made Pamela's famous prayer his own while awaiting execution. Samuel Richardson's *Pamela*, a foundational work in the history of the novel, drew the name of his protagonist and much else from the *Arcadia*. Even in the twentieth century the continuing importance of the *Arcadia* was felt by Virginia Woolf, who declared that in it "all the seeds of English fiction lie latent" (Kinney 423). And no less influential than his lyric and narrative works has been Sidney's theoretical justification of the aims and methods of fiction making. Sidney's playfully serious defense of his "unelected vocation" is arguably the most influential account ever given of why imaginative literature matters. Those who want to know where their ideas of literature come from should pursue their luminous originals in Sidney.

Signatura Rerum Theory

Yohei Kikuchihara¹ and Hiro Hirai²

¹Kyushu Institute of Technology, Fukuoka, Japan

²Center for the History of Philosophy and Science, Radboud University Nijmegen, Nijmegen, The Netherlands

Abstract

Natural things sometimes resemble each other. From antiquity to today, either in the East or the West, such similarity is often considered to be a hidden key toward important knowledge for human beings. To recognize this similarity it needs a sort of index, which measures the resemblance between things. A general index can be the external figure of natural things. This is the foundation of the theory called “signature/sign of things” (*signatura rerum*). According to a typical understanding of the sixteenth century, the invisible internal essence or force of natural things was visibly coined on their external figure as a sign. Human beings could decipher such signs by analogy and approach to the universal knowledge of nature or even to the will of God who engraved these signs in nature. The doctrine of *signatura rerum* was a manifestation of this way of reasoning and approach to nature. French philosopher Michel Foucault (1926–1984) addressed it in *Les mots et les choses* (*The Order of Things*), Chapter 2, and made it well known (Foucault 1966).

Sign; Signature

Major Aspects

Historically speaking, this kind of analogical reasoning can be observed everywhere in the world, especially in the field of medicine. A plant, whose figure resembles hands, was often considered to

be efficient for the diseases of hands. If the external appearance of some plants (or sometimes even animals and minerals) resembles the organs of the human body, those plants were believed to be efficient to the diseases and injuries of the corresponding organs.

In Europe, a portion of this doctrine can be observed in the *Materia medica* of Dioscorides, who synthesized the knowledge of pharmacological botany in the ancient Greek world, and in the *Natural History* of Pliny of Rome. Their Western followers of the Middle Ages widely used to acknowledge morphological analogies between medicinal natural things and sick or wound parts of bodily organs. Externally resembling plants were applied for the remedy of the bites by beasts such as snakes and scorpions. Thus, the morphological analogy among natural things was often used in medicine.

In the Renaissance, the doctrine of *signatura rerum* became popular and was discussed widely more than ever. Two major actors contributed to this move: Giambattista Della Porta (1538–1615) and Paracelsus (1493/1494–1538).

Della Porta devoted an entire monograph, entitled *Phytognomonica* (Naples, 1588), to this doctrine. In this work, he enumerated medicinal plants by way of the morphological analogy with the bodily organs. Citrus fruits, by their resemblance with the heart, were considered to be efficient for cardiac diseases. A plant called “pulmonaria” would be efficient for the sicknesses of the lungs. Corydalis was regarded as a medicine for the liver by its external resemblance to the organ. As pomegranates and toothworts resembled the teeth, they were taught to be good for the pains of the teeth. Likewise, he enumerated medicines for the hand, bones, hairs, head, eyes, ears, genital organs, spleen, kidneys, uterus, bladder, etc. (Della Porta 1588).

Not only the shapes of plants but also colors, smells, and other properties were taken into account. Long-life plants were believed to be good for longevity; plants having yellow flowers or saps would cure jaundice; the red petals of roses would purify the blood by purging heat. More curiously, animals having big ears were said to be efficient to bad hearing capacity; plants

growing on the rocks would break calculus; summer plants would be good for summer diseases. Animals, which slept well, would be good for the problem of sleep (Thorndike 1923–1958). By compiling the sum of knowledge about various plants and their signs, Della Porta claimed to follow the tradition which ran from antiquity through the Middle Ages (Della Porta 1588). For him, to understand the correspondence between the human being and medicinal natural things was to reveal the secret of nature, which was also the ultimate goal of his masterpiece, *Magia naturalis* (Naples, 1589).

As for Paracelsus, he tried to approach this doctrine in a more practical aspect. As a medical practitioner, he dealt with plants as medicines according to the analogy with the bodily organs. He believed that each disease had its own remedy which lay hidden as an invisible faculty or power in plants. For him, physicians had to extract this faculty and learn which plant had which faculty. The privileged way to seek such faculties of plants was an analogical thinking, and the signs of things held the key to such knowledge. For example, as *Eufrasia* resembled the eye, Paracelsus considered it to be efficient for eye diseases; he regarded melissa to be good for cardiac diseases since it resembled the heart to his eyes. In the case of St. John's wort, he emphasized the importance of deciphering the veins and fine holes of its leaves as well as the whole shape of its leaves and flowers. For him, the external figures of diverse plants and the particular shapes of their parts were the signs to discover and justify medicines (Paracelsus 1922–1933).

Paracelsus extended his theory from the kingdom of plants to the whole field of nature. He went even further to relate it with celestial bodies on the basis of the correspondence between macrocosm and microcosm. As he was not satisfied with the application of this doctrine to medicine alone, he elaborated it to the level of an overall natural philosophy. Through this system, he wanted to find out useful knowledge for human beings and to understand the truth of the world through the study of nature (Müller-Jahncke 1984, 1985; Bianchi 1987; Bono 1995). Later in his career, Paracelsus tried to transform his theory into a

tool to craft a better society. For him, if shoemakers do a better job by learning the signs of leather, carpenters by those of wood, potters by those of clay, the life of those who use their products would be made better. Each profession would contribute to society as a whole by gaining its professional knowledge through a better understanding of the signs of things. In this scheme, Paracelsus's doctrine of signatures was a practical technique as well as practical philosophy (Paracelsus 1922–1933).

Thanks to Paracelsus's followers such as Joseph Du Chesne (1544–1609), Oswald Croll (1580–1609), Jacob Böhme (1574–1624), Jacques Gaffarel (1601–1681), and Wolfgang Fabricius (1625–1653), the doctrine of *signatura rerum* knew the vague in the seventeenth century (Du Chesne 1603; Croll 1609; Böhme 1621; Fabricius 1653; Hirai 2014). Its afterlife continued in the eighteenth and nineteenth centuries. In this connection, it is possible to say that Kepler (1571–1630) and Leibniz (1646–1716) were under the influence of Paracelsus (Bianchi 1987). Although historian of botany Agnes Arber (1879–1960) criticized it as an obstacle for the development of modern botanical science, the doctrine served as the intellectual foundation of natural philosophy more strongly in that era than in antiquity and the Middle Ages (Arber 1919).

This kind of reasoning based on analogies had a problem. If thorough knowledge about the world was sought by analogy through such signs, the world and its knowledge would share the essentially same structure and become a complex tapestry of interwoven analogies. This correspondence did not signify the identity of the world and its knowledge. Even if similarity between plants and human organs was acknowledged, these plants could not cure the sickness of the corresponding organs.

However, such a gap between the world and its knowledge did not lead to the total rejection of analogical reasoning. The divergence between both demanded another analogy to justify the first analogy. As plants similar to the heart were not only citrus but also melissa or lemon, one analogy required another analogy. Through this,

the network of analogies in the world became stronger. At the same time, the gap covering nature with a veil of mystery sometimes brought forth an unexpected cognition. In his *Natural Magic*, Della Porta described mysterious connections of natural things: pigeons would use the leaves of laurel to protect their babies against magic; elephants would use wild olives as antidotes when they ate chameleons by error.

Since signs were regarded as the words inscribed onto nature by God, they bore the absolute certificate of trueness. Thus, the truth had to be sought by tracing the endless chain of these signs (Bianchi 1987; Bono 1995). As everything in the world was believed to be connected by analogy and full of signs to decipher, the world itself was “magical.” Paracelsus emphasized the necessity to experience the natural world endowed with this endless chain of signs. What he called “experience” was the very “magic” (*magia*), which aimed to reveal the concealed relationship among natural things. The doctrine of *signatura rerum* necessarily comprised magic and experience, both of which were very important in the Renaissance (Kikuchiara 2013).

Silva, Miguel da

Born: 1475–80, Évora

Died: 5 June 1556, Rome

Jeremy Roe

CHAM, FCSH, Universidade Nova de Lisboa,
Lisbon, Portugal

Abstract

Miguel da Silva played a seminal role in transmitting diverse facets of Italian humanist thought and scholarship to Portugal. The foundation for his mediating role was primarily his scholarly dialogue with writers, architects, and artists in Italy and Portugal. Pursuit of his wide-ranging scholarly interests was combined with his diplomatic, political, and ecclesiastical roles as Portuguese ambassador to the Holy See, first minister to John III of Portugal, and finally cardinal during the papacy of Paul III.

Biography

Little is known about da Silva's early years. Through the patronage of Manuel I, he was sent

to study in Paris, where he met Juan Luis Vives. From Paris he transferred to Siena, where he pursued his study of Latin and Greek. During this time, he became close to members of the Medici family, and these contacts would shape the first phase of da Silva's political career. In late 1514 or early 1516, he was appointed ambassador to the Holy See, a post he held until 1525, when he was recalled to Portugal. During this first period of residence in Rome, he forged close ties to the city's intellectual milieu and demonstrated his political capacities as a diplomat.

While in Rome, da Silva benefitted personally, and Portugal politically, from the rise of the Medici popes Leo X and, above all, Clement VII. He also forged close bonds with other members of the Medici circle, in particular Giovanni di Bernardo de Rucellai and Lattanzio Tolomei. Rucellai brought him into contact with prominent Neoplatonist scholars and Rome's literary circles. He is also considered to have fostered da Silva's interest in the Albertian principles of architecture. Da Silva's interwoven philosophical, literary, architectural, and archaeological interests would be developed throughout his life, yet the breadth of his intellectual scope ranged far wider and encompassed "...all the aspects of a universal and encyclopaedic vision" (Deswarte-Rosa 1988, 199).

Da Silva's scholarly legacy is one of patronage rather than authorship. One key indication of his renown and learning is the many dedications authors made to him throughout his life. The one by Francesco Cattani da Diacceto's manuscript treatise *Paraphrasis in Politicum Platonis* (c. 1513) testifies to his philosophical and political interests, while the dedication of the 1522 *Il Petrarca* signals his literary renown. Undoubtedly, the most significant dedication was that of Castiglione's in *Il libro del Cortegiano* (Venice, 1528), which was published in numerous editions and translations. Castiglione's book offers further insight into the literary concerns of Rome's scholarly community, among whom he would have met da Silva. Besides being concerned with the application of learning in the sphere of court life and politics, his

book advocates the use of the vernacular for erudite discourse.

The latter would be a concern da Silva would pursue back in his native Portugal, to which he returned in 1625. While there, he ascended to the top of the court hierarchy and through the influence of Clement VII he likewise gained ecclesiastical prominence as the Bishop of Viseu. In Portugal, his learning was again celebrated in further book dedications such as André de Resende's in his *Erasmi Encomium* (Basle, 1531), which singled out his linguistic, literary, and philosophical prestige, although he and da Silva would later dispute the veracity of antiquarian findings.

Da Silva also commissioned architectural projects for Viseu Cathedral. These projects were designed by Francesco de Cremona and contributed to the wider dissemination of renaissance architectural principles into Portugal. His most celebrated patronage is that of the youthful Francisco de Holanda. Da Silva contributed to the young artist's humanist education, and in particular his knowledge of Rome in preparation for Holanda's journey there in 1538. The visual and literary dimensions of Holanda's manuscript legacy testify to his close contact with da Silva.

Yet, da Silva's name is absent from Holanda's writings due to his fall from grace and flight from Portugal in 1640, due to tensions between John III and the papacy. Exiled in Rome, he was made a cardinal in 1641 by Paul III, which compounded John's antipathy toward him. Da Silva's flight cost him his wealth. Nonetheless, he continued his scholarly activity. For example, a 1549 publication of the *fasti*, discovered in Rome's Forum, included an engraved architectural reconstruction by Michelangelo followed by a sonnet by da Silva; evidently da Silva was still an active participant in Rome's scholarly gatherings that were celebrated in the second book of Holanda's *Da Pintura Antiga*.

Sin in Renaissance Theology

Risto Saarinen

Faculty of Theology, University of Helsinki,
Helsinki, Finland

Abstract

In late medieval and early modern Western thought, sin is a religious concept that needs to be understood against the background of biblical writings and the doctrinal traditions of the churches. Rather than attempting an in-depth analysis of the most sophisticated theological and philosophical discussions, the present entry offers a basic conceptual framework in which such discussions take place between 1300 and 1650. The positions of Martin Luther, John Calvin, Johann Eck, and Ignatius of Loyola are briefly described.

Heritage and Rupture with the Tradition

In the Latin New Testament, the concepts “sin” and “debt” are often interchangeable. For instance, the prayer of Jesus “Our Father” employs “sin” in Luke 11:4 and “debt” in Matthew 6:12. Sinners need forgiveness of their debts. Forgiveness takes place both as an act of grace and in terms of payment. In the social imagination of medieval and early modern people, the logic of

payment and the logic of gift are complementary and overlapping mechanisms (Zemon Davis 2000). By confessing his or her sins, an individual receives forgiveness as an act of divine grace; at the same time, this person pays back some of his or her debt by doing works of satisfaction.

In addition to such economic horizons, the vocabulary of the lawcourt is often employed. The sinful person carries guilt (*culpa*) and deserves punishment (*poena*). Forgiveness covers both the forensic and the economic dimensions of guilt and debt. The legal vocabulary allows for sophisticated distinctions. For instance, in the Augustinian tradition of original sin, future generations may receive the punishment of Adam’s sin even when they have no personal guilt related to it. The baptism of infants can be explained with a view to similar considerations: the baptismal water can cleanse a person from inherited guilt and punishment even when no personal guilt is ascribed to the infant. On the other hand, the baptized person continues to commit actual sins. Therefore, his or her later guilt needs to be reconciled through the mechanism of confession and absolution.

The angelic Fall was typically considered to have been the first sin. It was followed by the original sin of Adam and Eve. While this original sin is, according to the Augustinian tradition, transmitted sexually, the theme of inheritance is predominantly discussed in legal (rather than sexual or corporeal) terms. The sins of an individual person are seen in terms of theological and legal continuity with the first sin. At the same time, each person remains legally responsible for his or her own sins.

The moral dimension is likewise prominent. The distinction between good works and sin is analogical to the distinction between virtue and vice. According to moral philosophy and theology, some moral flaw is found in the sinful person. While forgiveness cannot by itself make sinful persons virtuous, their future virtue can be trained by the works of satisfaction, educational efforts, and the effective powers of sacramental grace. In this manner, the ethical vocabulary of virtue is connected with the quasi-economic interplay of gift and payment.

Standard Catholic theology, in particular Thomism, operates with the help of these three (economic, legal, moral) conceptual frameworks of sin. Legal and moral analogies underline the personal responsibility of an agent for his or her sinfulness. The baptized can, at least in theory, avoid sin and cleanse themselves of culpability through using the sacraments of the church.

Especially in monastic traditions, the moral and legal picture of sin is regarded as superficial, as it does not reach the roots of sinfulness. Monastic theologians often emphasize that emotions and even everyday perceptions are already in themselves sinful. Sin is not something that takes place only after an act of free will; rather, our whole emotional and sensual life is sinful. The words of Jesus regarding the sinfulness of lust (e.g., Matthew 5:28) offer support for such a position. Philosophically, many monastic theologians approach the Stoic ideals of a complete eradication of harmful emotions and a holistic control of one's own inner life. On the other hand, conscious intention and free consent are often thought to be the moral and legal prerequisites of culpably sinful action. If emotions are considered to be judgments in a Stoic fashion, it may be possible to consider harmful emotions as sinful in this sense of culpability (Knuuttila 2004).

Like many monastic theologians, Martin Luther maintains that a merely moral and legal understanding of sin is theologically inadequate. For him, sin is a holistic power of corruption (*Verderbnismacht*) that is connected with the powers of death and devil. While Luther strongly advocates the baptism of infants, he also considers that baptized Christians continue to be sinful in some sense. Christians are "righteous and sinful at the same time," since they cannot eradicate all repugnant harmful emotions during their corporeal life. For this reason, Luther can say, for instance, that Christians commit sin even while doing good works. This is because their good works remain in some sense contaminated with the remnants of their sinfulness (Schneider and Wenz 2000; Bultmann et al. 2007).

For Roman Catholicism, this is a too pessimistic and even Manichean picture of Christian humanity. In the Leipzig disputation of 1519, the

issue of remaining sinfulness was debated between Luther's adherents and the Catholic theologian Johann Eck. The standard Catholic position, defended by Eck, considers that the basic evil desire of concupiscence can be called sin before baptism but not after it. After baptism, conscious sinful intention and consent are needed to make Christians truly sinful. Eck grants, however, that the Church Fathers have dealt with this problem in different ways. He concedes that the Lutheran way of labeling the concupiscence of the baptized Christians as sin is possible if the word "sin" refers to their punishment (*poena*) rather than to their guilt (*culpa*) (Seitz 1903, 242–255). In this manner, Eck shows some understanding of the monastic traditions of the Western church.

The Council of Trent (1545–1563) defines the normative Catholic teaching on sin in its *Decree on original sin* (sessio 5) and *Decree on justification* (sessio 6) (The Council of Trent 1990). The Council condemns, for instance, the Lutheran view that righteous people sin in their good works (sessio 6, canon 25). In this manner, Catholics evaluate the relative importance of remaining concupiscence differently from Protestantism. Basically, Catholics consider that Christians should remain free from sin (sessio 6, cap. 11). John Calvin takes over Luther's radical view of permanently sinful concupiscence (*Institutio* 2, 2, 24) (Calvin 2006). He teaches that human nature is so corrupted that a total renewal of human mind and will is needed (*Institutio* 2, 3, 1–5).

In spite of the confessional divide, we cannot draw the conclusion that early modern Roman Catholicism merely stuck to the old legal and moral vocabulary. The most influential early modern treatise on sin is contained in *The Spiritual Exercises* of Ignatius of Loyola (2009). The readers of Ignatius are expected not only to perform the exercises but to compile a training diary, allowing them to chart their progress in this healing. Ignatius distinguishes three kinds of morally relevant thoughts: some arise from one's own will, others from external good spirit, and still others from external evil spirits. Resisting evil thoughts is counted as merit. Ignatius admonishes the reader to remember the angelic Fall, the sin of

Adam and Eve, and the mortal sins of later people. Such remembrance trains the mind to understand the gravity of sin.

The introspective dimension belongs integrally to the exercises of the first week, devoted to healing from sin. Readers ask who they really are and lessen themselves, first by comparing themselves to other people, second by comparing all humans to angels and saints, and third by comparing all creation to God. The chain from the angelic Fall to human sinfulness is thus reversed and returned to God. This process affords a truthful grasp of one's bodily corruption and foulness. Meditating on hell complements these exercises. Readers are invited to visualize the flames of hell, hear the laments of the souls there, smell the odors, taste bitter things, and feel the burning of the flames. The body and its five senses play an important role in the exercises.

Philosophically, Ignatius's introspective emphasis and his constant attention to the corporeal and sensual existence of human beings are innovative features that have preserved their legacy until our day. Like the early Protestants, Ignatius does not consider sin to consist primarily of moral and legal matters. Rather, the healing from sin concerns the entire corporeal and spiritual existence of human beings. Ignatius wants the reader to train his or her *cogito*, the introspective capacity of thinking about one's own inner world. In many ways, Ignatius is concerned with how the reader appropriates the contents of his or her own mind. Ignatius is thus close to the later German philosophy of *Aneignung*, a concept developed by Hegel and Kierkegaard.

The Protestants also develop techniques to cope with sinful thoughts and emotions. Johann Gerhard's *Meditationes sacrae* (2010) can in some ways be read as the Lutheran counterpart of Ignatian exercises. As the early modern theologians often connect sin with death, meditating on death is a major concern of such techniques. The modern Enlightenment view, according to which death and illness belong to the category of nature, whereas vice, sin, and bad (=corrupt?) will belong to the different category of morality, is not clearly developed in the seventeenth century.

Skalić, Pavao

Born: 1534 Zagreb

Died: 1575 Gdansk

Erna Banić-Pajnić

Zagreb Institute of Philosophy, Zagreb, Croatia

Abstract

A Croatian Renaissance philosopher, theologian, and adventurer, known in the history of philosophy as an ardent follower of Pico della Mirandola and one of the first thinkers who used the term *encyclopedia*, Skalić was a typical representative of Renaissance syncretism.

Alternate Names

della Scala, Paulus; Scalichius, Paulus; Scalicius, Paulus; Scaliger, Paulus; Scaligius, Paulus; Skalić, Stanislav Pavao

Biography

Skalić was born in Zagreb in 1534. After he had finished his studies and earned a master's degree in the *septem artes liberales* in Vienna and a doctorate in theology in Bologna, he went to Rome, where he spent some time in *Collegium Germanicum*. Afterwards, he traveled through Germany, where he converted to Protestantism. In the Protestant phase of his life, he subjected the Church politics to sharp criticism, pleading for the return to the spiritual sources of faith. During this phase, the Protestant version of his *Encyclopaedia* was published in Basel in 1559. The Catholic version of the same work, only slightly modified, would be published 12 years later. During his stay among the Croatian and Slovenian Protestants in Germany, he wrote the foreword for the *Glagolitic Catechism* and became the protégé of John Ungnad.

He was a professor of theology at Königsberg and Tübingen, but due to forgery of the documents that he was using to prove his noble origin, he acquired a lot of enemies and was obliged to flee to Gdansk, Poland. Afterwards, he went to Paris and then to Münster. Eventually, he returned under the aegis of the Roman Catholic Church and wrote Counter-Reformation pamphlets. He died in Gdansk in 1575.

Heritage and Rupture with Tradition

Skalić wrote a great number of works that show that he is a typical representative of Renaissance syncretism. In these works and especially in his main work *Encyclopaedia seu orbis disciplinarum tam sacrarum quam prophanarum Epistemon*, he is trying to reconcile diverse traditions – the Orphic, Pythagorean, Hermetic, Chaldean, Kabbalistic, Platonic, and Aristotelian – and to harmonize them with the Christian doctrine. So he interpreted the doctrines of *Prisci Theologi* in terms of the Christian doctrine of the Trinity. In philosophy, he was a follower of Pico della Mirandola, also a representative of Renaissance syncretism. In his works, he sometimes takes over literally the entire parts of Pico's

texts. In accordance with Pico's fundamental orientation in philosophy, he too defends concordism, i.e., the thesis that it is possible to harmonize Plato's and Aristotle's philosophies. He sees the relationship between man and the world as the relationship between the microcosm and the macrocosm. Skalić thinks that man can influence the world around him, primarily by the use of magic. He associated the thesis on divine providence that governs the world with the astrological notion of causality. Many of his beliefs, and above all the beliefs in the existence of a *philosophia perennis*, were influenced by Agostino Steuco. He was also influenced by the German humanist Johannes Reuchlin. Encyclopedism and concordism are two main features of his philosophy.

Innovative and Original Aspects

Skalić follows the line of Renaissance Platonism that largely relies on Chaldeo-Hermetic-Kabbalistic sources within the tradition of *prisca theologia*. Defending the reform of the Church and the spiritual *renovatio* in general, he pleads for the return to the sources of faith and knowledge that are to be found primarily in the Scripture and in the writings of the Chaldean, Egyptian, Arab, Jewish, Greek, and Latin traditions. He holds all of them compatible with Christianity. The truth contained within all these traditions is one *aeterna sapientia*. It cannot be argued that Skalić was an original thinker, given the fact that the basic feature of his work is syncretism. Skalić is among the first thinkers who tried to give a synthesis of all sciences according to the Greek idea of *enkyklios paideia*. The fundamental intention underlying all his works was *scire omnia scibilia*. Hence, the title of his most important work was *Encyclopaedia seu orbis disciplinarum tam sacrarum quam prophanarum Epistemon*. Skalić, however, was not the first to use this term, as previously often thought. In none of his works did he present an original and unique doctrine of his own.

Impact and Legacy

Skalić left behind numerous works, in which a number of themes are repeated. His work did not have much impact on either the European or Croatian Renaissance philosophers. His adventurous and tumultuous life was of much greater interest to historians than his work.

Skepticism in the Renaissance, History of

Gianni Paganini

Department of Humanities, University of

Piedmont, Vercelli, Italy

Research Center of the Accademia dei Lincei, Rome, Italy

Abstract

Skepticism played a major role during the Renaissance, both before and after the rediscovery of Sextus Empiricus' works and the revival of Pyrrhonism. In its various branches, this philosophical movement connected with various orientations, bringing forth new combinations that, albeit somehow eclectic, revealed its fecundity and strength of innovation. It connected with fideism (Gianfrancesco Pico), rhetoric and dialectic (Talon), occultism and Neoplatonism (H. C. Agrippa), empiricism (Montaigne), Stoicism (Charron), and epistemology and

metaphysics (Sanches and Campanella). Skepticism acted as a factor of moderation in theological debates (Erasmus, Castellion) and had an important impact on seventeenth-century philosophy, until Campanella, Descartes, and Hobbes.

Synonyms

Scetticismo; Skepticisme; Skeptizismus

Introduction

During the sixteenth century the discovery of new continents and new civilizations; advances in medicine, mathematics, and mechanics; and the rediscovery of the Hellenistic philosophies, almost all anti-Aristotelian, raised doubts as to the idea that the ancients and especially Aristotle, with his Scholastic disciples, had built a model of “perfect knowledge.” It was in this intellectual climate that the ideas of neo-academic skepticism, mainly transmitted by Cicero and Augustine, and the rediscovery of Sextus Empiricus’ texts at the end of the century gave new strength and topicality to skeptical objections, questioning consolidated knowledge and calling into discussion even the possibility of achieving an adequate and “scientific” knowledge of reality. Renaissance skepticism was different from ancient skepticism in many particulars: (a) in addition to the critique of knowledge, it also contributed to the crisis of fifteenth-century humanism and its anthropocentric conception, limiting the claims of human excellence that had been especially emphasized by Platonists like Ficino; (b) it intertwined and was confronted with very strong religious needs, typical of a dogmatic religion like Christianity, which, unlike the ancient and mythical religions, could interact more deeply with the issues of theoretical skepticism; (c) it developed the epistemological dimension much more than the ethical one and often interpreted the outcome of skepticism as a disturbing and distressing situation (doubt) rather than in terms of suspension of judgment (*epokhe*) and peace of mind (*ataraxia*);

(d) whereas ancient skepticisms were organized in different schools and conceived themselves as autonomous and self-contained positions, the Renaissance approach was quite eclectic and instrumental, in the name of the ideal of “freedom of philosophizing” (“*libertas philosophandi*”). Therefore, it made different trends combine with each other, as well within as outside skepticism, interpreting this latter as a tactic or a preliminary stage to be included and overcome in a higher synthesis. This explains the different connections that during the Renaissance were established with fideism (Gianfrancesco Pico), empiricism (Montaigne), rhetoric and dialectic (Talon), occultism and Neoplatonism (H. C. Agrippa), and epistemology and metaphysics (Sanches and Campanella). The Renaissance debate on skepticism was very influential also in early modern philosophy, involving great figures such as Bacon, Bruno, Mersenne, Gassendi, Descartes, and Hobbes (Paganini 2003a, 2004b).

Two great classics of historiography have divided the field of history of skepticism, focusing respectively on Pyrrhonism and fideism (Popkin 2003), neo-academic skepticism (Schmitt 1972), and anti-Aristotelianism (Schmitt 1967). New research has revealed a web of connections and uses of skepticism that go far beyond those settings. For all these reasons, Renaissance and early modern skepticism are now studied rather in the field of philosophical controversies than in that of separate philosophical movements (Paganini 2008; Paganini and Maia Neto 2009; Charles and Bernier 2005; Popkin 2008; Maia Neto, et al. 2009; Zerba 2012).

Heritage and Break with Tradition

Broadly meant, skepticism is a doctrine according to which it is impossible to decide the truth or falsity of any proposition. Ancient skepticism was divided in two main branches, Academic and Pyrrhonian. The doctrine of Pyrrho of Elis (ca. 350–ca. 270 BCE) was transmitted especially by Sextus Empiricus, whose texts almost disappeared in the West during the Middle Ages,

except for a few manuscripts (Floridi 2002). Pyrrhonism clearly separated itself from the neo-academic position and is presented by Sextus as a philosophy always open to searching and oriented toward an ethical goal, the tranquility of the mind. Academic skepticism uninterruptedly persisted in European culture, thanks to Cicero's works (Schmitt 1972; Moreau 2001). Deeply marked by the debates between Stoics and Academics over "comprehensive representation," the skepticism passed down by Cicero revolved around the notions of verisimilitude and probability and arrived at an explicit conclusion, even though a negative one, the "knowledge of not knowing." Thus, the Pyrrhonist notion of "phenomenon" remained foreign to Cicero.

Skepticism and Humanism. The influence of Cicero was overwhelming since the beginning of Christianity. The ethics of radical uncertainty and the idea that searching cannot have an end seemed incompatible both with the Ciceronian description of wisdom as "the knowledge of things human and divine" and with the Christian synthesis of philosophy and theology. Some new research has now increased the number of Sextus' manuscripts that were available in the West and that, thanks to a variety of testimonies (Aulus Gellius, Ammonius, Galenus, Lucian, and especially Diogenes Laertius), the life and doctrines of Pyrrho were already known enough, even before the rediscovery of Sextus' first manuscript works, probably owned by Cardinal Bessarion and Francesco Filelfo. The very first important testimonies appeared in dictionaries and encyclopedic works, already in the first half of the sixteenth century (Naya 2000 and Naya 2009). Therefore, the first context of the Pyrrhonian renaissance was entirely humanistic. Florence and Rome were the centers of the nascent interest in the Greek work of Sextus. Other manuscripts were obtained by Lorenzo de' Medici in Florence and probably kept in the convent of San Marco, where the friar-prophet Girolamo Savonarola lived. The great humanist and defender of human dignity, Giovanni Pico used Sextus' *Adversus astrologos* for his harsh criticism of astrology, in which he saw a threat to liberty of man (Pico 1946–1952). His nephew Gianfrancesco, who belonged to

Savonarola's inner circle, was the first to make an extensive use of the whole corpus of Sextus' works. The massive book written by the younger Pico, *Examen vanitatis doctrinae gentium* (Pico 1573), marked a break in the history of Florentine humanism and it is significant that this break was based on a particular reinterpretation of Pyrrhonian skepticism. The uncle Giovanni was looking for a great philosophical vision reconciling pagan, Jewish, and Christian wisdom under the label of a *prisca sapientia*, both pagan and biblical, culminating in the humanistic glorification of man's capacities to rise to the highest level. Marsilio Ficino developed the same idea, relying on the Platonic tradition, in which he saw the firmest ground for a synthesis between pagan philosophy and Christian theology. Against this tendency, Savonarola promoted a radical reform that was directed both against the ecclesiastical decadence and Renaissance humanistic thought based on pagan ideas. In this wake, he encouraged the younger Pico to study Sextus' works as a weapon not only against pagan philosophy, but also against all kinds of philosophy, showing – in the footsteps of Sextus – that it was impossible to reach the truth by means of human reason alone. During his enforced exile around 1510, Pico set out to work on his *Examen vanitatis*. Pico used Sextus to attack the "pagan" dogmatism of Aristotle and his disciples, yet for him skepticism was closely connected to the idea that Christian revelation would be better set up on the ruins of philosophical reason, after the corrosive effect produced by the critique of any rationalist dogmatism (Schmitt 1967). In reality, from a properly philosophical standpoint, Pico seriously misunderstood the true nature and meaning of ancient Pyrrhonism, in which he had only an instrumental interest.

The result seems to be paradoxical. Pico was really one of the earliest Renaissance authors to make an extensive use of *Pyrrhoniae Hypotyposes* and *Adversus Mathematicos*, yet he was in no way influenced by Sextus' anti-dogmatism, as Pico's general approach to philosophy was fundamentally authoritarian and contrary to philosophical liberty. One can observe two main points whereby Pico's philosophy can be qualified

as “Christian,” but not as truly “Pyrrhonist” (despite the label “Christian Pyrrhonism” coined for him and his followers). The first is his misunderstanding of the “zetetic” (investigative) nature of skepticism; the second is his rejection of *ataraxia* as a main moral goal to pursue. In Pico’s view, the truth of revealed doctrine is prior to every investigation and only indirectly confirmed by the destruction of dogmatic philosophies, as well as the superiority of religious end (soul’s salvation) is much more important than every kind of peace of mind (Cao 2007; Cao 2009). The true aim pursued by Gianfrancesco consisted in ridding the reader’s mind of any pagan or rational philosophy and so preparing the ground for a ready reception of bare revelation, according to Savonarola’s project of radical Christian reformation. This does not diminish the importance of Gianfrancesco as one of the first thinkers of the skeptical modern tradition, even though it seriously qualifies his aim. While demonstrating a humanistic interest in his minute presentation of the skeptical modes, Gianfrancesco attenuated or rather transformed the meaning of *epokhe*. In Pico’s view, judgment is more often interrupted than suspended; instead of showing the equipollency (*isosthenia*) of different phenomena and noumena, Pico demonstrates the falsity of all human controversies, until revelation will come up to disclose the real truth from above. For all his philological skills, Pico is personally very far from the psychological situation of uncertainty because – despite the display of Sextus’ dialectical arguments – he does not doubt at all; the source of his convictions is independent from philosophy. Pico criticizes “suspension of judgment” severely, seeing in it “a fault more than an achievement” (Cao 2007, p. 24). In conclusion, the first Renaissance reader of “Pyrrhonism” was at the same time the first to seriously misunderstand its true philosophical contents.

Religious and Cultural Reform. The second and more important religious crisis in which skepticism (more the “label” than the substance of it) played a major role was the Lutheran Reformation. Just as Savonarola and Pico used skepticism to mark the first break in the evolution of Italian humanism, similarly, the polemic between

Erasmus and Luther marked a similar break in northern humanism. In this case, the main reference was not Pyrrhonism, but the New Academy, yet once again the polemic nature of the exchange between the two figures did not help to reach a better understanding of the philosophical contents of skepticism.

Martin Luther in his *De servo arbitrio* (1525) accused Erasmus of arriving at de facto skepticism in theology for his doctrine of human freedom (Erasmus 1524). The reformer not only opposed the humanistic defense of human liberty but also considered as skepticism any doubt regarding his own interpretation of the doctrine of predestination, supported by the dogmatic certainty of being right. “The Holy Spirit is not a skeptic,” he warned Erasmus, maintaining that the believer ought to nourish absolute certainties in this regard. “Indeed, how will he be able to believe in a thing he doubts?” What could have seemed “skeptical” in Erasmus was rather a general attitude of hostility toward an excessive theological determination to investigate intrinsically controversial subjects. It is well known that, according to Erasmus’ conception of human salvation, prevalently moral ends ought to characterize Christianity over the adhesion to cold dogmatic statements. What was polemically presented as skepticism (by Luther) was in reality a profound hostility to investigations that are too exclusively or unilaterally dogmatic, as well as the emphasis put on the value of moderation against theological *rabies*. In fact, Erasmus’ *De libero arbitrio* (1524) was anything but skeptical. The only mention of the “skeptics” in the treatise is hypothetical and Erasmus is very careful to submit any hypothetical position to the authority of the Scripture and the Church. In fact, Erasmus used rational and scriptural arguments to defend the existence of a middle path between Pelagianism and extreme determinism, maintaining a fundamentally Thomist conception of human freedom and responsibility. At no point does Erasmus either suspend judgment or suggest that he does not know about the issue of freedom or about the overall Christian doctrine of grace. What might appear similar to the academic approach (the only one well known at that time) is his

method of comparing and weighing theses and biblical passages *pro* and *con* before assessing the one that is most valid (Backus 2009). Moreover, his humanistic and anti-dogmatic attitude had already found clear expression in his youthful *Stultitiae laus* (1511), written as a reaction to the scholastic theology of the University of Paris. There, he did not hesitate to evoke the Academic approach that evaluates different theses, refusing to take sides in controversial matters, and on the whole preferred to reason in terms not of certainty but of greater or lesser probability: “the variety and obscurity of human affairs is so great that nothing can be known clearly, as was well said by our Academics, the least reckless of all the philosophers.” Although he translated in Latin Galen’s opusculum *De optimo genere docendi*, which was an important source for the knowledge of ancient Pyrrhonism, it would be difficult to find in Erasmus skeptical propositions in a technical sense, such as the suspension of judgment or the impossibility of determining the truth of knowing. Popkin’s thesis, which identifies the classical and skeptical issue of the criterion of truth with the religious problem of the criterion of faith (Scripture or tradition, reason or inspiration) (Popkin 2003, pp. 3–16), is more a retrospection of the seventeenth-century controversies than a true description of the Erasmus-Luther debate.

This same humanistic idea of a “moderate theology” was emphasized by Sébastien Castellion, another author that can be considered relevant for the broad history of skepticism in the sixteenth century, starting from the very title of his major work: *De arte dubitandi et confitendi, ignorandi et sciendi* (published only in 1937). In this work some form of skepticism is present, which is however meant as moderation and restraining from “defining” theological and controversial matters. On the other hand, Castellion maintains that there is sure knowledge of God and his basic precepts, which is available to all mankind through reason and perception of creation. In this, there is no possible skepticism. His “moderation” was tied to a firm defense of the value of tolerance in religious disputes. Castellion had already had a practical confirmation of the link between dogmatism and intolerance when he tried to defend, in

vain, Michael Servetus against Calvin. The author of *De arte dubitandi* considers that it is permissible not to know things that have not been commanded by God and that are not necessary for knowing Him, nor for performing one’s duty. Another polemic opposed him to Beza on the issue of heresy and tolerance, polemic which culminated in Castellion’s work *De haereticis non puniendis* (published only in 1971), definitely an apology of religious toleration and moderation in dogmatic theology. In this work, it is the arguments of academic skepticism (and not of Pyrrhonists) that characterize the debate. Castellion contrasts the great philosopher Socrates, often presented as their ancestor by the neo-academics, with Aristotle and the Peripatetic school; moreover, against Beza’s defamation, he defends the principles of academic skepticism in so far as this school, acknowledging its ignorance, admitted also the inferiority of pagan systems to Christianity (Castellio 1971, pp. 22–23; Backus 2009, pp. 71–85).

In the turbulent yet innovative climate of German humanism, Agrippa von Nettesheim’s work stands relatively apart in so far as he followed a peculiar path that led him to publish, at a distance of few years, the most polemic attack on all sciences, *De incertitudine et vanitate scientiarum* (Agrippa von Nettesheim 1530), and *De occulta philosophia* (Agrippa von Nettesheim 1533), in which he justified the epistemological status of magic on the basis of Neoplatonic philosophy. Despite its wide circulation and fortune, the former book is extremely poor from the point of view of the epistemology of skepticism. There, no philosophical argument for the condemnation of sciences occurs, most of the polemic dwells upon “the sins that all activities are heir to” (Popkin 2003, p. 28), whereas faith is proclaimed the only genuine source of truth, against the instability and unreliability of human opinions. One possible key to understanding this apparent contradiction is to come back to the opening lecture in a course on the *Corpus Hermeticum* held at Pavia in 1515, where Agrippa took on Ficino’s aversion to skepticism (Agrippa von Nettesheim 1600, II, pp. 1099–1100). As Perrone Compagni (2009) remarked, only one year later Agrippa addressed

the same accusation of being vain and quarrelsome to contemporary theologians, treated as “sophists,” and he kept this characterization intact in *De vanitate*. Therefore, Agrippa’s work should be classified neither in the category of “fideism” nor in that of epistemology: rather it is a manifesto for Neoplatonic and Hermetic theology, in which the demolition of sciences and skepticism serves only as preliminary stages or tactical weapons for what he considered a temporary alliance.

In this inflamed atmosphere of religious disputes, a turning point in the history of Renaissance skepticism was marked by the first printed editions (in Latin) of Sextus’ works: *Pyrrhoniae Hypotyposes*, at the hands of the Calvinist Henri Estienne (1562), and *Adversus Mathematicos*, edited by the Catholic Gentian Hervet (1569), while it was necessary to wait until 1621 for the *editio princeps* of the Greek text of both works. The comparison between the prefaces appended by the two humanists shows how theological disputes affected, at the end of the sixteenth century, even the philological reception of ancient skepticism. Both Estienne and Hervet highlighted the anti-dogmatic character of Sextus’ works and stressed also the utility of his argument from the theological point of view, addressing the false certainties of pagan philosophers. Nevertheless, the great divide between Catholicism and Protestantism influenced also the approach to the Hellenistic source. While Estienne, closer to the Reformation, presents the skeptical teaching in terms of moral reform and knowledge, seeing in skepticism the power to heal melancholy (Naya 2001 and Naya 2004), Hervet, ensconced in the cultural atmosphere of the Counter-Reformation, uses skepticism to stigmatize Protestant positions as a fresh example of dogmatism and inconsiderate reliance on human reason for their defense of free examination of Scripture (Floridi 2002, pp. 74–75).

Innovative and Original Aspects

With the first publications of Sextus’ works the philological revival ended and there began a new phase, characterized by the actual appropriation of

skepticism. Michel de Montaigne (1533–1592) and Francisco Sanches (1551–1623) were the main authors that initiated new and modern interpretations of it. They made substantial contributions on the Pyrrhonist and the neo-Academic fronts, respectively.

Montaigne. Michel de Montaigne was the first European intellectual to fully realize the strong impact of the rebirth of ancient Pyrrhonism. He invented also a new literary form, the essay, which allowed him to digress into classical quotations (many from Cicero, Sextus, and Plutarch), anecdotes, and personal meditations. Without being a professional philosopher, practicing the apparently loose form of the essay permitted him to adopt an approach of free doubt and inquisition towards any matter. The essayist *à la* Montaigne is the modern incarnation of the “seeker” (*zētētikos*) or the “inquirer” (*skeptikos*) as it was depicted by Sextus, who practices the skeptical art of *zētēsis* (free research) without being enslaved to any dogmatic authority.

In 1571, Montaigne retired from public life to the tower of his castle. Locked up in his library, he had several Greek maxims (many of skeptical intonation) sculpted on the beams of the ceiling. There he finally began to work on the *Essays*. The earliest were short and impersonal and the following ones deeply influenced by Stoic ideals. The subsequent chapters of 1574–1575 already showed a stronger discontent with Stoical solutions, until the essay that is the longest by far, the *Apology for Raymond Sebond*, resulted in a strong attack on Stoicism, and more generally on any sort of dogmatism, both philosophical and theological. In this chapter, Montaigne heavily drew upon Greek skepticism and especially on Pyrrhonism as presented by Sextus and in the detailed *Life of Pyrrho* contained in Diogenes Laertius.

Montaigne disseminated in the *Essays* Pyrrhonian doctrines, while accurately distinguishing them from academic contaminations. He rethought and popularized technical notions such as “phenomenon,” “criterion,” “*epokhē*” or the suspension of judgment, equipollence (*isostheneia*), “ataraxy” or “apathy,” vicious circle (*diallelos*), and “infinite regress.” Furthermore, he translated Pyrrhonist terminology for the first time

into a modern language, French. His first important contribution had to do with the notion of “appearance” (Montaigne never used the term “phenomenon,” not yet in use in modern languages), which clearly derived from Henri Estienne’s translation and commentary of *Hypotyposes*. When he had to translate Sextus’ crucial chapter (PH I, 19–20) about *epokhē*’s limitations (“Whether skeptics eliminate phenomena”), Estienne felt it necessary to interpolate the text to explain better the sense of the Greek word *phainomena*. To this aim, he used all the variations on the verb “to appear” (Paganini 2008, pp. 38–47). In the next chapter – on the phenomenon as the “criterion” of skepticism (in a pragmatic and non-dogmatic sense: PH I, 21–23) – Sextus established an equivalence between phenomena and *phantasia* – the “sensible representation.” Estienne followed in the footsteps, with his Latin rendering, and these lexical choices were taken up by Montaigne too, who gave thus a phenomenalist and markedly empiricist presentation of Pyrrhonism. In giving a reasoned synthesis of *Pyrrhoniae Hypotyposes* I, 72–78 (Montaigne 1999, pp. 600–601), Montaigne explained the phenomenon by appealing to appearances and, at the same time, tightly connected this notion to that of *fantasie*, meaning not the faculty (as in Aristotle) but the sensitive representation. Thus, the main scene of skepticism for Montaigne became the dichotomy between appearance and reality. The first is knowable. The second, including essences and substances, is unknowable. In fact, this avoided as dogmatic any discourse about independent realities that do not reveal themselves through phenomena.

Montaigne introduced the genuine Pyrrhonist philosophy into early modern philosophy by giving it wide circulation. Before him it was mostly a topic of study for philologists, or was used to give support to apologists, or was intended to provide weapons for theological controversies (Popkin 2003, pp. 44–63; Paganini 2008, pp. 15–60). Montaigne rediscovered skepticism as a true philosophy worth taking seriously in itself. On the other hand, it is certainly true that his dichotomy between appearance and reality suggested a dogmatic residue in so far as Montaigne broke the link between reality and appearances, confining all of our knowledge to the latter. To illustrate this

difficult epistemological limitation, the *Apology* stated the famous dilemma of Socrates’ portrait: how can we be certain that the portrait is a picture of Socrates if we only have access to its representation, namely to appearances (phenomena and images), and do not have access to the original model? (Montaigne 1999, p. 601). In this scenario, the search for the criterion of knowledge is legitimate. Since appearance and reality are split, it is necessary to appeal to a “third” (the criterion) that should guarantee one is similar to the other. In turn, however, this criterion requires a new one for its legitimation, and this should go ad infinitum, bringing forth the aporia of infinite regress. The *diallelos* or vicious circle, as well as the dogmatic pretense to stop the regress to an alleged subjective evidence, would be based only on dogmatic assumptions (Montaigne 1999, p. 600).

In Sextus as in Montaigne, the weak version of *phantasia*, translated by *fantasie* and equated to *phainomenon*, is very different from the Stoic *phantasia kataleptike*; unlike the latter, the former is unable to provide a sure criterion of truth. This acknowledgment, on the other hand, opens the way for the study of the subjective states of the mind in relation to organic equipment of the senses, circumstances, conditions, locations, frequency or rarity, habits, etc. In this way, Montaigne follows the famous ten tropes of Enesidemus’ catalogue. Nevertheless, unlike the relativistic readings of these tropes, Montaigne rediscovers their original spirit. When he compares dreaming and being awake, being sober and being drunk, youth and old age, icteric and correct perception, and health and illness, the author of the *Essays* hints at calling into question the Aristotelian paradigm of “normality” that counted as a pattern of justification of our knowledge: what a “normal” subject, placed in a “normal” situation, with senses and intellect functioning according to nature, “normally” perceives of reality. One must read Montaigne’s paradoxical claim: “We are always with some sickness” (Montaigne 1999, p. 569), as a subversion of this paradigm. In the *Apology*, to perceive an object always means to be in a subjective state that reflects the quality of the subject rather than

the nature of reality itself. To be more exact, any state of the mind reflects a peculiar mixture of both subject and object. When perceiving a thing, Montaigne says, we accommodate ourselves to it, with the result of transforming the thing according to ourselves. This process of assimilation is at the same time a process of falsification that prevents us from judging what the thing is in itself: “Now, because our state accommodates things and turns them according to itself, we do not know what the actual things are anymore; as nothing comes to us but falsified and altered by our senses” (Montaigne 1999, p. 600; cf. 562, 587, 592, 599, 603).

In reality, the person “who judges by appearances judges on the basis of something different from the thing itself” (Montaigne 1999, p. 601), relying on phenomena belonging to the subject and its states and not strictly to the object. As a consequence, for a Pyrrhonist such as Montaigne is especially in layer (B) of the *Apology*, perceptions and any sort of mental representations are not warranted either epistemologically or ontologically. Besides these epistemological considerations, Montaigne helped transform skepticism into a modern way of living, suited to the different intellectual situations presented by modern European Christianity at the time of religious divisions and wars. Accordingly, Montaigne elaborated a new concept of belief, emphasizing its emotional character and giving prominence – in the field of religion – to that particular instinct from above that is divine grace. In spite of these overtures to fideism, the *Essays* presented a disenchanted view of the all-too-human form that religions take when they are transformed into superstition and intolerant fanaticism. His skeptical approach was hostile to the Inquisition and religious violence, criticizing war and especially the colonization of the New World. Reflecting on the oppressive and ferocious conduct of the *conquistadores*, he claimed that contemporary Europeans were much more “barbarians” than the so-called savages.

Another important innovation of Montaigne (Paganini 2008, pp. 52–60; Eva 2009) is the ubiquitous synonymy between skepticism and doubt, whereas ancient skepticism was much more

focused on *epokhe* and consequently on *ataraxia*. Benson Mates (1996, p. 30) showed how unsatisfactory it is to translate simply as “to doubt” the verb used by Sextus, *aporein*. In fact, although Montaigne correctly retrieved the main *phonai* (voices) of ancient skepticism and showed how they converged into the suspension of judgment (Montaigne 1999, p. 505), nonetheless, when he had to briefly summarize the doctrine and defend it from the accusation of being self-contradictory, he drastically reduced the whole bunch of these keywords to only two; the former was the formula of Socratic ignorance (“I ignore”), the latter the profession of doubting (“Je doute”) (Montaigne 1999, p. 527). In fact, both formulas are more a betrayal than a transmission of the genuine meaning of the *epokhé*, substituting a balanced neutrality with either a dogmatic denial (“I do not know”) or a statement of wavering perplexity (“I doubt”). This is not without consequences for the overall meaning of skepticism, because doubt is for Montaigne a state of restlessness and discomfort rather than of calm and liberation from emotion, as skeptical *ataraxia* should be. Through this shift, one can see how the author of the *Essays* was influential on our modern view, whereby skepticism and doubt have become co-extensional and synonymous.

Neo-Academics. Pyrrhonism became available to philosophers in its entirety only in the late Renaissance, whereas Cicero’s *Academica* was known much earlier, starting from Petrarca and Valla; it was printed in 1471 with Cicero’s other works. One of Petrus Ramus’ friends, Omer Talon, wrote in 1547 a work with nearly the same title, aiming at supporting Ramus’ attacks on Aristotle and Aristotelianism, in the wake of the “freedom of philosophizing” (Talon 1547; Schmitt 1972, pp. 78–108). Another work, still under the title of *Academica*, was published by Pedro de Valencia in 1596 and was considered as a proof that the Academic position was certainly much better known at the end of sixteenth century than at the beginning (Schmitt 1972, p. 75). In fact, as Laursen has convincingly shown, Pedro’s use of academic skepticism did not implicate a full allegiance to this trend, but rather involved a humanistic approach, skeptical only in the wider

sense of historical and critical exploration (Laursen 2009).

Sanches. The current of thought deriving from the New Academy was still alive and Francisco Sanches was much influenced by this kind of philosophy, as one can tell from the very title of his work (*Quod nihil scitur*, 1581) that reflects the classical formula of *akatalepsia*. In this work the distinction between Academics and Pyrrhonians seems to be erased in favor of the more general and indifferent category of “skeptics” and there are no traces in it of the Pyrrhonian notion of phenomenon (Paganini 2004). Sanches starts his work with the sentence: “I do not even know this, that I know nothing.” It is not by chance that Sanches’ work is clearly indebted to Augustine’s method of refuting the Academics, as can be seen from his “motto proposition” that clearly is a radicalization of knowledge of not knowing. He goes on to show the advantages of this argumentative strategy. If he is able to prove the initial premise, then he is right to infer that “nothing is known” (“nil sciri”); if on the contrary he does not prove the initial premise, so much the better, even from the standpoint of total skepticism (Sanches 1955, p. 4). Actually, the initial assertion will be confirmed (Lupoli 2009).

Quod nihil scitur is also a piece of dramatic rhetoric in the history of skepticism as Sanches does not scrimp on tragic tones. The idea of doubting as a result of despairing (“Despero”) that follows a passionate yet vain research lies at the base of the Portuguese doctor’s work. His research does not surrender to authorities, keeps investigating nature (“I keep on [asking]),” follows only rational investigation, and ignores the deceptive suggestions of rhetoric and dialectic. In the “Republic of Truth” it is better to doubt, to follow experience and reason than “swear on authorities.” Aristotle, with his dogmatic pretensions, is the worst enemy of the skeptic. In fact, Aristotle was “a human being like us,” warns Sanches, and although he presented himself as “one of the sharpest scrutinizers of nature,” he was often mistaken and unaware of many things (Sanches 1955, p. 28, 33–37).

However, *Quod nihil scitur* also contains doctrines that attempt to go beyond doubt. Besides

professing ignorance, Sanches develops another theme that constantly accompanies doubt: the return to oneself after the disappointment of not knowing. “I am going to return to myself, calling everything into question,” This is the second advice, with *akatalepsia*, that Sanches inherits from Socrates: the Delphic demand to know oneself. This topic takes on a more technical meaning in Sanches, being tightly connected to his classification of human knowledge. Knowledge is organized in accordance with the diversity of things that “the mind knows in different ways.” Sanches distinguishes between external – therefore sensible – and internal – therefore only intellectual – knowledge. Above all, he reconceives the status of “internal” knowledge that, according to him, the mind acquires by itself without the mediation of *species*. Being immediate and intuitive, this internal knowledge enjoys a special status and is absolutely certain. In this way, Sanches succeeds in giving an affirmative answer to the question that is at the heart of his research, namely whether one can say “something which would not be suspected of falsity.” In his attempt to positively answer this question, the author starts with the “maker’s knowledge” principle, according to which one only knows things that he is able to bring about (Sanches 1955, p. 30). Obviously, this principle applies to whatever is made by or happens in our intellect, in accordance with a criterion of self-transparency of the soul. Accordingly, the certainty about our own thinking, willing, and desiring is more perfect than any possible certainty regarding what comes from outside: “For I am more sure that I possess both inclination and will, and that I am at one moment contemplating this idea, at another moment shunning or abominating that idea, than that I see a temple, or Socrates. I have said that we are certain about the real existence of those things that either exist, or else originate, within ourselves” (Sanches 1955, pp. 32–33).

Nevertheless, what keeps making “our condition unhappy” is that there is some sort of inverse proportion between the “understanding” (or comprehension) and the “certainty” of knowledge. The more the mind is certain of a thing, the less it is able to understand the same and vice

versa. It follows that we are absolutely certain that “we think, we want to write,” etc., but “we do not know what this thought, this will, this desire is.” As regards comprehension or understanding, on the contrary, “the knowledge of external things through the senses is greater than the knowledge of internal things without the senses.” The opposite happens as regards certainty. In this case, knowledge “of things that are either in us or made by us” is of indubitable certainty. The knowledge we get through “discourse and reasoning” is much less reliable as it is not immediate and intuitive (Sanches 1955, p. 33).

It was therefore a result of great importance when the skeptic of the Renaissance harmonized the Delphic precept of knowing oneself with the activity of doubt (Yrjökonen 2000). In this way they not only considered Socrates as an ancestor of skepticism, but they went also much beyond the Augustinian thesis (“si fallor sum. . .”), which was too straightforward in refuting skepticism on the basis of the knowledge of the self. By distinguishing between internal and external states and explaining how it is possible to acquire much knowledge without going outside of oneself, Sanches enriched the tradition of early skepticism with an aspect that was absent from the Pyrrhonist tradition and was not that developed in the neo-academic trend (Paganini 2008, pp. 322–344; Paganini 2016).

Charron. At the beginning of the seventeenth century another influential figure was Pierre Charron (1541–1603) who, in his treatise *La sagesse* (1601, 1604 second edition modified), succeeded in systematizing Montaigne’s thought. Charron’s work was such a success that it became a milestone for the whole culture of the *honnête homme*, both in skeptical-libertine versions and in the Cartesian one. Charron uncovered a new face of skepticism, which had deep impact on the common image of this movement during the seventeenth century and later. In his work, the skeptical sage is not only an active and important character, but he also breaks away from the classical Pyrrhonist pattern as well as from its more recent reenacting in Montaigne’s *Essays*. As regards the ancient pattern of Pyrrhonism, most scholars agree on its quite passive approach and

consequently on its lack of strong subjectivity. According to Myles Burnyeat (1983, p. 133), the attainment of *epokhe* was basically the result of a process of “detachment from the self,” the fruit of an “accentuated passivity” of sensations and thoughts, something like “a paralysis of reason by itself.” Jonathan Barnes has written that in ancient Pyrrhonists *epokhe* was a *pathos*, some sort of passivity or passion, that happened to the inquirers (*skeptikoi*) right at the end of their investigations. In other words, for the ancient Pyrrhonists, even the apex of their intellectual activity, namely suspension of judgment, was less a voluntary effort than the product of a causal sequence impacting on them (Barnes 1983, p. 7). Nearly the same can be said of Montaigne, with the aggravating circumstance that this latter added a sense of pessimism and human frailty unknown to the ancient sources. When one reads the *Essays*, it appears that skepticism inflicts a heavy blow not only to human arrogance but also to the value of the intellect. Not by chance, reason is defined as “an instrument of lead and wax, which one can lengthen, bend, and adapt to any direction and extent” (Montaigne 1999, p. 565).

From this point of view, Charron’s skepticism is quite different, as it depends on Stoic sources (especially for the autonomy of the sage) and relies more on neo-academic skepticism than on Pyrrhonism (Paganini 2009; Maia Neto 2016, pp. 11–39). First, the author of *La Sagesse* stresses the strength of reason, even though it does not have “jurisdiction” on all matters: for example, he proclaims that skepticism makes no metaphysical claims and that relies on revelation in theological issues. Nevertheless, in his own field, the sage shows full “universality of spirit”; he is not restricted by the “municipal law” (Charron 1986, p. 406) that rules closed systems of beliefs, whether these beliefs be the elementary, sociological beliefs of the village or the more sophisticated beliefs of nations, philosophical schools, religions (i.e., actual religious rites and behaviors), and churches. In the mundane domain of “human wisdom,” reason preserves its complete right “to judge about everything” and to “restrain assent” when faced with inadequate reasons (Charron 1986, p. 399).

Therefore, we can claim that Charron's philosophy is one of the places where a philosophical theory of the modern subject was born. This is the main Charronian achievement: *epokhe* or suspension of judgment becomes with him a vigorous and voluntary liberating move from a system of beliefs rather than an imponderable point of balance between different opinions, as it was before in the ancient idea of equipollence. For the first time in the modern age, the skeptic is someone who *fights* against an entire corpus of beliefs, someone who *decides to doubt* and *seeks* for arguments to this effect. Far from being the passive effect produced by the unresolved *diaphōnia* of appearances simply registered by the observer, Charron's art of doubting requires a conscious and voluntary decision from the subject. Skepticism demands a whole set of epistemic virtues that preserve the wise from precipitancy, prejudices, and mistakes. After Charron, the modern skeptic is someone who *wants* to cast into doubt almost everything whereas the ancient Pyrrhonist *was cast* in doubt by the discordance of different phenomena. With *La Sagesse*, one can see the author initiate the typical modern attitude of negative suspicion against any belief whose sole justification is habit, authority, or tradition. From passive, skepticism becomes active; it is no longer the position of an impartial observer but the pose of a conscious protagonist that does not want to be enslaved to prejudices or opinions devoid of any rational justification (Popkin 1954; Popkin 2003, pp. 57–63, 68–70, 100–107).

Impact and Legacy

Reappraisal of Skepticism: Campanella. Histories of skepticism are now much wider in scope and include not only the effects of this philosophical movement but also reactions to it. However, there was until recently a huge gap, as the work of Tommaso Campanella in this field was ignored or neglected (only a few lines in Popkin 2003, p. 126), although the Italian philosopher dedicated the whole of the first book of his *Metaphysica* or *Universalis philosophia* to a detailed analysis and confutation of skeptical doubts. Now this gap is

filled by an in-depth analysis (Paganini 2009, pp. 101–170). In the Inquisition's prison Campanella wrote and rewrote the work many times, first in 1602, then in 1611 and 1624, and only in 1638 was the work finally published in its entirety in Paris. It is without question one of the seventeenth century's largest studies of the problem of skepticism, even though neither the publication of Sextus Empiricus' works nor the renaissance of Pyrrhonism seems to have influenced it (Paganini 2006; Paganini 2009, pp. 275–304). Basically, Campanella's text is a critical analysis of Aristotelian epistemology and the demonstration that this theory leads to a skeptical impasse as it is based on an idea of scientific knowledge completely unattainable by human beings. The central topic in fact is "the question of whether science exists and how limited and partial it is to an extent realized only by those who know that they do not know anything perfectly and completely" (Campanella 1994, p. 42). Campanella spends a large part of the beginning of the first book of *Metaphysica* reviewing the 14 *dubitaciones* of the skeptics. This may be the first and the largest sylloge written in the seventeenth century on this topic as it was composed prior to Gassendi's and Mersenne's analogous writings and earlier than Descartes' *Discourse on method*.

In Campanella's book I one can find many of the "commonplaces" of ancient and modern skepticism, renewed by Sanches and Montaigne, even if the author does not seem to know their works. Sense only grasps the "surface," the "accidents" or "effects" of things, whereas the "inner parts" ("interiora"), the "substance," and the essence ("quidditas") remain unknown to us (Campanella 1994, pp. 46–48). Each person knows things differently depending on how it is affected ("alius aliter afficitur"). What we do know, we only know "according to our measure and not according the measure of being and truth" (Campanella 1994, p. 50). Campanella further developed these arguments, which were particularly challenging for an author who had made sense the principle and verification of every type of knowledge, in a sort of crescendo during the third *dubitatio*, where he shows that the skeptics

do not even believe that partial and superficial knowledge is really possible, because “no sense perceives things as they are, but in the way in which that sense is affected” (Campanella 1994, pp. 74–75) and, since sensations lie at the base of the entire edifice of knowledge, each person ends up by having “his or her own philosophy that depends on the perception of his or her senses” (Campanella 1994, p. 86). It is a short step from there to confronting the sensory endowment of one man with others, but also men with animals. The obvious consequence is that beasts must be superior to us and, even if man is better-tempered, this is again relatively true, only for us and not for Nature (Campanella 1994, p. 88, 90–92). The author of *Metaphysica* pays particular attention to Plato’s *Theaetetus* in which the problematic and uncertain character of sensible knowledge is emphasized (Campanella 1994, pp. 100–102). From this dialogue Campanella only takes the *pars destruens*, namely the demolition of the value of sensible knowledge, whereas he rejects Socrates’ attempt to subtract those unalterable and ideal aspects, which alone would have enabled us to construct a certain science, from the universal change that affects sensible knowledge. Even though it differed from Platonism, Aristotelian epistemology, too, was grounded on permanent aspects, as “the species and the whole, rather than on matter and the single parts.” The obvious consequence for the Stagirite was that “science is about species” rather than individual entities. To this abstractionist point of view, Campanella reacts together with the skeptics, as Sanches already did. He confirms the need for a kind of knowledge that must attain concrete and individual things and denounces the Aristotelian science of the universal: “it is not wisdom but a confused, common and external one, which does not attain the inside of the thing” (Campanella 1994, p. 108). To the model of knowledge by abstraction, the second *dubitatio* opposes – to declare it unattainable – a kind of “total” knowledge that cannot be reduced to “the common things, without peculiarities,” on the example of God’s knowledge that reaches all the “peculiarities.” Campanella thinks in conformity with the theses of radical nominalism according to which

“universals exist only in particulars.” But precisely for this reason the reevaluation of the particular would lead to the skeptical heavy blow since in that hypothesis “in order to know something, which is impossible, we would need to know infinite things and the perishable ones too, which nobody can know” (Campanella 1994, p. 52).

The pre-Pyrrhonian character, in all senses, of Campanella’s discourse is striking. Several decades after the publication of Sextus Empiricus’ works, he appears not to be familiar with the peculiarities of this kind of skepticism. He speaks generically of “skeptics,” without differentiating between Pyrrhonists and Academics (Campanella 1994, p. 108), and throughout the first book he never names Pyrrho and only once mentions Sextus Empiricus, correctly distinguishing his position from the negative dogmatism of Socrates and Arcesilaus. Although *Metaphysica* contains an echo of the *leit-motiv* of the *diaphonia* among philosophical opinions, other more technical arguments, typical of Sextus, are missing, such as the aporia of the “criterion,” the figures of “dialleles,” and “regression to infinity.” There is only one passage in this Book I in which Campanella appears to evoke the argument of regression to the infinite; however, it is clear that Sextus is not the source of the argument as Campanella refers it to the typically Scholastic notion of “species” (Campanella 1994, p. 120).

In some interesting pages, Campanella looks at a number of arguments that, though already present in Cicero, were to enjoy new and better fortune after Descartes returned to them in *Discours de la méthode*. He examines the doubt between dreaming and waking and the comparison between wisdom and madness, to which he adds the more dramatic doubt on life and death, taken from Euripides (Campanella 1994, p. 126, 132). These themes, however, are amplified to the maximum in *Metaphysica* and thus take on a particular significance deriving from the principle (entirely due to Campanella) that knowledge is “passio” since in it a true transmutation takes place: “the knower is transformed into what is known; therefore to know is tantamount to an alienation.” It is not by chance that the theme of

human “delirium” was to return again in *dubitaciones* XI, XII, and XIII: “the fact that we sleep, that we rave, that we are in the shadow of death” can be deduced from many signs, first and foremost from the recognition of philosophical “ravings” (Campanella 1994, p. 138, 146), but also from the equally foolish contrasts surrounding the doctrine of “principles” including the foundations of morality and religion. The pages that Campanella dedicates to this latter, particularly treacherous theme provide a nice summary of the arguments produced by ethical skepticism (including ideas from Carneades already mentioned in Grotius’s *Prolegomena*), whereas his lively notes on the disparity among religions and on their strange beliefs appear to echo the famous darts shot by the libertines and the early deists, who had taken a lesson of disenchanted skepticism from theological conflicts, as he had described them in his *Atheismus triumphatus* (Campanella 2004, pp. 18, 33, 77–84, 92).

Skepticism, philosophy of mind, and reform of metaphysics. Other important metaphors flow from Platonic readings. The soul imprisoned in the body, locked up “like a craftsman in a dark cave” (Campanella 1994, p. 134), recalls the famous myth of Plato’s *Republic* (“as if we were placed in a cave so that we might see only the shadows of the things that flow”). The reference to “Platonists and Augustine” teaches that “all things we see are images of other real things that exist in the angelic world and in God” (Campanella 1994, p. 104). All these themes are spread across Campanella’s pages and clearly reveal something of the metaphysical background that underlies the skeptical *dubitaciones*. The frequent references to the Socratic model, with its wisdom of “knowing that one knows nothing,” serve to strengthen his much more Platonic than Pyrrhonian plot. However, Campanella does not seem inclined to take up the antiskeptical strategy that Socrates adopted in the *Theaetetus*. Rather, the author of the *Metaphysica* opposes the Platonic pretense of attaining the “stable and intelligible kind,” using the “reason” that has “science” as its aim, the primordial character of sense which even reason cannot ignore or give up: “No sane person will say that science begins from intellect. Science begins from

sense; therefore one needs to philosophize from sense as the Creator of things established.” While skepticism has good arguments to stress the boundaries and uncertainties of sense, Platonism is wrong in going further and denying that sensible knowledge is necessary, since there is no doubt that “the intellect does not know anything if not starting from sense” (Campanella 1994, pp. 122–124).

The author of the *Metaphysica*, on the other hand, finds his way out of this condition of uncertainty through his metaphysical and psychological program. He supplements sensationalism with the idea that any entity, and in particular the soul-*spiritus*, *sapit*, that is it has “taste” and “knowledge” of itself. As the tendency to self-preservation is innate in any being, so there must exist in us a latent faculty (“notitia indita et abdita”: “innate and hidden notice”) through which we can grasp ourselves in the interior: “The being of the soul, as of any other subject that knows, is self-knowledge” (Campanella 1638, II, p. 64).

If we examine the final part of Book I, which contains detailed replies to all the *dubitaciones*, it is clear that, in each reply, Campanella takes hold of various aspects of skepticism, correcting and integrating them into a positive and constructive view of human knowledge: a limited view of course, but it is one that is effective and adequate within its own framework. Right from his first reply, Campanella stresses both the partiality and the operative nature of knowledge: human science is “nothing compared to what has been said about it, but it is something in itself providing enough for human life.” Even when it is limited to sensible things, we still may go a little further and say that knowledge at least grasps the essence (“quidditas”) “for those things that of themselves move sense, such as heat, cold, light” (Campanella 1994, pp. 406–408).

Doubt III encapsulates another important truth: everyone suffers in different ways, but we may be equally certain that the interaction between objects and sentient beings is a reality. Whereas the skeptic stubbornly insists on an impossible objectivity or neutrality, the metaphysician, on the contrary, comes to terms with reality: “it is useless to blame the senses for the fact that they do

not perceive except thus. Nor can the nature of things be blamed for the fact that they are not capable of presenting themselves only thus to those senses" (Campanella 1994, p. 424). This "science suited to us" ("scientia secundum nos") will certainly be "slight and weak" ("modica et exilis"), as the author repeatedly stresses. Nevertheless, it will make available a precise confirmation of reality. If we determine the factors that cause appearance to vary, even that variation will lend itself to verification and correction, following the principle that "although the senses err in many things, they nevertheless correct themselves through other sensations" (Campanella 1994, p. 422).

The discourse on the "delirium of philosophers" (the subject of doubt XI) places positive stress on the ideal of "libertas philosophandi," the capability, that is, to philosophize "with an altogether free mind," fixing our gaze on the "divine code" and not on the "human schools" (Campanella 1994, p. 466). The reply to the doubt XII (that concerning the "deliriums about the principles of things") not only stresses the need for an examination that is not prejudiced by Aristotle's authority or by that of any other philosopher (Campanella 1994, p. 470), but also states Campanella's intention to rebuild the edifice of knowledge completely. He adds a defense of the different branches into which it is subdivided: metaphysics, logic, mathematics (which also includes astronomy and astrology), physiology, morality, politics, and religion (Campanella 1994, pp. 474–518).

Ernst Cassirer, who recognized in Campanella's work "a complete theory of skepticism," believed skepticism to be the result of the "conflict" between sensualist Telesian gnoseology and Platonic-Augustinian metaphysics, centered around the doctrine of ideas and of primalities of being, which integrates and corrects the former without ever achieving a true fusion with it (Cassirer 1922, pp. 240–257). The fact that the "innate notion" ("notitia indita") is never thrown into doubt, not even in the most radical *dubitaciones*, tends to confirm this evaluation. A contemporary of Gassendi and Mersenne, Campanella is not a "mitigated or constructive

skeptic," in the *scientific* meaning that Popkin gave this qualification (Popkin 2003, p. 112 ff.), despite his appeal to be satisfied with a "slight and weak science." In fact, the author of *Universalis philosophia* wants to go far beyond the horizons of physics and natural phenomena to include into knowledge the area of metaphysics. The "metaphysical" skeptic of his *dubitaciones* does indeed correct Platonism with sensualism, but at the same time he opens the door to a new kind of research that heads in another more ambitious direction: he moves from sensible data to derive judgments, and then reaches "reason" ("ratio") that, as he warns, "is not an abstract being" ("non est ens rationis") (Campanella 1638, I, p. 344).

The necessity of doubt. This new perspective paves the way to the properly metaphysical parts of *Universalis philosophia*, with its theory of the three primalities of being. Although Campanella assimilated skeptical instances in his gnoseology, he thought they could be overcome by turning to a platonico-augustinian theory of reason and ideas. Nevertheless, skepticism still plays a major role for him and cannot be simply dismissed. With his doubts, the skeptic brings to light truths that the simple empiricist ignores: he questions sensible knowledge and so helps reach a higher level of certainty, which is provided by metaphysical reason. Furthermore, as he always aims at realizing a synthesis of sensualism and intellectualism, metaphysics and empiricism can correct each other. This explains all his disdain for Aristotle's abstractionist epistemology or for the pure idealism of Plato, which are in the end rejected, like the objections of the skeptic. In fact, skepticism is for Campanella only a preliminary, but necessary, stage to be overcome in his reform of metaphysics that would include also sciences, which are still in need of a deeper philosophical foundation than that could be afforded by simple "mitigated skepticism."

Unfortunately, Descartes refused to read Campanella's *Universalis philosophia*, which Mersenne proposed to send him right after its publication in 1638. He already knew *De sensu rerum et magia* and was negatively struck by the sensualism contained in this work. However, if he had read *Metaphysica*, he would probably have

changed his negative opinion about the philosophy of the Italian author and possibly he would have appreciated both the foundational role assigned to skepticism and the attempt to overcome it by a new kind of metaphysics, even if Descartes' was to be more scientific and definitely dualistic (Paganini 2017). On the other hand, Campanella's major work had a hidden posterity even in France, in the Cartesian inner circle. In fact, Mersenne read *Metaphysica* when it was still in manuscript; what is worse, he plagiarized some significant portions of the first book on skepticism, in order to build the character of the "Pyrrhonian" in his *La Vérité des sciences* (Mersenne 1625; see Paganini 2005; Paganini 2008, pp. 129–170).

Interconnections

Descartes and the Renaissance skeptics. To what extent could Descartes's doubt and its solution (Popkin 2003, pp. 143–173; Paganini 2008, pp. 229–348) be influenced by the Renaissance revival of skepticism with all its innovations? To understand Cartesian doubt and its developments, it is essential to make two fundamental moves: (a) first, to shift the focus from the ancient sources, which mostly monopolized scholars' attention, and to consider instead Renaissance philosophers and seventeenth-century free-thinkers, which not only were closer to him but also transformed skeptical issues in-depth (Paganini 2008b); (b) secondly, to extend the range of the sources from the Pyrrhonian ones, basically Montaigne (Brunschvicg 1945; Panichi and Spallanzani 2013) to authors that were more eclectic, like Charron, or more involved with the new Academy, like Sanches. Today it is no longer possible to share Gilson's negative judgment on "philosophers of the Renaissance that were engaged in doubting," who failed because of their basic empiricism (Gilson 1967, p. 288). In fact, as we already saw, the skeptical positions of these philosophers brought forth new themes that went far beyond their original empiricist or sensualist culture. While Stoicism supported the autonomy of the sage in Charron and developed into a new

skeptical theory of the active subject, contributing to provide Descartes with "a skeptical base" for his *cogito* (Popkin 1954; Maia Neto 2003; Maia Neto 2016, pp. 97–123), the debate about certainty of the internal states of the mind deeply influenced Sanches and was taken up again by Descartes. On both of these sides, late Renaissance skepticism recovered a strong theory of subjectivity that was lacking in ancient Pyrrhonism and was put in practice, but not theorized in a due philosophical form, by Montaigne. In this way, modern and especially Renaissance skeptical themes were conveyed into Descartes's re-discovery of the self and its certainties.

Descartes and Sanches. Let us start with Sanches' case which is still less known. We shall focus on what one can find both in Sanches and in Descartes, and only in both of them, to determine which was the influence of the former on the latter. First, we can find in Sanches' work the feeling of a very personal experience, as later in Descartes's *Discours de la méthode*, an experience that reveals right from the start a strong need to return from words to things, from *verba* to *res*, even though in both thinkers, it ends up yielding a deep disappointment regarding the state of knowledge of their time.

If we leave aside the tragic tones adopted by Sanches, for example when he evokes the dramatic experience of the labyrinth and compares the skeptical checkmate with the encounter with the Minotaur, on the whole we can see that his considerations concerning the variety of things, the multitude and confusion of opinions, stand directly against the background of the *Discours*, where Descartes describes his despairing itinerary through "la diversité de nos opinions." Similarly, the sense of fallibility that strikes perceptions and extends to the mind, bringing about a condition of total uncertainty in the form of a true deception, cannot but evoke Descartes's suspicious approach adopted in the *Discours*, where he attempts to liberate the mind from all its prejudices "faisant particulièrement réflexion, en chaque matiere, sur ce qui la pouvait rendre suspecte, et nous donner occasion de nous méprendre" (Descartes 1964 ff., AT VI, p. 28). Reading *Quod nihil scitur*, Descartes realised the need of freeing his intellectual

power from any kind of authority, but at the same time he saw the failure of empiricism as it ended in scepticism. In the related passages, Sanches' procedure is in fact the proof *e contrario* of the value of an anti-empiricist prospective. While for Sanches it is true that we cannot usually do without knowledge of senses, it is actually no less true, for him, that just for this reason, the most complete uncertainty falls on knowledge of the whole ("Nil certius sensu: nil eodem fallacius"), until it precipitates into complete doubt. Many of the formulae adopted in *Quod nihil scitur* (for instance, "Nulla conclusio. Perpetua dubitatio. Omnia dubia esse") are particularly close, both in substance and in expression, to analogous considerations in Descartes' *Discours*, and that is even truer for the *Recherche de la vérité*, in particular for the statement of "universal doubt."

One might extend the comparison of Descartes with Sanches (Paganini 2009b) into more details, in particular to the need for the method of doubt, to the difficulty of using it, and to the fact that few are able to practice it. The differences between the achievements of different men mainly derive from the same causes for both authors. Analogously, on another front, Sanches, like Descartes, holds that one should reject authorities to follow only reason. In the first place, this is because it is difficult to choose one among those on the market, but, more than that, because in relying on others' opinions, the disciple becomes "a slave rather than a learned man." Descartes will say the same in a famous passage about the impossibility of sticking to one opinion once one starts meeting different teachers and becomes acquainted with different opinions and customs without thinking them barbaric. This passage is not only a repetition of Enesidemus' tenth trope; it flows from a well-defined literary model already established by Sanches when he describes the loneliness of the disciple who cannot appeal to the judgment of others when searching for the truth.

Telling the story of doubt. In fact, apart from the contents, Descartes appears to have taken the very form of the story told in the *Discours* from Sanches. Although *Quod nihil scitur* is not organized as an autobiography like the first parts of *Discours*, it is nevertheless built in such a way as

to describe the personal experience of an intellectual journey through the false certainties of an entire culture until its failures are unmasked. Most of *Quod nihil scitur* is written in the first person singular, and even when the author debates fiercely with a second person, it is more an internal discourse, a dramatic monologue with himself, than a true dialogue with another character. The account of a knowledge crisis is on the whole the same idea that governs the first four parts of the *Discours*, and reference to a literary model such as Sanches' work might solve the big problem that Cartesian scholars dwell upon when interpreting the *Discours*. All its commentators have stressed the highly personal nature of what Descartes describes as "l'histoire de ma vie"; but they have also been divided on the question of whether the story faithfully relates the opinions the young Descartes really harbored at that time. It does indeed seem highly improbable that, when attending the Collège de La Flèche (1606–1614, and so between the ages of 10 and 18) the young student would have been able to judge the pillars of his own learning so severely as related in *Discours*. It is much more likely that, when writing this work, Descartes reorganized and rebuilt his own autobiographical recollections, shaping them into a scheme that could have more easily been provided by a work like *Quod nihil scitur* than by Montaigne's *Apologie* or Le Vayer's skeptical dialogues. Indeed, the former was not written as a recollection of a personal experience and the latter, due to their explicit dialogic form, are very distant from an account told in the first person, as in Descartes. It was most probably Sanches' booklet that suggested Descartes the format to tell an epistemological crisis as a personal experience, even though the *Discours* is soberer and drier than his antecedent.

Beyond doubt: the internal states of the mind. Similarly, the constructive aspect of Sanches' work, namely his theory of the certainty of the internal states of the mind, can be related to the similar doctrine in Descartes. To appreciate the tight connection, one should note that Sanches' description of the epistemological certainty of internal states ("quae in nobis aut sunt, aut a nobis fiunt," see above) will reappear almost

literally the same in a passage of Descartes, where he defines the “cogitations” as “everything that happens / is made in us” (“omnia quae in nobis fiunt”), adding the claim that thoughts “taken in themselves and not referring to something else, cannot be considered false, if one speaks properly” (Descartes, *Principia philosophiae* I, 9 AT VIII A, p. 7; cf. *Meditationes* II AT VII, p. 33; *I^{ae} Responsiones* AT VII, p. 107; *IV^{ae} Responsiones* AT VII, p. 246). There is therefore quite a strong reason to see in this doctrine of the internal states of the mind a skeptical “antecedent” of Descartes’ thesis that the mind is transparent and that ideas are evident when considered in themselves. Distinguishing between internal and external states and explaining how it is possible to acquire much knowledge without going outside of oneself, Sanches’ discourse actually opened the path to an investigation in the direction Descartes will look for in the *Meditations* and *Recherche de la vérité*. To use Poliandre’s words in the last reply of this unfinished dialogue: “There are so many things in the idea of a thinking being that to develop them all we would need whole days” (Descartes, *Recherche de la vérité* AT X, p. 527). Obviously, Descartes’ different metaphysical attitude allows him to assign a foundational value to certainties that for Sanches were very strong in certainty but, on the opposite, very poor in comprehension. Whereas the inverse proportion between these two factors prevents the skeptic from proceeding further in the achievement of metaphysical knowledge, so that his distinction between things “inside” and “outside” stops at a dead-end, Descartes could profit instead from Sanches’ discovery of interiority to overthrow skepticism, as it were, from inside, digging into this sphere of internal and autonomous knowledge. In so doing, he exactly obtained what the skeptical crisis required in order not to be accused of preconceived dogmatism. Moreover, while Montaigne had no philosophical theory of the self but rather an experienced and literary practice of it (Paganini 2013), while self-awareness has in Charron mainly a moral import, Sanches goes straight to the issue of the metaphysical certainty: this is his constructive aspect that was often neglected by readers and is yet crucial for his

connection with Descartes. More than Montaigne, Charron, and Campanella, it is Sanches the real link between Descartes’ experience of doubt and the skeptical Renaissance thinkers. What is even more important, looking at Sanches, this connection regarded not only the destruction of false certainties but also the discovery of the true ones by the French philosopher.

Skepticism in the Renaissance: Short Overview

Charles E. Snyder

Maimonides Centre for Advanced Studies,
Universität Hamburg, Hamburg, Germany

Abstract

Philosophical skepticism takes two distinct forms in the ancient Greek and Roman tradition, but only one of those forms has an afterlife in the Renaissance. Renaissance skepticism refers primarily to the revitalization of dogmatic skeptical argumentation in the service of religious truth, on the one hand, and the disavowal of a less assertive form of classical skepticism, on the other. Ancient philosophical skepticism inspired Renaissance thinkers who had already accepted religious truth on the basis of a fundamental faith in divine revelation, including Jewish rabbis preaching in Italy and Christian authors battling scholastic Aristotelianism in France. Ancient skeptical argumentation became grist for the religious mill of proclaiming the superiority of religious truth over the doctrines of philosophy.

Heritage and Rupture with the Tradition

Classical skeptics adhere to the belief that for human beings nothing can be known for certain, and the belief that one should suspend belief, even the belief that nothing can be known for certain. Sextus Empiricus' brand of classical skepticism invokes the example of Pyrrho and the goal of psychological tranquility and moderate feeling to profile the practical life of classical skepticism. By contrast, dogmatic skeptics are resolute in arguing for the belief that nothing can be known for certain. This second form of skepticism adheres more firmly to the belief that nothing can be known for certain, and that one should withhold belief. In arguing for these beliefs, dogmatic skeptics give assent to the framework of criteria and notions that dogmatic philosophers rely on to make

positive claims. Metrodorus of Stratonicea and Philo of Larissa, disciples of Clitomachus in the late Hellenistic Academy, broke ranks with the classical skepticism that held sway in the Academy from Arcesilaus to Clitomachus. Metrodorus and Philo believed firmly in the view that certain beliefs are more persuasive, beliefs which now enable the dogmatic skeptic to argue more stridently for the view that nothing can be known for certain. Thus traces of classical skepticism survive in Cicero's *Academica*. But in that work, Cicero devotes considerable effort to defending the dogmatic skepticism of the late Hellenistic Academy. Sextus' classical skepticism sanctions a mitigated and less assertive mode of belief according to which the skeptic lives an ordinary life and evades the framework of notions and criteria affirmed by dogmatic philosophers. It was as customary for philosophers in late antiquity and beyond to dismiss this way of life as untenable as it was for later religious thinkers to disavow it almost entirely, for the ordinary life of the Pyrrhonist does not seem readily reconcilable with the authoritative proclamations of truth according to divine revelation. In addition to Cicero and Sextus, the writings of Philo Judaeus, Plutarch, Galen, Aulus Gellius, Diogenes Laertius, and early Christian authors like Lactantius, Jerome, Augustine, Eusebius, and Photius should not be forgotten as indirect sources of ancient skeptical argumentation, but the textual remains of classical skepticism proved difficult for Renaissance thinkers to extract from later testimonies. Familiar with many of these ancient sources, the philologically trained Spanish humanist Pedro de Valencia (1555–1620) illustrates the difficulty. Valencia published in 1596 his *Academica sive de iudicio erga verum, ex ipsis primis fontibus*, perhaps the most probing and impartial historical exposition of ancient skepticism by a Renaissance thinker. But even Valencia is prone to ignore the subtle difference between classical and dogmatic skepticism in antiquity, judging academic skepticism in general to be a means to the realization that God is the sole source of truth.

Humanists and religious thinkers in the fifteenth and sixteenth centuries exploited the polemical zeal of dogmatic skepticism but paid no mind to the less assertive form of classical skepticism present in

Cicero and reported by Sextus. Friends and enemies of ancient philosophical skepticism transformed the remains of philosophical skepticism into dogmatic skepticism. Desiderius Erasmus' *In Praise of Folly* may be a curious exception, with his mild acclaim of classical Academic skepticism for not asserting anything. Despite the rediscovery of the polemical power of dogmatic skepticism during the Renaissance period, the appropriations of religious skepticism in the Renaissance had no more use for classical skepticism and the psychological state of tranquility than the philosophers and theologians of late antiquity and the Medieval period (Frede 1984).

Innovative and Original Aspects

A Dominican monk teaching philosophy in Florence, Girolamo Savonarola (1452–1498) understood the critical potency of the arguments contained in the extant manuscripts of Sextus Empiricus for the rejection of Aristotelian philosophy and the reform of the Catholic Church. Savonarola chose not to learn Greek, and thus had not read Sextus Empiricus himself. And yet he had enough sense of those writings to recommend them as part of a campaign against the dominant pagan philosophies of his time (Floridi 2002). He encouraged the translation and study of Sextus as a means of submitting oneself to the superiority of the Christian faith.

His disciple Gianfrancesco Pico della Mirandola (1469–1533) composed in 1520 his *Examen vanitatis doctrinae gentium et veritatis christianae disciplinae*, an attack upon Aristotle's epistemology and pagan philosophy more generally with the help of arguments from Sextus' works (Schmitt 1972; Cao 2007). Pyrrhonian skepticism is worthy of Pico's attention insofar as the skeptic is a credible witness in the prosecution of philosophy in the service of divine revelation. Gianfrancesco was not intrigued by the end of the practicality of Pyrrhonian skepticism. The same can be said for Henricus Cornelius Agrippa von Nettesheim (1468–1535), whose *De Incertitudine et vanitate scientiarum et atrium, atque excellentia Verbi Dei, declamatio inactiva*

(Agrippa 1530) criticizes all the human arts and sciences as unreliable and immoral, for he considered it much better to believe in the revelation of God and the Church of Jesus Christ.

The Mantuan Rabbi Judah ben Moscato (1533–1590) published in Venice a collection of 52 sermons titled *Nefuṣot Yehudah*, addressing an assortment of theological and philosophical topics from the perspective of the Jewish rabbinical tradition. Moscato's ideas range across non-Jewish sources, including Greek and Roman mythology, Neo-Platonic philosophy, and the classical philosophy of Heraclitus. In preaching that the human arts and sciences, including geometry, arithmetic, and metaphysics, consist of only partial truth, Moscato deploys the denials and negations of dogmatic skepticism, though it remains unclear whether, or to what extent, Moscato borrowed indirectly or directly from Cicero, Sextus, or later sources for an understanding of ancient skepticism. Nonetheless, in reserving perfect knowledge for those who study the Torah, Moscato's religious skepticism resumes the negative aspect of dogmatic skepticism to prepare the way for the positive truth-claims he does make on the basis of the Torah.

In 1562, Henricus Stephanus (Henri Estienne 1528–1598) published the first Latin translation of Sextus Empiricus' *Pyrrhoneioi hypotyposeis*, and in 1569, it was republished along with a Latin translation of *Adversus Mathematicos* by the Catholic Priest Gentianus Hervetus (1499–1584). The Latin translations had an immediate impact, especially in France, where Cicero's works already had a significant role in the controversies concerning scholastic pedagogy (Schmitt 1972).

The physician and philosopher Francisco Sanches (1551–1623) was reputed to be a skeptic in his own day. Pierre Bayle praised Sanches as a "grand Pyrrhonian," but today most scholars agree that Sanches had not been familiar with Sextus' writings (though he was certainly familiar with Diogenes' *Lives*). Scholars typically describe his 1581 *Quod nihil scitur* as the work of an Academic skeptic (Limbrick 1988, Popkin 2003), as it challenges the dogmatic claims of scholastic Aristotelianism, and to an extent Platonic philosophy. The very first words of *Quod*

nihil scitur, "Not even this one thing I know, namely that I know nothing," alerts readers not to expect arguments or claims that establish that nothing can be known. If Sanches had been an Academic skeptic, it was not the later dogmatic skepticism of Metrodorus, Philo, and Cicero (Caluouri 2007). In a letter to the Renaissance mathematician and astronomer, Sanches signs *Carneades philosophus*, making it seem as if Sanches was more inclined to revive the classical skepticism of Carneades' Academy, especially since he had no apparent interest in the Pyrrhonian goal of tranquility (*ataraxia*) or moderation in feeling (*metriopatheia*). As a Catholic, however, Sanches asserted the truth of divine Revelation and thus had strong beliefs about the aim of human life. Classical skepticism of the Academic variety, of course, refrained from such an assertion.

Michel de Montaigne's "Apologie de Raimund Sebond" (1580) is the most far-reaching appropriation of ancient skepticism in the Renaissance. Montaigne complies with his father's request to translate Raimund Sebond's *Natural Theology* and defends his theology in his longest and most skeptical essay. Despite having never read Sextus in Greek, Montaigne relied on Pyrrhonian tropes to attack the vanity of human reason "to make room for faith" (II.12, F375, V506). But in his ironic praise of Pyrrhonian skepticism (II.12, F422, V561), Montaigne appeals to a criterion favored only by dogmatic skeptics of the Academy, a signal to his more astute readers that his essays deliberately make a mongrel of classical and dogmatic skepticism. And yet, the "Apologie" concludes with a judgment much more characteristic of Sebond than classical or dogmatic skeptics, asserting that only faith may elevate humanity to a position of communicating with the divine. While Montaigne appeals to the dogmatic skepticism of Cicero in putting forth the criterion of the *probable*, Montaigne's "Apologie" reflects a harmonization of Christian faith and a notion of human reason expunged of its predilection for conceit and ultimate authority.

Writing in a more traditional style, the Catholic priest and theological advisor Pierre Charron developed in *De la Sagesse* (1601) a systematic

account of skeptical wisdom inspired mainly by Montaigne. Another important influence on Charron was Omer Talon (ca. 510–1562), the colleague of Petrus Ramus in Paris who wrote an influential commentary and introduction to Cicero's *Academica* in 1547 and Cicero's *de Oratore* in 1553. Ramus was accused of being a “new Academic” for his attempt to reform university pedagogy with the help of Talon, turning it away from scholastic Aristotelianism toward Academic skepticism and Ramism. Like Talon and Montaigne, Pierre Charron embraces the dogmatic skepticism of the Academy in arguing for the limited perfectibility of human reason based on a knowledge of human nature. The skeptical sage makes discoveries about what human reason cannot attain. Charron's skeptical wisdom reinforces religious truth through the positive acceptance of faith.

Simone Luzzatto (1583–1663), a Venetian rabbi proficient in mathematics and astronomy, published in Italian his *Socrate overo dell'humano sapere* in 1651. The work remains largely unstudied by Renaissance scholars today. Writing as the chief rabbi of Venice, Luzzatto seems to compose *Socrate* for a readership wider than his Jewish community. Luzzatto deploys a semihistorical Socrates in making a critique of his own scientific and cultural milieu, with extended commentary on the current sciences of the natural world, from observations in the field of optics to Galileo's studies of the moon and planets. While Socrates defends himself against the charge of subverting the human sciences, he identifies himself as a seeker of *probable* knowledge. In the end, Socrates renounces the pursuit of certain knowledge in light of the endless controversies in the natural sciences, but his belief in the certainty of divine revelation seems immune to Luzzatto's theologically motivated skepticism (Veltri 2011).

Impact and Legacy

Modern philosophy may have benefitted from a more accurate historical understanding of ancient Greek skepticism. Philosophers like Descartes and Hume reduced ancient skepticism to the

question of how impressions and ideas given to us could yield any *certain* knowledge about how things are. Descartes sought an answer to this question and reinvigorated the demand for the kind of certainty characteristic of ancient Stoicism, accepting the dogmatic framework of Hellenistic epistemology, as if classical skeptics had not already warned philosophers and dogmatic skeptics against this very framework. Hume may have found support for his tendency to evade the framework of dogmatic epistemology in the practical life of classical skeptics, but his understanding of ancient skepticism is for the most part reducible to dogmatic skepticism. In presenting modified versions of skepticism and seeking limited certainty, the Catholic priest and philosopher Pierre Gassendi, who had relied to a degree on the work of Sanches, may also have profited from the effort of classical skeptics to resist the kind of certainty idealized by other Hellenistic philosophers. The same could be said of Marin Mersenne, who sought to formulate a notion of knowledge independent of the criterion of cognitive certainty, anticipating what would become a criterion much more amenable to the modern natural sciences.

Skinner, Quentin

Born: 26 November 1940, Oldham, Lancashire, England (United Kingdom)

Dustin Garlitz

Department of Philosophy, University of South Florida, Tampa, FL, USA

Abstract

This entry focuses on the Renaissance philosophy scholarship of English historian of political thought Quentin Skinner. The work of Skinner's Renaissance political philosophy is highlighted. An effort is made to identify Skinner's key themes in Renaissance philosophy scholarship, including the leading philosophers he studies from the time period and the tradition that he departs from in the historical reception of scholarship in the field. All of Skinner's major book-length contributions to Renaissance philosophy are noted, including his edited works in this area.

Biography

Quentin Skinner (born 1940) is an English historian. His most noted work has been in intellectual history and the history of political thought. He was one of the founding figures of the Cambridge school of the history of political thought, while he was a professor at Cambridge University. He served as Cambridge University's Faculty of History's Regius Professor of Modern History. He was educated at Gonville and Caius College, Cambridge. Immediately after becoming a fellow there in 1962, he was made a fellow at Christ's College, Cambridge. Skinner is currently Barber Beaumont Professor of the Humanities at Queen Mary, University of London. He moved there from Cambridge in 2008.

Works and Themes

Skinner is a leading historian of Renaissance philosophy, especially political thought from the Renaissance. Skinner has published work on early Renaissance political painting. His notable contributions to Renaissance political philosophy include *Visions of Politics* (Skinner 2004) and *The Foundations of Modern Political Thought* (Skinner 1978). He edits the book series *Cambridge Texts in the History of Political Thought* for the Cambridge University Press and has edited a volume containing Machiavelli's *The Prince* (Skinner 1981) in that book series. Among Renaissance philosophy, Skinner has in fact been most interested in researching Machiavelli, namely his notion of republicanism. He coedited *The Cambridge History of Renaissance Philosophy* (Schmitt, Skinner et al. 2008) with other Renaissance philosophy scholars, in which he focused his scholarship for the volume on Renaissance political philosophy. Volume two of *Visions of Politics: Renaissance Virtues* (Skinner 2004) features Skinner's research essays on Machiavelli, Ambrogio Lorenzetti, Thomas More's *Utopia*, Renaissance constitutional thought, humanism, scholasticism, popular sovereignty, virtuous

government, republican values and virtues, liberty, and translation. Volume one of *The Foundations of Modern Political Thought* (Skinner 1978) features Skinner's scholarship on liberty, rhetoric, scholasticism, the Florentine (Italian) Renaissance, and the Northern Renaissance. In Skinner's writing on liberty, he studies the various city republics of Renaissance Italy. These city republics are juxtaposed with the Empire from the period, and with the Papacy. In the rise of rhetoric and liberty in the Renaissance, Skinner focuses on the emergence of despots from the era. Skinner has been interested in Republican liberty throughout his various works on the history of political thought, and traces the Republican liberty of early modern political philosophers such as Thomas Hobbes back to Renaissance philosophy.

Heritage and Rupture with the Tradition

Skinner finds a diminished sense of Republican liberty in Renaissance philosophy beginning in the thirteenth century, due to the class divisions that started to develop then in Renaissance Italy and its various city-states. Accordingly, Skinner studies Republican civic life from this period and location and has built on the work of Renaissance historian Hans Baron in this regard. Italian universities are studied by Skinner in an effort to demonstrate how the study of rhetoric from the period gave rise to political ideology. He identifies the humanism that emerged from such a study of rhetoric and builds on the work of Renaissance philosopher Paul Oskar Kristeller in making that identification. At this juncture, Skinner seeks a connection between the humanism of Renaissance Italy and that of French academic culture. In his work on the Italian portion of this divide, Skinner focuses on the work of Dante, including his *The Divine Comedy*. Skinner then moves to identify the reception of Scholasticism there and emphasizes that before Scholasticism there was humanism. On such a matter, Skinner emphasizes humanism's role in the larger educational tradition of the

liberal arts, including the trivium. He finds that the sources of scholasticism from the time period were traced mainly to the rediscovery of Aristotle's philosophical works, including his *Nicomachean Ethics* and his *Politics*, and that in time these texts of his appeared increasingly less threatening to the political and moral theory of Augustinian commentators.

Slaves, Slavery in the Renaissance

Juliane Schiel

Institute for Economic and Social History (WISO), University of Vienna, Vienna, Austria

Abstract

Three major features characterize slavery in Renaissance Europe: First, slaves were not a distinctive social stratum or class within European societies but formed part of a larger group of bonded people. Although slaves' status, unlike others, was at least formally marked by their market price and the fact that they could be (re)sold at any point to anyone else, their services and effective social agency were often comparable to the situation of serfs, household servants, or other bonded workers in town or countryside. Slaves clearly belonged to the most vulnerable groups of society, but their individual situations could vary widely, and they were not always in the most powerless position.

Secondly, scholarly discourses on slavery existed side by side with different “practices of slaving” in Renaissance Europe. Although almost everybody agreed that Christians were not allowed to enslave or sell fellow Christians and that the enslavement of foreign people had to follow certain rules of warfare and international law, slaving practices could sometimes significantly differ from those norms without great need for dissimulation or justification. Slaving practices were an unquestioned element of Renaissance Europe even though they were not always termed or perceived as such.

Thirdly, slaving practices in the Renaissance had their focus – even though not exclusively – in the Mediterranean and were characterized by reciprocity between Christian and Muslim actors, in terms of quantity and quality (Bono, Corsari nel Mediterraneo. Cristiani e musulmani fra Guerra, schiavitù e

commercio. Milano, 2001; Botte and Stella, *Couleurs de l'esclavage sur les deux rives de la Méditerranée. Moyen Âge–XXe siècle*. Paris, 2012; Guillén and Trabelsi, *Les esclavages en Méditerranée. Espaces et dynamiques économiques*. Madrid, 2012). The master narrative on Europe's path to modernity, however, still continues to disguise this part of the story of Renaissance Europe by contrasting the Muslim slave trade and corsair activities with a "humanistic," "enlightened" "West".

Heritage and Rupture with the Tradition

During the Latin Middle Ages, two scholarly discourses about slavery stood side by side. One was a legal discourse with a strong Aristotelian tradition; the other was a theological one starting with the early Fathers of the Church (Böckenförde 2002; Priesching 2012).

Aristotle had distinguished two types of slaves: Those who were slaves "by nature," considered virtuously and morally inferior to other people, and those who were slaves "by positive law," as a consequence of war, for instance. Since then, the question of whether some people were naturally inferior and could be dominated by others had been a much-debated, controversial one. And although most medieval legal scholars agreed that slavery was a consequence of community-building processes rather than a basic quality of mankind, the tension between natural (*ius naturale*) and civil law (*ius civile*) remained an unsolved issue throughout the premodern Western world. Given the jusnaturalistic claim for liberty and equality of all men on the one hand and the institution of slavery and the practice of enslavement as a matter of fact on the other, which law

was more powerful: natural or civil law? And if slavery was against nature, was it to be regarded as illegal in absolute or merely relative terms?

The New Testament and the theological debate of the early Church Fathers provided an additional source for discussions of slavery; they increasingly interacted and blended with the legal discourse of the time. Although the Bible presupposes the existence of slaves and does not call into question the institution of slavery as such, the New Testament introduces a new metaphoric use of slave semantics. Besides the designation of a certain social group within society, all men are considered slaves of the devil and of their predisposition as sinners. Enslaved by sin, one can truly be freed only by baptism and believing in Christ. Freed from the slavery of sin, Christians then become God's servants, following the example of Christ who is seen as the first and best example of a servant of God. Christian ethics therefore includes an inversion of social valence: God's son came as a poor man, and the poor will one day sit next to Christ. "Serving" and "being a slave" were reevaluated by the New Testament and received a new, spiritual sense. This reevaluation, however, did not push the early Church to change the social order inherited from antiquity. Indeed, St Paul never questioned the institution of slavery, although, in his epistle to Philemon, he encouraged setting slaves free or treating them as brothers. Slaves and slavery, and later on estate-based society, were seen as a consequence of the fall of man and thus as a temporal, but necessary, phenomenon of earthly existence (Töpfer 1999; Burnside 2011).

To what extent both discourses, the legal and the theological, were intertwined may best be illustrated by Thomas Aquinas' *Summa Theologica* which, in a way, set the basis for Renaissance philosophy later on (Aquinas 1980). Here, a theological concept of law and political order was combined with an Aristotelian argumentation of reason and rationality. For Aquinas (c. 1225–1274), the law of nations stands between the natural and the civil law and functions as a mediator between the two. In his conception, slavery (as much as property) is not set by nature but by

human reason and is thereby considered useful for human life (*ad utilitatem humanae vitae*). Whereas one of the first principles (*prima principia*) of natural law is that all men are free by nature, slavery as an institution of the rationally oriented law of nations functions as a useful addition (*additio*) to natural law. In addition to the *primum principium* that all men are equal and free, slavery can be seen as an element of a secondary set of rules (*secunda praecepta*) and is thus judged legal and legitimate as long as the rules of the law of nations are respected (II-II, qu. 57).

Aquinas' discussion of whether and under which circumstances waging war is permitted (II-II, qu. 40) set the ground for a debate on just and unjust wars and the conditions of legal enslavement of prisoners of war (Franke 2009); the debate lasted for centuries and only took a new shape with the natural rights philosophers like Francisco Suárez (1548–1617), Hugo Grotius (1583–1645), Thomas Hobbes (1588–1679), Samuel of Pufendorf (1632–1694), and John Locke (1632–1704) and the Age of Enlightenment (Suárez 1856; Grotius 1720; Hobbes 1970, 1983; Pufendorf 1740, 1759; Locke 1965, 1970). It was the seventeenth-century debate on natural rights that “secularized” the scholastic argument for slavery as a consequence of the fall of man by replacing the theological argument with the one of human reason. The abolitionist idea, however, was still far from being born (Franke 2009).

Innovative and Original Aspects

Besides the two scholarly discourses of slavery, the legal and the theological one – and maybe as a consequence of their permanent interaction – it had become commonplace within western Europe that slavery was an unquestioned side effect of war, piracy, poverty, personal misfortune, or punishment, but that the enslavement of Christians by Christians was not allowed on European soil. By the turn of the millennium, the policies of worldly and ecclesiastical rulers and the new socio-economic conditions of estate-based society had indeed made slaves a rather marginal phenomenon within Western Europe (Fynn-Paul 2009).

During the time of the Renaissance, however, things changed fundamentally. Although the discourses of slavery remained more or less the same, slavery within Europe became a social and economic factor of some importance again. Slaves appear among other sorts of servants in urban households of patrician and bourgeois citizens; they work side by side with serfs and other bonded people on the fields of secular and ecclesiastical landowners or are involved in the workshop's production of craftsmen or the business activities of merchants (Haverkamp 2005; Cottias et al. 2006; Blumenthal 2009).

Most of these new Renaissance slaves initially came from the Black Sea Region and were increasingly replaced by people from south of the Sahara only after the fall of Constantinople in 1453 and the Portuguese discovery of the sea route to West Africa around 1460 (Earle and Lowe 2005). Here, the principle that Christians did not enslave Christians was obviously not applied to members of other Churches. People of Greek or Russian orthodox confession or members of the Bosnian Church regularly appear among the trading books, sales contracts, testaments, and inventory lists of western merchants and household masters (Verlinden 1955/77; Balard 1978; Karpov 1986).

From the sixteenth century onward, the face of European slavery changed again. This time, long-distance slave trade was complemented and gradually surpassed by economically motivated wars of corsairs and increasing piracy activity mainly in the Mediterranean Sea. Besides household slavery (the predominant form in late medieval times), court slavery, ransom slavery, and galley slavery became characteristic elements of early modern societies (Davis 2003; Weiss 2011; Jaspert and Kolditz 2013).

At court, young slaves from sub-Saharan Africa or the Ottoman Empire, most of them children, were used as an exotic kind of status symbol (McGrath and Massing 2012). Their publicly staged education and conversion to Christianity became an “important ritual enactment of ownership” and a “practice of subject-making” (Rothman 2012: 32) in the early modern state-formation process. The prisoners of war and captives of corsairs

or pirates, for their part, were a relevant source of income for rulers as much as for private individuals. Once these people were captured, their exchange value was calculated according to their social status and family background and the financial resources they could mobilize for their ransom at home (Kaiser 2008; Ressel 2012). However, those who were not suitable for representative use as status symbol at court and did not have social and economic resources to be ransomed mostly ended up as galley slaves and often did not live long as oarsmen at sea.

Impact and Legacy

During the Renaissance, the ground was set for two major developments: the introduction of cattle slavery in the New World (Justenhoven and Stüben 2006; Priesching 2012) and the invention of race as a basis for theories of racism (Whitford 2009).

When the Europeans expanded into the Americas, the debate on the “Indios” and the European war in the New World led by late scholastics like Francisco de Vitoria (1483–1546), Bartolomé de Las Casas (1484/1485–1566), and Domingo de Soto (1494–1560) in Spain, the so-called *School of Salamanca*, built on medieval traditions (de Vitoria 1967; de Las Casas 1974; de Soto 1968). They renewed the Aristotelian argument of “slaves by nature” and justified the war against the “Indios” as a just war in the sense of Aquinas (Justenhoven and Stüben 2006; Priesching 2012).

When people from Africa were then brought in great numbers to the Americas and other places to form the new class of slaves in the colonial overseas societies, European rulers and scholars could lean on a reinterpretation of the Old Testament’s Curse of Ham (Gen. 9:25–26) that had been “a text of opportunity” for multiple interpretations from the fifteenth century onward. Whereas Noah’s son Ham represented the unfree serf in the feudal society of the Middle Ages, Anniius of Viterbo (c. 1432–1502), in his *Commentaria* (Anniius of Viterbo 1498), identified Africa as a place of banishment for guilt and sin. And it was during the Age

of Reformation, through the writings of intellectuals like the historian and explorer George Best (1555–1584) and later on of the physician and anthropologist Charles White (1728–1813), that Africans became the “sexually perverted other” (Best 1578; White 1799). By the eighteenth century, their black skin was clearly interpreted as the visible expression of Ham’s sin; the enslavement of Africans was now seen as a consequence of divine punishment (Whitford 2009).

Although slavery in the Americas developed its own, new face and even though its practice in terms of size and efficiency was pushed to a hitherto unseen level of “perfection,” it would not have been thinkable without its legal and practical traditions in Renaissance and Reformation Europe.

Smiglecus, Martinus

Born: 1563, Lwów, Poland

Died: 1618, Kalisz, Poland

Roman S. J. Darowski

Faculty of Philosophy, Akademia Ignatianum, Kraków, Poland

Abstract

Martin Smiglecus was an eminent Polish logician and philosopher. In Poland and Lithuania, Smiglecus' prolific creativity attracted

Roman S. J. Darowski: deceased.

interest, above all thanks to his economic and ethical treatise *O lichwie* (On Usury, Vilnius and Kraków 1596), which came out in several editions. Starting with the 5th edition of 1607, Smiglecius sought in that text to defend the peasantry from the excessive exploitation and drudgery. In defense of their personal freedom, he demanded that they should be permitted to purchase their own property and move freely to other places.

In Europe, he was known and appreciated for his two-volume work *Logica* (Ingolstadt 1618 and three editions in Oxford). This was particularly popular in England, where its benefits were enjoyed and appreciated right up to the mid-nineteenth century. In Oxford, there was even a “Smiglecius Society.” Smiglecius also published several theological and polemical books in Latin and Polish.

Alternate Names

[Śmiglecki, Marcin](#)

Biography

Martin Smiglecius was born November 11, 1563, in Lwów, now Lviv, Ukraine. In 1581, he entered the Jesuit order in Rome and studied philosophy (1582–1584) and theology (1584–1586) at the *Collegium Romanum*, where Suárez and Bellarmino were his professors. In the years 1586–1590, he lectured in philosophy at the Vilnius Academy. His lectures on logic were written down by a student and have been published as *Commentaria in Aristotelis Organum*. In 1586/1587, Smiglecius was a member of the Polish committee, which gave its opinion on the draft of *Ratio Studiorum*. In the years 1590–1600, he taught theology at the Vilnius Academy. In 1591, he became Master of Arts and Philosophy and in 1594 obtained a doctorate in theology. At the end of the sixteenth century, he served as Chancellor of the Vilnius Academy. In the years 1600–1602, he was Rector of the Jesuit College in Pułtusk and

from September 13, 1602, Rector of the College in Poznań. In 1608 he participated in the sixth General Congregation of the Jesuits in Rome. In 1608 he was again Rector in Kalisz. From March 1609 on, he was the Superior at the Domus Professa in Kraków. In 1611 he returned to Kalisz, where he was Prefect of Studies of Philosophy and Theology. In 1615/1616 he participated in the seventh General Congregation of the Jesuits in Rome, where, after the death of General Claudio Aquaviva, Muzio Vitelleschi was elected as the new General. Smiglecius died July 26, 1618, in Kalisz, Poland.

Heritage

His monumental work entitled *Logica* (over 1600 pages in length) is a collection of 18 treatises (*disputationes*) on logic, explored against the broad background of epistemology and metaphysics. The philosophy of Smiglecius belongs to the Christian Aristotelianism, influenced by some Renaissance tendencies. It displays considerable originality, pursuing as it does an intermediate path between Thomism and Suarezianism. Smiglecius is considered the “initiator of a tendency in metaphysics whose continuation was, in some sense, the metaphysics of Leibniz and Wolff” (Domański 1989, 357). Ashworth and Lenz consider it probable that Smiglecius’ thought exercised an influence on Locke’s theory of language.

In Smiglecius, we encounter the initial beginnings of some areas within both more modern and contemporary formal logic. Among the issues covered are ones that can be deemed to belong to term logic, the logic of classes, propositional-sentential logic, the theory of logical entailment, and modal logic and semiotics.

Smith, Thomas

Born: 1513

Died: 1577

Kate Aughterson

University of Brighton, Brighton, UK

Abstract

Smith’s political philosophy of a mixed monarchical government, in which Parliament and citizens had an active ruling function, expressed most famously in his *De Republica Anglorum* (published after his death in 1583) emerged both from his intellectual involvement in the crucible of late Henrician Reformation political and theological debate and his practical experience of political office during the reigns of both Edward VI and Elizabeth I. In that work, as well as through the privately circulated *A Discourse of the Commonweal of England*, Smith first articulates what later becomes a commonplace account of English political stability: that the political structures of the English state echo and represent the social structure, in which there is a balance between Commons, Lords, and monarch, between center and regions, all subject to the law. His political embassy in France enabled him to contrast the developing English model of “mixed government” with the more oligarchic French practice. Nevertheless, this open political model continued to exclude men who did not own land, and all women: his inclusive social and political model uses the patriarchal family as exemplum.

Biography

Sir Thomas Smith’s successful early academic career (as Vice Chancellor of Cambridge University and then Provost of Eton College in the 1540s) turned to political service after the death of Henry VIII, as Clerk of the Privy Council to Lord Protector Somerset in 1547, then Secretary of State in 1548, helping to draft the Act of

Śmiglecki, Marcin

► [Smiglecius, Martinus](#)

Uniformity and the first *Book of Common Prayer*, and usher these successfully through Parliament in 1549. He wrote his first political treatise (*A Discourse of the Commonweal of England*) in the early 1550s, a plan for currency reform in response to high inflation and social unrest. On Elizabeth I's succession in 1558 he sat on the commission to re-establish the Protestant settlement. In 1561 he wrote *A Dialogue on the Queen's Marriage* (widely circulated in manuscript), in which he advocated the political necessity of marriage for a woman ruler. As ambassador to France from 1562-6, he was deeply engaged in political negotiations with both the Catholic and Huguenot parties and wrote *De Republica Anglorum* (Dewar 1964, p. 112). He became a Privy Councillor in 1571, then Secretary of State in July 1572. Elizabeth I granted him land in County Down, Ireland, to establish an English settlement, based on his detailed blue-print (circulated in manuscript) and a political manifesto, published in 1571 (*A Letter...*): his son was killed in the battles to establish the settlement, and he surrendered his colonial interests to the Earl of Essex. As Secretary of State he found Elizabeth I's political 'irresolution and long-waiting' (Letter, BL, Lansdowne MS 19/81, fo.178) frustrating: the academic political philosopher was always more influential than the practical politician.

Heritage and Rupture with Tradition

His political treatises (*De Republica Anglorum* and *A Discourse of the Commonweal of England*) display an erudite understanding of political and economic philosophy and theory, freely referencing Plato and Aristotle, Roman and more recent European history, to formulate an understanding and account of the English "Commonwealth." Smith was the first Englishman to articulate as political philosophy the shift of political authority to a new secular nation-state in the light of the post-Reformation break from the pope. This was particularly acute in Tudor England, where political authority inhered successively in an under-age young man, and then two female rulers. Smith's model of "mixed government" (*De Republica Anglorum*, chapter 6) in which

Parliament, Crown, and Lords shared political authority subject to the law thus emerged out of this historical necessity: the implicit lack of adult male authority required the balance of a strong parliament, Lords, and the law. This idea of balanced and mixed government influenced seventeenth-century Parliamentarians, and later Whigs, an English defense against European and Stuart political absolutism. Smith defines the members of the Commonwealth as all "subjects and citizens" but excludes bondsmen ("the fourth sort of men, which do not rule," chapter 24) and women (Chapter 16) from ruling and making laws. He describes a fluid social structure in which yeomen can become gentlemen through wealth, education, and professional work (Chapter 21).

Smith's comparative political philosophy was written in a populist style: "I have [written]. . . in the language of our country, in a style midway between the historical and the philosophical, giving it the shape in which I imagined that Aristotle wrote of the many Greek Commonwealth books which are no longer extant" (Letter to Burleigh, cited in Dewar 1964, pp. 111-2), and is explicitly pragmatic: "not in that sort as Plato makes his common wealth or Zenophon his kingdom of Persia, nor as Syr Thomas More his Utopia feigned common wealths such as never was nor shall be, vaine imaginations, phantasies of Philosophers to occupie the time and to exercise their wittes: but so as Englande standeth and is governed at this day the xxviii of March Anno 1565" (Book III, chapter 9, p. 144). Smith's writings and political actions in the Irish colonial settlement were influential on Raleigh, Bacon, and John Smith's ideas on colonial practices over the subsequent decades.

Innovative and Original Aspects

Smith's articulation of the symbiotic relationships between Crown, Commons, and Lords models a balanced government and social mobility as key to political stability. His emphasis on the rule of law influenced English legal and political theory as it emerged in Elizabethan and Stuart Parliaments (for example, Edward Coke). Smith's

Letter to Sir Francis Walsingham in the wake of the St Bartholomew's Day Massacre in 1572 illustrates his view that the rule of law is paramount, arguing that the supposed malefactors should have been "apprehended, imprisoned, interrogated and judged" rather than massacred (B.M. Harl.Ms.260/188).

Impact and Legacy

Smith's model of political inclusiveness was used by Republican Parliamentarians in the seventeenth century (e.g., in the Putney Debates) as a ground for social and political radicalism; but equally his defense of the power of monarch and Parliament were used by moderate Royalists to defend the status quo. His work's influenced Thomas Hobbes, Robert Filmer and John Locke, and the continued debate about the power balance between monarch and parliament.

Soares, Cipriano

Born: 1524, Ocaña, Spain

Died: 1593, Plasencia, Spain

Catarina Fouto

Department of Spanish, Portuguese and Latin American Studies, King's College London, London, UK

Abstract

Soares was the author of one of the top best-selling rhetoric manuals from the Renaissance. His *De arte rhetorica libri tres* (Coimbra, 1562), containing a summary survey of the discipline, decisively influenced the teaching and learning of rhetoric in southern Europe. The *De arte rhetorica* was later adopted as a rhetoric manual in the *Ratio studiorum* of 1599.

Alternate Names

[Suárez, Cipriano](#); [Soarez, Cypriano](#); [Soarius, Cyprianus](#)

Biography

Cipriano Soares (Ocaña, Spain, 1524–Plasencia, Spain, 1593) was born into a New-Christian family but entered the Society of Jesus in Portugal in 1549. Having studied and taught rhetoric and the *studia humanitatis*, he was made a master in arts in 1560. Soares taught Latin, Greek (and even rudiments of Arabic), and rhetoric at the College of St Anthony in Lisbon (1553–1555), where he was appointed prefect, and the Colégio Real in Coimbra (1555–1560). Years later became a master in theology and dedicated the rest of his life to the study and teaching of the Holy Scriptures and natural philosophy. He later served as the director of the Jesuit Colleges of Évora and Braga (1570) in Portugal up until his retirement in 1580, when he definitively returned to Spain (Moss and Wallace 2003, pp. 115–117). Thus, both the composition of the *De arte rhetorica* and its tremendous publication success are linked to the Jesuit educational system.

Heritage and Rupture with the Tradition

The book's appeal resides in the clarity of the exposition, the identification of the sources of the book in the margins (mainly Cicero, Quintilian, Aristotle, and *Rhetorica ad Herennium*), and the use of examples from Cicero's speeches to illustrate the exposition of theory (Mack 2011, p. 178; Albuquerque Garcia 1992: *passim*; Flynn 1957). There is equal evidence in the structure and treatment of topics that Soares's book is indebted to the work of Northern European rhetoricians like Agricola, Erasmus, and Melanchthon, who had been read more extensively by Portuguese and Spanish intellectuals than Italian rhetoricians (Mack 2011, p. 176; Pereira 2012, pp. 576–582; 707–749). The *De arte rhetorica libri tres* is, therefore, an important work of humanistic synthesis.

Soares's manual denotes his extensive knowledge of the corpus of classical rhetoric, and his work's structure illustrates this. Moss and Wallace (2003, pp. 130–186) offer a useful translation of Ludovico Carbone's complete *Tabulae* or guide to

Soares's book (itself printed countless times up until the eighteenth century). The following overview of the *De arte rhetorica libri tres* owes much to the work of Mack (2011) and Pereira (2012, pp. 795–809). Book I is dedicated to the definition of rhetoric, a discussion of the three types of rhetoric and an explanation of rhetoric as *ars* (informed by *De inuentione* and Aristotle), the importance of *inventio* (influenced by northern European rhetoricians), and a detailed exposition of the topics of invention based on Aristotle's *Topica*; book II opens with a discussion of the significance of *dispositio* with a particularly detailed exposition of the *exordium* (indebted to Aristotle), followed by a section on argumentation (which suggests that Soares saw a close link between rhetoric and dialectic, again showing the influence of North-European authors); book III focuses mainly on the theory of style, with much briefer sections on memory and *actio*. In book III, the chapters dedicated to tropes are indebted to Quintilian and the *Rhetorica ad Herennium*, while Soares bases his sections on prose rhythm on Cicero's *Orator*.

Though Soares praises the Church Fathers in his *De arte rhetorica*, he never uses them as examples and quotes instead often from Cicero (chiefly, but also), Horace, Livy, Vergil, Sallust, and Ovid. His detailed discussion on style denotes a preference for Ciceronian oratory at the expense of the low style of Christian eloquence endorsed at the Council of Trent (1545–1563). In the *De arte rhetorica*, Soares illustrates to what extent the Jesuit educational system was more permeable to Ciceronianism (Pereira 2012, pp. 806–809) in contrast to the Senecanism promoted, among others, by Justus Lipsius, and akin to the style of rhetoric advocated by Carlo Borromeo and his followers (Fumaroli 1980, pp. 135–152; Mouchel 1990).

Impact and Legacy

Mack (2011, p. 179) identifies 78 editions of the book between 1562 and 1620 and a further 51 abbreviated editions up to 1700, proving the popularity of Soares's book. Its second edition

(Venice, 1565), revised by the Jesuit Peter Perpinian who had worked side by side with Soares in Portugal, underwent some alterations, notably the inclusion of a section discussing rhetoric as imitation (1565, I.11). Soares's *De arte rhetorica* was later adopted as a manual of the Jesuit *Ratio studiorum* in 1599 and continued to be read until the eighteenth century.

Socinianism

Mariangela Priarolo

Department of Philosophy and Cultural Heritage,
Ca' Foscari University of Venice, Venice, Italy

Abstract

Socinianism is a term that could have at least two meanings. The first refers to the religious Unitarian movement broadened at the end of the sixteenth century by the early followers of the Italian thinker Fausto Sozzini (Faustus Socinus or Socini), which crossed and

overlapped with the *Ecclesia minor* (Minor Church) of Poland – the Antitrinitarian branch of the reformed Church of the *Fratres Poloni* (Polish Brethren). The second sense stands for the Christian theological, philosophical, and moral doctrine inspired by the works of Fausto and his uncle Lelio (Laelius), which became widespread in Europe, especially in Holland and England, from the seventeenth century and later in America.

Heritage and Rupture with the Tradition

Socinianism is rooted in the intense movement of people and ideas that distinguished the rise and strengthening of the Reformation in Europe. Its main connections can be found in sixteenth-century Antitrinitarianism, which has been considered one of the peculiar features of the Radical Reformation (Biagioni 2016), in the demand for religious renewal praised by Spiritualists and Anabaptists (Roth et al. 2007), and in the humanist ideal of critical thinking. In addition to Miguel Servet, Lelio, and Fausto contested the Trinity by reading the Scripture through the philological method of Lorenzo Valla (Cantimori 1939). In their criticism, however, a very important role was also played by Aristotelianism, which Lelio encountered during his stay in Padua (Rotondò's introduction to Sozzini 1986) and Fausto used eventually against the Platonism that, according to him, characterized Christian doctrine (Scribano 2007, Salatowsky 2015). Servet's death in Geneva in 1553 at stake because of his denial of the Trinity, obliged Antitrinitarians either to hide, with a nicodemite attitude very familiar to Italian dissenters (Cantimori 1939; Rotondò 1967), or to find a safe place where they were not prosecuted. As a consequence, many Italian thinkers fled to Poland, where the Confederation of Warsaw of 1573 had declared a policy of tolerance between Lutherans, Calvinists, and the Bohemian Brethren, who had been present in Poland since the 1550s. Formally excluded from the covenant, Antitrinitarians could also take advantage thereof (Wilbur 1947; Caccamo 1970; Balázs 2015). Hence, this climate of tolerance, which also

distinguished the later reigns of the Catholic Stephen Báthory (1576–1586) and his successor Sigismund III Vasa (1587–1632), allowed the growth of Socinianism consequent on Fausto Sozzini's influence on the Minor Church of Raków (Wilbur 1947; Kot 1957). Since his arrival in Poland in 1579, Sozzini became the reference point for the Polish Antitrinitarians, to whose reunification he contributed during the 1580s through an internal and measured discussion of several theological or practical issues, as, for instance, the commitment of Christians in politics (Szczucki 2004). However, starting from the 1630s, the increase in Poland of the Catholic Counter-Reformation due to Władysław IV and John II Casimir and the internal political divisions caused by the 30 Years War, led to the persecution of Socinians – in 1638 its center in Raków had even been destroyed –, who were definitively expelled from the country in 1658 (Tazbur 1974; Williams 1980).

Innovative and Original Aspects

The humanity of Christ and the unity of God are two among the several distinctive aspects of Socinianism. Both of these points descend from a critical analysis of the Scripture, in particular of John's Gospel. Through a historical and anti-metaphysical reading of its prologue, Lelio and then more extensively Fausto claimed that Christ was a man, who had been chosen and divinized by God in order to show the way to attain the eternal life, which is God's reward for good Christian conduct (*Brevis explicatio in primum Iohannis caput*, Sozzini 1986, 101–128; *Explicatio primae partis primi capituli Evangelistae Iohannis*, Sozzini 2004, I, 73–85). For this reason, and contrarily to some non-adorantist or Judaizing tendencies among Polish and Transylvanian Antitrinitarians (Szczucki 1982), Fausto Sozzini underlined that Christ must be worshipped, although he was wholly human and his death did not represent atonement for human sins but only an example to follow (*De Jesu Christo Servatore*, Sozzini 2004, II, 119–246).

Sozzini's reading of John's Gospel derived from the thesis according to which Christians should analyze the Scripture through reason, by explaining the problematic points with a comparative analysis of the Bible itself, as religious truths can be above reason, but never against it (*De Sacra Scripturae Auctoritate*, Sozzini 2004, I, 263–284; Cantimori 1939). Among these religious and rational truths, it is worth recalling, on the one hand, the refusal of the doctrine of original sin and the consequently great extent of human freedom (cf. Biagioni's introduction to Sozzini and Pucci 2010), and, on the other hand, the limits of the power and knowledge of God. Nonetheless, according to Fausto, even if human reason can grasp all the essential doctrines of the Christian religion, it cannot state by itself the religious truths, which only Scripture can reveal (Rohls 2005a). This form of rationalism, though very limited, as well as the distinction between *fundamentalia fidei* and *adiaphora* already present in Erasmus, whose thought was well known to Fausto (Bietenholz 2005), led Socinianism, from the time of Lelio's discussion with John Calvin, to the antidogmatic view that in order to be saved only a few doctrines needed to be accepted, since what really matters is behaving in accordance with the ethical principles preached by Jesus Christ (Ogonowski 1974). Despite Fausto's thinking that true religion lies in the Bible and that non-believers cannot be saved, since Christian doctrine provides the only true path to salvation, Socinianism became over time one of the most important supporters of toleration, whose limits and extension would be clarified by the 1665 Amsterdam edition of the Catechism of Raków, first published in 1605, one year after Fausto's death (Pintacuda de Michelis 1975).

Impact and Legacy

After the 1656 diaspora, some Socinians fled to neighboring countries, such as Brandenburg, East Prussia, and Silesia, where, however, they were not always well-received (Tazbur 1974). Consequently, they mostly emigrated to the

Netherlands, where their doctrines had been known since the end of the sixteenth century (Kühler 1912). In 1598, for instance, the Socinians Christophorus Osterodt, a German theologian, and Andreas Voidovius, a Polish nobleman, travelled to Amsterdam in order to obtain support from the Dutch political authorities (Simonutti 2005a; Rohls 2005b). Their mission failed, and the Antitrinitarian books which they carried with them, among which was Fausto Sozzini's treatise *De Jesu Christo Servatore*, were seized, but Socinian thought started to be analyzed and discussed by noteworthy thinkers, such as Hugo Grotius (Blom 2005). Ironically, during the intense conflict between Gomarists and Arminians that took place at the beginning of the seventeenth century, many exponents of Arminianism, who had criticized Sozzini's doctrine, as Hugo Grotius had done (Blom 2005; Rohls 2005a), were charged with Socinianism. This overlapping depended on the similarity that existed between Arminian and Socinian conceptions about predestination and human freedom (Visser 2004). Contrary to Gomarism or in general Calvinism, both confessions valued the role of human behavior for salvation, as well as the use of reason in religious matters (Rohls 2005b). As Pierre Bayle among others observed (Bayle 1740, art. "Socin, Fauste"), religious rationalism, as well as the already mentioned doctrine of tolerance, could be seen as the most important legacy of Sozzini's thought, despite the limits imposed by him on reason. This is particularly evident in the writings of Sozzini's nephew, Andrzej Wiszowaty, whose *Religio rationalis*, published posthumously in 1685 (Wiszowaty 1982), has been considered for a long time as the prelude to eighteenth-century Deism (Israel 2006). As has been shown, in seventeenth-century European philosophy Socinianism played an essential role in the debate and was recognized by the most important philosophers of the time – for example, Hobbes (Paganini 2005), Spinoza (Mignini 2005), Locke (Simonutti 2005b; Marshall 2000) and Newton (Snobelen 2005) – as a theoretical and theological system with which one must come to terms. Even after having been defeated by mainstream thinkers, Socinianism did not vanish.

Rather, it became an ideal paradigm of rationalism, tolerance, and freedom, especially in eighteenth-century North America (Wilbur 1952).

Abstract

Paolo Barbò da Soncino was an Italian Roman Catholic priest, friar of the Order of Preachers (Dominicans), Thomist philosopher, and Doctor of Theology (Kaeppli T., Panella E. 1970–1993). His life and work fall within the ambit of Italian Renaissance Thomism of the fifteenth century. Among his masters were probably Peter Maldura of Bergamo (d. 1482) and Dominic of Flanders (d. 1479). His principal work, the exposition of Aristotle's *Metaphysics*, proceeds from a particular synthesis of the Arabic commentator Averroes, Thomas Aquinas, Hervaeus Natalis (d. 1323), and John Capreolus (d. 1444). Soncinas' work and position were frequently discussed from the sixteenth to the seventeenth century.

Biography

Soncinas was born around 1458 in the small Italian town of Soncino, near Cremona in Lombardy (Jindráček 2008, pp. 80–87). As a young man in 1472, he entered the Dominican Priory of St. James in Soncino which belonged to the Observant Congregation of Lombardy. After initial formation, he was from 1474 a student at the Dominican studium in Bologna and from 1481 a formal student at the Dominican studium generale, integrated into the University of Bologna. Among his schoolfellows in this period were Silvestro Mazzolini da Prierio (d. 1527) and Girolamo Savonarola (d. 1498), who succeeded him in 1487 as the Master of Students (Jindráček 2008, p. 97). During this time, Soncinas probably wrote his first philosophical work *Elegantissima expositio in artem veterem Aristotelis* (printed in 1499), a scholastic exposition of Porphyry's *Isagoge* and Aristotle's *Categories* (*Ars vetera*). After 1485, he was teaching and preaching in Milan and Landriano in Lombardy (in two convents of the same name *Santa Maria delle Grazie*), and at the same time, he was preparing an edition of Aquinas' *Opuscula* and Vincent Ferrer's *Sermones*, printed in 1488. In this period we can also place his edition of Peter of Palude's commentary on the fourth book of Peter Lombard's *Sentences*, printed in Venice in 1493. In 1493, Soncinas returned to St. Dominic's priory in Bologna, where he taught theology in terms of Peter Lombard's *Sentences* as a formal bachelor, and on 30 May 1495, he graduated from the University of Bologna as a Doctor (Magister) of Sacred Theology. To this period also, we can date two or three of his works: the edition of Aquinas' commentary on the *Second Book of Sentences* in collaboration with a Benedictine monk Marco da Benevento (d. ca. 1524), printed in Bologna in 1494, and the completion of the most important and most widely read of Soncinas' works, the *Acutissimae Quaestiones Metaphysicales*, first printed posthumously in Venice in 1498. The compendium, which Soncinas called *Divinum epitoma quaestionum in quatuor libros Sententiarum*, an extract of John Capreolus' *Defensiones*, likewise first printed posthumously

in Pavia from 1521 to 1522, is difficult to date but also probably comes from this last stay in Bologna together with his correspondence with the noted Renaissance thinker Gianfrancesco Pico della Mirandola (d. 1533), the nephew of the more famous Giovanni Pico della Mirandola (Picus 1573, II, pp. 1284–1285, 1313–1314). After his doctoral promotion, Soncinas was appointed as prior of St. Dominic's priory in Cremona where he died soon after on 5 August 1495 (Jindráček 2008, pp. 108–109).

Heritage and Rupture with the Tradition

Soncinas is one of the classic examples of a Thomist of the fifteenth century living in the ambience of the Italian Renaissance and following the observant religious reform whose intellectual formation was profoundly rooted in the scholastic method and Aristotelian-Thomist tradition. In addition to the works of the Stagirite and Aquinas, he had a very good knowledge of Averroes' commentary and other classical and scholastic authors like Cicero, Boethius, John Duns Scotus, Hervaeus Natalis, Gregory of Rimini, Antonio Andrea, Giles of Rome, Francis of Mayrone, et al. Among the Latin translations of Aristotle's *Metaphysics*, he evidently preferred William of Moerbeke's (d. ca. 1286) version but also took into account that of Michael Scotus' (d. ca. 1235). Soncinas distinguished very precisely between theological and philosophical knowledge or method, and in philosophy he used only rational arguments. In general he was convinced that the best interpretation of Aristotle was to be found in Averroes' commentary and that Aquinas' interpretation was largely reconcilable with it.

Soncinas' works can be divided into three groups: In the first, there are editions of other authors like Vincent Ferrer's *Sermones* (1488) and Aquinas' *Opuscula* (1488). Soncinas' edition of the *Opuscula* is appreciated as one of the better versions, compared to earlier printed editions (*Summa opusculorum* 1485/1488), as is noted in the introduction to the critical Leonine edition (Thomas de Aquino 1976, pp. 117–118, 176, 222, 273–274). The edition presents

51 opuscula of which modern critics today consider only 16 to be inauthentic. Two other books, Peter of Palude's *In quantum Sententiarum* (1493) and Aquinas' *Scriptum super secundo libro Sententiarum* (1494), await critical evaluation.

With those editions is connected another interesting category of Soncinas' literary production, typical of the Renaissance culture: his scholarly or philosophical *epistolary*. There are introductions or dedications to editions such as the letter *Cum nuper Mediolanum venissem* of 29 February 1488 addressed to Ludovico of Calabria, the General Vicar of the Observant Congregation of Lombardy (1487–1489), published with Vincent's *Sermones*, the *Qui gratulatum* of 15 May 1488 for Cardinal Ascanio Maria Sforza (d. 1505) in Aquinas' *Opuscula*, and the *Constitueram magnis amniti viribus* of 1 July 1493 for Tommaso Donato (d. 1505), the Dominican Patriarch of Venice in Paludanus' *In quantum Sententiarum*.

Finally, here are three speculative works. The dating is not sure, but the first was probably the commentary on *Ars vetera* called variously as *Elegantissima expositio in artem veterem Aristotelis* (ed. Venice 1499) or *Lucida et subtilis expositio in Porphyrii Isagogen et Aristotelis Praedicamenta* (ed. Venice 1587) or *Expositio in Porphyrii Isagogen et Aristotelis Praedicamenta* (ed. Venice 1600). This is a classical scholastic commentary on Aristotelian "old" logic in two parts: an exposition of Porphyry's *Isagoge* in seven chapters and an exposition of Aristotelian *Categories*, subdivided into three parts *De antepredicamentis*, *De praedicamentis*, and *De postpredicamentis*. The work was very probably intended as a manual for students of philosophy (in Bologna?).

The second work is his *Divinum epitoma quaestionum in quattuor librum Sententiarum a principe thomistarum Ioanne Capreolo* (ed. Pavia 1521–1522; Lyon 1528, 1529, 1580; and Salamanca 1580). This book also most likely comes from his teaching activities and is mentioned in his correspondence with Pico (Picus 1573, II, 1313; cf. Paulus de Soncino 1521, I, a4v–a5r). The whole work is in fact an abbreviated extract from the monumental work *Defensiones theologiae divi Thomae Aquinatis* of John Capreolus (Bedouelle 1997, pp. 201–204).

Because it is an "epitome" – an extract from another author, as is the case with Silvestro da Prierio's *Opus in Capreolum* in 1498 – its relationship to Soncinas' own thinking is somewhat problematic. This difficulty applies especially to the doctrine of the eternal truths which Soncinas later does not defend but in the *Epitoma* probably only expresses the opinion of Capreolus (cf. Wells 1994a, pp. 19–29, 1994b, p. 199, 1997, pp. 264–268; Mahoney 2004, pp. 630–631; Jindráček 2012, pp. 165–166).

The most important of Soncinas' works is his commentary on Aristotle's *Metaphysics* [*Acutissimae quaestiones metaphysicales* = AQM [ed. Venice 1498, 1505, 1526, 1576, 1588 (photo reprint Frankfurt 1967), ed. Lyon 1579 by Petrus Landry and another by Carolus Pesnot, ed. Oberursel 1622] where his own mature views are presented, together with relevant arguments and polemics. The dating in this case is also uncertain, but from the correspondence with Pico, it is evident that at the beginning of 1495, the work was considered to be complete (Picus 1573, II, 1313). This is a scholastic commentary in the form of questions and includes 8 of 14 of Aristotle's metaphysical treatises: books IV–X and XII. Soncinas explains this selection in his preface mainly on the grounds of the repetitive nature of the omitted books. Among Soncinas' characteristic views, we should note here especially his understanding of the *common being* to include God and separated substances as parts and not only principles (cf. AQM, IV, q. 10). This is a synthesis of Averroes' and Aquinas' arguments directed against Dominic of Flanders. Even more interesting is his view on the concept of the unity of being. Together with the classic analogical unity and predication, Soncinas defended the concept of being as a disjunctive term ("*ens*" expresses immediately the substance or accident = *conceptus disjunctus*); this view is probably taken from Hervaeus (cf. AQM, IV, qq. 3 and 4). On the question of distinction between essence and existence, Soncinas defended the fairly widespread Thomistic position of a real distinction, which he himself considered as "the most fundamental part of Aquinas' doctrine," even using the terms *res ad rem* (AQM, IV, q. 12). But in this work, we can also find some other less traditional ideas such as the

identity of a relation with its fundamentum (AQM, V, q. 28) and the exclusive competence of physics in the demonstration of the existence of God (AQM, IV, q. 9). Some of these ideas even led Cardinal Cajetan (d. 1534) to write a now lost polemical treatise called *Super erroribus Soncinati* (Von Gunten 1969, pp. 341–344; Jindráček 2008, p. 137).

Impact and Legacy

Although Soncinas' work is today known primarily for its role in the controversies with Francisco Suárez (d. 1617), he had some direct disciples and admirers. Among these can be mentioned Andrea da Perugia (d. 1548); Gaspare di Baldassare da Perugia (d. 1531), the author of the *Apologia Pauli Soncinatis olim magistri sui*, a polemical answer to Cajetan, which is itself now lost (Tavuzzi, 1996, p. 601); and Isidorus de Isolani da Milano (d. ca. 1528), his first biographer (Paulus de Soncino 1521, I, A2r-A6r) and editor of the *Epitoma*. With reference to Soncinas, we should also note Chrysostomus Javelli (d. 1538) and several other scholastic philosophers of the sixteenth and seventeenth centuries (Jindráček 2008, pp. 134–142) like Francesco Silvestri da Ferrara (d. 1528) or Domingo Bañez (d. 1604) and even Gottfried Wilhelm Leibniz (d. 1716).

Sophists

Teodoro Katinis

Department of Literary Studies, Ghent University,
Ghent, Belgium

Abstract

The ancient sophists, such as Gorgias of Leontini and Protagoras of Abdera, are generally – and often superficially – connected to relativism, immoralism, skepticism, and opportunism. Their historical and intellectual identity was recovered during the Renaissance along with other classical authors, especially Plato who built his philosophy against the sophistic tradition of the fifth and fourth century BC. Starting with the fifteenth-century translations and commentaries, from Leonardo Bruni to Marsilio Ficino, the sophistic writings resurfaced and played an important role in the philosophical and literary history of the European Renaissance. Several Renaissance authors provided original reinterpretations of the ancient sophists both in Neo-Latin and vernacular literature. International scholarship has recently started a detailed exploration of the rebirth of sophistry in early-modern era and has already provided important results that this entry intends to summarize.

Heritage and Rupture with the Tradition

Because of Plato's condemnation of the sophists and the difficulty to recover their writings, the sophistic literature has been mostly transmitted as a fragmentary tradition in which secondary sources and different interpretations have played a major role. The recovery of the classical authors, especially Plato, in the fifteenth century represented an important turn. Indeed, for the first time, early-modern scholars were able to access an increased amount of primary and secondary sources that allowed them to deepen the study of the ancient sophists and their ideas, which led to either refuse or rehabilitate them. In these respects, ironically, the principal source for the recovery of the ancient sophists, especially Gorgias of Leontini and Protagoras of Abdera, was their worst adversary, i.e., Plato. The discussion between Socrates and the sophists is quite a consistent aspect of Plato's dialogues, and thanks to this fictional representation, Plato actually allows the reader to learn about sophists and their theories. When the fifteenth-century humanists translated and commented Plato's works in Latin, they gave the European readers the opportunity to access the sophistic tradition that Plato and Platonists wanted to destroy forever. Several sixteenth-century scholars interpreted and used this tradition in different original ways, so that the rebirth of sophistry affected both literature and philosophy of the Renaissance, both in Latin and the vernaculars and in different cultural contexts, especially Italy, France, and Spain.

Scholars have warned not to consider sophistry as a uniform movement, given that each sophist had in fact a specific intellectual profile and background, which explain the variety of works and thoughts within the literary production of the Antiquity. Since the nineteenth century, thanks to the collection of sophistic fragments published by Diels and Kranz (1951–1952) – to quote only the main scholarly enterprise – we are by now aware of the rich variety of the sophistic period, although we can still recognize some general common aspects in the authors of both the First and Second Sophistic (to use a classical and well-accepted periodization). But for the authors of the

Renaissance, that was no easy task, since some of their major sources for their knowledge of the sophists, i.e., Plato and Aristotle, tend to consider sophistry as a category (or the sophist as a kind, as it is clear in Plato's *Sophist*) rather than distinguishing the specificity of each sophistic figure.

As we mentioned above, the entire work of Plato intends to be a gigantic confutation of the sophistic tradition that needs to present the sophistic figures and their arguments in order to reach its goal. The first step in this recovery of the sophistic thought through Plato is Leonardo Bruni's Latin translation of the dialogue *Gorgias* in 1409 (Venier 2011), but the rebirth of the entire platonic corpus was possible only in 1484, when Marsilio Ficino's Latin translation and commentaries were published, to become soon a best-seller of its time. Aristotle's works, studied and translated with a new approach by humanists, played a role as well, in particular the texts where the sophists are discussed: the *Metaphysics*, *Rhetoric*, and *Sophistic Confutations*. Although Plato and Aristotle are the main references, the transmission of the identity and thought of the ancient sophists to the Renaissance passes through a large variety of sources. Two biographers were key figures as well: Diogenes Laertius, with his *Live of Philosophers* translated in Latin by Ambrogio Traversari in 1433 (Gigante 1988), and even more Philostratus, a sophist himself, with his *Lives of the Sophists*. Other works played a role in the transmission of sophistic thought and rhetoric: Aristophanes' comedy *The Clouds*, Euripides' tragedies, Thucydides' *History of the Peloponnesian War*, Xenophon's *Memorabilia*, Plutarch's *Moralia* (translated in Latin by Cardinal Bessarion around 1442), Sextus Empiricus' *Outlines of Pyrrhonism* and *Adversus mathematicos*, and the works of Cicero, Quintilian, Seneca, and Aulus Gellius. Indeed, all these authors benefited from the humanist interest in recovering the classics, at the same time disclosing the important information on the sophistic tradition kept in their works.

Original texts of sophists are rare and often fragments of lost works. Pietro Bembo had the opportunity to translate in Latin, in 1493, *Gorgias'*

Encomium of Helen (Bembo 1983), a masterpiece of the Ancient sophistic rhetoric. The Venetian publisher Aldo Manuzio contributed to the diffusion of the sophistic rhetoric with his 1513 edition of *Oratores Graeci*, in original, including among others *Gorgias' Encomium* and *Defense of Palamedes*. The recovery of the protagonists of the Second Sophistic (a definition invented by Philostratus) has also a part, in particular Lucian of Samosata, author of very influential paradoxical dialogues which were translated by Desiderius Erasmus (Marsh 1999) and had inspired not only his *Praise of Folly* but also Sperone Speroni's *Dialogo dell'Usura* and *Dialogo della Discordia* published in 1542 (Buranello 1999; Katinis 2015).

Marsilio Ficino's commentaries to Plato's dialogues, especially *The Sophist*, *Gorgias*, *Protagoras*, *Euthydemus*, and *Theaetetus*, take the side of Plato against the sophists, but at the same time make some of the sophistic perspectives very interesting to the reader and even seem to rehabilitate part of their thought. In fact, this is the case of Protagoras' "great speech" in Plato's *Protagoras* that Ficino interprets as an allegorical Pagan anticipation of the Christian truth (Katinis 2013, 2018, 20–33). Ficino's commentary on *The Sophist* (studied and translated by Allen 1989) is also important for the elaboration of a theory on the relation between imagination and demons, which goes beyond the matter of sophistry and Plato's intention, while the diffusion of this Platonic dialogue spread the notion of a distinction between "icastic arts" (purely imitative) and "phantastic arts" (crafting illusions), which had an important role in the sixteenth-century literary debate among, for instance, Gabriele Comanini (1591, 2001), Torquato Tasso and Jacopo Mazzoni (Giglioni 2010).

After Ficino, Erasmus was the major Latin author who not only translated and commented but also originally reworked the sophistic tradition for his own writings, for example, in his *Praise of Folly* in which Folly announces to her audience that she will play the sophist. The complex use of the sophistic tradition and thought in several of Erasmus' works has been studied by Eric MacPhail in the first monograph ever

written on the rebirth of the ancient sophists in the Renaissance (MacPhail 2006, 2011). Thanks to MacPhail's work, scholars also have a detailed analysis of the transmission of the sources of the sophistic tradition during early-modern time as well as its impact on the vernacular French literature, in particular in François Rabelais' *Gargantua* (1542), *Pantagruel* (1532 and 1542), and *Tiers Livres* and Michel de Montaigne's *Essais* (MacPhail 2012).

The Protagorean antilogic, i.e., the making of opposite discourses (*dissoi logoi*) on a subject (e.g., to praise and to blame the same thing) or speaking on both sides of an issue, affected Montaigne's works for the skeptical attitude that this antilogic practice implies. More generally, the practice of Protagorean antilogic, or the truth of opposites, is at the core of the sophistic Renaissance (MacPhail 2011, 74–103) and represents one of the most subversive aspects of the Greek pre-Socratic thought which challenges not only Eleatism and Platonism but also the ground of Aristotle's logic and ontology. Besides, the antilogic clearly witnesses the agonistic nature of the archaic Greek culture – including rhetoric and philosophy – which had a wide impact on the humanists and Renaissance scholars. Francesco Bausi (1992) saw the practice of antilogic in Leonardo Bruni's *Dialogi ad Petrum Histrum* and identified in Cicero's dialogues an important source for the transmission of this Protagorean technique. But Protagoras' legacy of the fifteenth century is not limited to Bruni and involves also Lorenzo Valla's *Dialectical Disputations* (Trinkaus 1976; Nauta 2009, 255–260).

Antilogic and relativism in ethics and politics are aspects of the sophistic thought that play a role in Montaigne's writings as well as in Niccolò Machiavelli's *Discorsi sopra la prima Deca di Tito Livio* (MacPhail 2011, 92–101). A further aspect of the sophistic eloquence that fascinated the Renaissance was the idea and practice of *kairos* as a principle of improvisation and adaptability, or – in other words – an ethic of timing in performing speeches. Sophists were technicians of *kairos*, and the performances of Gorgias in the theater of Athens were particularly popular. MacPhail (2011, 105–118) argues for the influence of this principle in Francesco Guicciardini's

Ricordi, Montaigne's *Essais*, and mostly in Erasmus' works.

Machiavelli and Guicciardini are not the only Italian authors involved in the sophistic Renaissance. The relevance of ancient sophists in understanding the vernacular literature of the Italian Renaissance is a growing line of research that has already had several contributions, although a complete exploration is still far from being achieved. Scholars have studied the role of rhetoric and rehabilitation of the ancient sophists in the works of Speroni Speroni degli Alvarotti (1989), a Paduan philosopher and rhetorician usually considered an Aristotelian (Pozzi 1989, Girardi 1990, Fournel 2014, 216–220; Katinis 2018, Chaps. II and III). In particular, Speroni's "trattatelli" *In difesa dei sofisti* and *Contra Socrate* (translated in Katinis 2018, Appendix) are a unique case of explicit defense of the ancient sophists since the condemnation in Plato's dialogues. The debate over sophistry in sixteenth-century Italy involves also other authors, often connected to Speroni and his *milieu*, such as Jacopo Mazzoni and Torquato Tasso, among the major figures of the time. Mazzoni's *Della difesa della Comedia di Dante* (1587, 1982, 1983) presents poetry as a sophistic art with a clear reference to the definition of "phantastic arts" in Plato's *The Sophist*, but reversing the Platonic condemnation, while Tasso engages sophistry in discussing the matter of poetry in his *Apologia in difesa della Gerusalemme liberata* (1875) and in his *Discorsi del poema eroico* (1964, 1973) attacks the revolutionary theory proposed in Mazzoni's *Della difesa* (Scarpati 1985; Scarpati and Bellini 1990; Russo 2000, 2002; Moreschini 2016; Katinis 2018, chap. IV). Even if sophistry is richly elaborated and reinterpreted mostly in the Italian sixteenth-century vernacular literature, there are at least two works to mention on the Neo-Latin side: Gerolamo Cardano's *Neronis encomium* (a praise of the emperor Nero) published in 1562 and *Antigorgias dialogus sive de recta vivendi ratione* (a dialogue against Gorgias and on the right way to live) published in 1566 (Gigliani 2012).

Important scholarly achievements have been reached also in Spanish literature, particularly on the reception of Protagoras of Abdera,

through Marsilio Ficino's translations and commentaries on Plato, in Miguel de Cervantes (Merkel 2004, 2011). Merkel argues that Cervantes knew about sophistry from either Ficino or other sources and that his three *Quijotes* engage sophistry even if not explicitly, so that Cervantes had an important part in the rebirth of the sophistic tradition, although rejecting the sophistic perspectives.

Since the nineteenth century, sophistry is not anymore considered a uniform movement, as it was for the authors of the Renaissance. Despite this mistake in their historical perspective, Renaissance authors understood very well that sophists were not only very skillful rhetoricians, who mastered the art of crafting and performing persuasive speeches, but also offered philosophical approaches which are alternatives to Platonism and Aristotelianism. Indeed, sophists' legacy influenced different spheres of the Renaissance intellectual life, including ethics, politics, and poetics, offering an anti-metaphysical perspective on life. Some of the fifteenth- and sixteenth-century scholars rejected this alternative; others were very attracted by it and explored its possibilities.

The early-modern fortune of the sophists goes beyond the Renaissance into the Baroque. One of the most important enterprises in these respects is the *Theatrum veterum rhetorum, oratorum, declamatorum* [...] by the Jesuit father Louis de Cressoles, published in Paris in 1620 (Fumaroli 2002, 299–311), while the works and discussions of seventeenth-century literature and criticism offer the material for further research in order to assess how long the sophistic Renaissance actually lasted. Further investigations and results on the debate over sophistry and its rebirth between the fifteenth and seventeenth century will be available in the forthcoming collection of essays that is now published in the journal *Philosophical Readings* 11.2 (2019).

Soto, Domingo de

Born: Segovia, 1494

Died: Salamanca, 15 November 1560

Victor M. Salas

Sacred Heart Major Seminary, Detroit, MI, USA

Abstract

Domingo de Soto, O.P., was a member of the Order of Preachers and, like many of his order brothers, was a devoted follower of Thomas Aquinas. Born in Segovia in 1494, Soto studied at various universities in Spain as well as in Paris before assuming a chair teaching philosophy at the University of Complutense. The Dominican was a major player in the Council of Trent which gave him the occasion to author his *De natura et gratia*, in which Soto attempted to address the errors of his Lutheran opponents. He also made contributions to logic, the philosophy of nature, and moral-political philosophy with his publications: *In dialecticam Aristotelis*, *Super octo libros Physicorum commentaria*, *Super octo libros Physicorum quaestiones*, and *De iustitia et iure*. Soto died in 1560 in Salamanca.

Biography

Domingo de Soto, O.P. (Segovia, 1494 – Salamanca, 15 November 1560), following in the tradition of other Dominicans (such as Francisco de Vitoria) in the School of Salamanca, was one of the principal proponents of Thomism in Spain's second scholasticism. Born in Segovia and baptized originally as "Francisco," Soto began his initial studies in Segovia but moved to Ochando, where he was a sacristan of the local parish (Solana 1940, 92). From 1513 to 1516, he continued his studies in the Faculty of Arts at the University of Alcalá (ibid., 92), which would later be the academic home to many important Spanish intellectuals of the golden age, most especially the Jesuits Gabriel Vásquez and Francisco Suárez. Eventually, Soto pursued his education outside of

Sørensen, Peder

► Severinus, Petrus

Spain entirely and graduated from the University of Paris with a baccalaureate in philosophy and a master of arts (ibid., 92).

After having taught in the arts faculty at Paris (D'Ors 1984, 209), Soto returned to Spain in 1519. In 1520 he accepted a position teaching philosophy at the College of San Ildefonso at Alcalá (Solana 1940, 92). Shortly thereafter he accepted a chair in philosophy at the University of Complutense where he lectured against the nominalism that he had learned in Paris (ibid.). While considering whether he would seek advancement to a chair in theology, Soto began to entertain the idea of a religious vocation (ibid.). Originally, he considered a vocation with the Benedictines but then in 1524 entered the Order of Preachers. He took the Dominican habit and the name "Domingo" at the Convent of St. Paul of Burgos where he made his religious profession on 23 July 1525 (ibid.). Soto continued his teaching career at the convent in Burgos, teaching logic, before being moved to the Convent of St. Stephen. He was ordered by his superiors to seek the cátedra de vísperas in theology at the University of Salamanca, which he filled on 22 November 1532 (ibid.) and kept until 1549 (D'Ors 1984, 210). Meanwhile, on 8 November 1532, he graduated from the University of Salamanca with a master's in theology (Solana 1940, 93).

In 1545 Charles V sent Soto as his imperial theologian to participate in the Council of Trent. From 1545 to 1547, Soto attended the council in Trent until – owing to political difficulties between the pope and emperor – it was moved to Bologna. Soto followed the transfer, and this time not only did he serve as imperial theologian, he was also the designated representative for the Dominicans (ibid.). During his time at Trent, Soto authored his *De natura et gratia*, which was both a response to questions being entertained at the council regarding the relationship between original sin and grace and a sustained critique of Lutheran theology (ibid., 96). In this text, Soto considers human nature in four states: first, in a state of pure nature considered speculatively (*mente excogitatum*); second, prior to the fall in a state of original justice; third, after the fall; and, finally, after the restitution of grace (*De natura et gratia*, prol., fol. 2 r-v). Ultimately, for Soto, at the

base of the dispute between Catholics and Lutherans is the role human freedom plays in postlapsarian man. Briefly put, for Lutherans, the fall resulted in the loss of true human freedom and thus necessitated certain consequences such as election or perdition (Solana 1940, 97–98). Soto, however, argued for a strong sense of human freedom, perfected by grace of course, but as the condition for the possibility of cooperating with grace in the first place (*De natura et gratia*, lib. 1, c. 15).

In 1548 Charles V appointed Soto as his confessor, which necessitated the Dominican's attending to the royal court. The emperor held Soto in such esteem that he offered the Dominican the bishopric of Segovia upon the death of its previous occupant, Antonio Ramírez de Haro (Solana 1940, 93). Soto, however, declined the offer (ibid.). Finally, in 1550 Soto returned to Salamanca to fill the cátedra de prima in theology, which had been vacated by Melchior Cano, who had recently been appointed bishop of the Canary Islands. Cano would resign the position, though, before having filled it. Soto taught theology at Salamanca until his retirement in 1556 (ibid.). Less than 4 years later, in 1560, Soto died in Salamanca at the Convent of St. Sebastian.

In addition to his significant theological contributions, Soto's contributions to the history of philosophy are many yet fall principally under three main categories: logic, philosophy of nature, and law.

Logic

Soto's works in logic include his commentary on the *Summulae* of Peter of Spain, a commentary on the dialectics of Aristotle, as well as a commentary on Porphyry's *Isagoge*. The *Summulae*, written at the behest of his superiors and friends, is the first work published by Soto (D'Ors 1984, 211). They present Soto's teaching on logic across five books in the course of his commenting on Peter of Spain's *Summulae logicales* (ibid.). Book one deals with terms; book two concerns propositions; books three and four examine opposition; and, finally, book five explores syllogistic argument forms. Soto begins his *In dialecticam Aristotelis* with an enquiry into the necessity of logic. Logic, he says, is the art of defining and reasoning, which

operations have a crucial necessity for human beings in that they alone, among all creatures, are properly rational. That human beings reason, moving from what is known to what is unknown is entirely natural. What is more, logic is necessary for the prosecution of the other sciences (*India. Arist.*, proem., q. 1). Soto then explores the scientific character of logic. Here, Soto marks a distinction between *logica docens* and *logica utens*. The former is a *habitus* that concerns how properly to form definitions, demonstrations, and syllogisms, while the latter (*logica utens*) is a *habitus* whereby those intellectual operations are put to use in particular sciences. Soto holds that *logica docens* is properly a science, whereas *logica utens* is not a science but an instrument of science. His reason for this claim is that *logica docens* is a *habitus* that generates necessary and evident assent which is simply the nature of a science (*ibid.*, proem., q. 2). What is more, in contrast to nominalist teaching, Soto holds that logic, though constituted by several partial *habitus*, is nevertheless “absolutely and simply” a single science in the same way that something can be one in a certain genus but many according to other genera (*ibid.*, proem., q. 3). Additionally, Soto thinks that logic is speculative rather than practical in nature. Although it does treat of syllogisms and other operations of the intellect, which would seem to render it practical, Soto explains that logic is properly a theoretical science since it considers the abovementioned not as acts of the intellect but considers them in terms of their own natures. That is to say, logic examines the natures of the predicaments, syllogisms, and, according to Soto, other *entia rationis* (*ibid.*, proem., q. 4). This last point leads to Soto’s final opening claim of the *In dialecticam Aristotelis* that logic has as its proper subject matter *entia rationis* (*ibid.*, proem., q. 5).

Philosophy of Nature

In his *Super octo libros Physicorum commentaria* and in an additional volume, the *Super octo libros Physicorum quaestiones*, Soto presents his philosophy of nature. In the former text, Soto offers a transcription of the Aristotelian text translated by Francisco Vatablo together with his own

commentary on the text. In the *quaestiones* text, Soto informs the reader that the principal concern is not simply to discern what Aristotle himself thought – though the philosopher is frequently cited as an authority – but to point out what the truth itself is with respect to the various points that are discussed (Solana 1940, 113). Throughout this text, Soto raises numerous questions arising from the eight books composing the *Physics* of Aristotle and offers his own answers to those questions. Natural philosophy, he claims, is “necessary” for humans in the sense that humans have a natural inclination to know (natural) things (*Super oct. lib. quaest.*, lib. 1, q. 1; p. 4E). Interestingly, Soto claims that insofar as both science and nature derive from God, one cannot attain the truth of nature – at least not with many errors – without the light of faith, for which reason, he says, Aristotle could not understand that the world had a beginning (*ibid.*, lib. 1, q. 1; p. 11A). Nevertheless, Soto still upholds the Aristotelian teaching that physics, i.e., natural philosophy, has as its proper subject matter *ens mobile* (*ibid.*, lib. 1, q. 1; pp. 14 F-15A). Among the various questions Soto raises concerning book eight of the *Physics*, some are particularly noteworthy, for example, whether it is possible for the world to be eternal (*ibid.*, lib. 8, q. 2; pp. 359ff) and whether the claim “*omne quod movetur ab alio movetur*” – so crucial to Thomas Aquinas’s *prima via* – is true (*ibid.*, lib. 8, q. 3, pp. 364ff). Soto supports the latter claim, defending it from apparent counterexamples, but answers the former question affirmatively albeit with qualification. It is possible, Soto thinks, for the heavens and their motion together with a finite number of angels and rational souls to have been created from eternity, but he denies that the species of corruptible things and the succession of individuals within those species could have likewise been created from eternity (*ibid.*, lib. 8, q. 2; p. 364B).

Law

Soto’s treatment of law is chiefly found in his *De iustitia et iure*, a treatise of ten books that explores not only the nature and principles of various kinds of law (especially in its relation to justice) but also

particular issues related to the law, e.g., dominion, contracts, property, commerce, oath-taking, etc. Book one deals with the nature of law in general as well as its division into eternal law (*De ius. et iur.*, lib. 1, q. 3), natural law (*ibid.*, q. 4), and human law (*ibid.*, q. 4). Book two explores the “Old Law,” its precepts, the Decalogue, and ceremonial prescriptions prior to transitioning to a consideration of the “New Law.” In book three, Soto examines law as the object of justice. Book four pertains to the preambles of justice in general and treats such matters as dominion and restitution. Book five treats the inverse of the immediately preceding book, namely, injustice and injury. Of particular concern here – as was the case with Francisco de Vitoria – is the issue of homicide. The remaining books of the *De iustitia et iure* narrow to particularities within the law such as usury and contracts (lib. 6), vows (lib. 7), oaths (lib. 8), simony (lib. 9), and finally matters pertaining to canon or ecclesiastical law (lib. 10).

Note on Primary Literature Soto’s philosophical works underwent numerous printings and editions. Those mentioned below represent only the ones needed for the composition of the present entry and by no means represent an exhaustive list of the various extant editions.

Sougdouris, Georgios

Born: ci. 1647

Died: 1725

Dimitrios Paradoulakis
Hamburg, Germany

Abstract

Clergyman and teacher with a broad education and a solid philological training, who developed writing activity of philosophical, philological, and theological content in the second half of the seventeenth century.

Biography

Born between 1645 and 1647 in the town of Ioannina, Sougdouris descended from a noble family of Epirus (Petsios 2002: 241–308). He received his training at the Epiphaneio School in his hometown near famous local scholars such as Spyridon Triantafyllou, and before 1672 he settled in Venice in order to gain higher education. During the years 1671–1672, he studied at the Greek School of the city near the Aristotelian scholar, eminent professor, and later Bishop of Philadelphia (1685–1713) Matthaios Meletios Typaldos. Alongside, he attended the courses of

the also prominent Aristotelian professor Nikolaos Kalliakis (1645–1707). Immediately he became a member of the newly founded Greek printing press of his compatriot Nikolaos Glykys and undertook the tasks of correcting and editing Greek texts. Through his editorial activity, Sougdouris inaugurated his public intellectual contact with his contemporary Greek scholars (professors, editors, clergy). During his stay in Venice, he composed an epigram for the collection of epic – lyrical poems entitled *Gl' allori Freggiati* – published in Padua on December 15, 1672, on the occasion of the acquisition by the Cretan Marco Franco of his doctoral degree. In the same year, he wrote the prologue to the reader in the edition of the *New Treasure* (*Néos Θησαυρός*) published by the house of Glykys and edited by the distinguished clergyman and teacher Aloisios – Ambrosios Gradenigos (c. 1616–1680). One year later he prepared the revised Greek edition of the widely distributed *Grammatica* by the Renaissance scholar Constantine Lascaris (editio princeps 1476) and contributed to the modern publication of the liturgical book entitled *Pentecostarion*. In 1678, after completing the translation of the Latin textbook of ecclesiastical rhetoric by Francesco Panigarola (1548–1594) entitled *Rhetorica Ecclesiastica*, Sougdouris enrolled in the Università degli Artisti of Padua and became the student among others of his already known from Venice Nikolaos Kalliakis and the prominent Cypriot professor of Logic Ioannis Kigalas (1622–1687). During his academic studies in the period 1678–1681, he attended courses in Mathematics, Medicine, Meteorology, and Astronomy. At the same time, he had the opportunity to deepen the study of Logic, Physics, and Metaphysics structured according to the guiding tradition of the doctrines of Thomas of Aquinas and Duns Scotus, as well as that of theology and of the exegesis of the Holy Scriptures. On March 25, 1681, Sougdouris was ordained a priest by the then Bishop of Philadelphia, Gerasimos Vlachos. The following year, he moved to Ioannina and became the new director of the local Goumas School. Remaining in his position for almost three decades, Sougdouris introduced pioneering courses of Physics and Geometry into the curriculum of the School and

taught grammar by using his own simplified *Grammatical Epitome*. In his lectures he also included theological courses and the teaching of the Aristotelian philosophy following the model and method of Theophilos Corydaleus. During the period 1695–1699, a conflict of theological nature arose between Sougdouris and the then conservative Orthodox Bishop of Ioannina Clement of Chios. The latter's thesis on the nature of the differentiation between the divine substance and the divine energy was questioned by the more progressive Sougdouris. As a result, the Bishop convened a local Council in Ioannina aiming to condemn the Greek thinker under the accusation of heresy and atheism. However, in 1699 Sougdouris addressed the Patriarchate of Constantinople and proceeded to a confession of faith in order to avoid a possible excommunication. In 1715 Sougdouris withdrew from his educational duties and died in his hometown 10 years later (September 14, 1725).

Impact and Legacy

Georgios Sougdouris's writings include various pedagogical treatises of philological, philosophical, and theological content. As the most widely used in the Ottoman occupied Greek region is considered his work entitled *Introduction to Logic* (*Εισαγωγή Λογικής*), in which besides teaching the rules and the principles of logic as science, the author developed issues related to the field of philosophy and epistemology (Marazopoulos 1998). It is noteworthy that his philosophical conception and identity had already been formed and established before his studies at the University of Padua. During his stay and activity in Venice, he completed in 1674 his *Lectures on the Philosopher's De Generatione et Corruptione* (Petsios 1999: 246–251). His argumentation remained indebted to Aristotelian philosophy, and his methodology consisted of quoting and confuting the contrary opinions and finally presenting his own views on each subject. Prior to the *Lectures* is considered his composition of an extensive commentary on the Aristotelian *Physica*, as well as more comprehensive treatises on the Aristotelian *De Caelo* and the spurious *De Mundo*. Sougdouris'

philosophical writings reflected the interpretation of Aristotle's commentators (mainly Alexander of Aphrodisias, Simplicius, Avicenna, and Averroes). Nevertheless, the Greek thinker also appeared to be under the influence of the medieval Scholastic Aristotelian tradition, with the Thomistic and Scotist doctrines having a noteworthy impact on his philosophical thought. Sougdouris's principal belief is that the interpretation and the argumentation for the questions on natural philosophy either exist adequately in Stageirites's teaching or they can be manifested in the articulation of the latter's doctrines and those promoted by his commentators, ancient and medieval. In conclusion, the interpretation of the Aristotelian philosophy which Sougdouris attempted appears to be neither the antithesis nor in full agreement with the radical Paduan perception of the late sixteenth century and the methodological model established in the Greek thought by Theophilus Corydaleus.

- the auspices of Hellenic thought, Renaissance scholars tried to define what sound is, unveiling its vibrating forces to understand its ability to shake the human body and soul. In such a way, the ever-present metaphors of harmony were much more than mere imagined, unreal thoughts: through them, Renaissance humanists shaped, organized, and understood the structure and passions of the world itself.

Heritage and Rupture with the Tradition

What is sound? What is its nature? What is its sense? These and other questions about sound have had great relevance in Western thinking since ancient Greece (Barker 1989; Mathiesen 1999; Hagel 2010). We can find eloquent examples of such problematics in writings of many philosophers, from Plato and Aristotle to Church Fathers like Isidore or Augustine. Writing from his platonic background, Augustine, an author frequently cited and paraphrased during the Middle Ages and the Renaissance, cleverly posed several important issues concerning sound in a brief passage of his *Enarrationes in Psalmos*: "One who jubilates does not utter words, but it is rather a kind of sound of joy without words; for the voice is thus the soul dispersed out in joy, demonstrating as much as it is able the feeling without grasping the sense" (1990).

Trying to explain what sound is and does, Augustine evokes a dichotomy that will be a recurrent theme throughout the history and philosophy of music: "music" and "words," "sound" and "meaning," in the end (Dillon 2012). In his commentary, the voice has to make words audible (*cantus*) and unambiguously communicate the meaning of them (*res*) at the same time: therefore, at the very core of the problem is language. By focusing language's conundrum from a musical standpoint, Augustine articulates the disconcerting tension between both, sense and sound. But we must not overlook that, for him, such a way of singing fully outdoes language, making music an ideal vehicle to feel and communicate with God and, consequently, a field to reflect upon and through it. Later, the finding of a complete copy of Quintilian's *Institutio Oratoria* by Poggio Bracciolini in 1416 would give new impetus

Sound in Renaissance Science

Carlos Gutiérrez Cajaraville
Historia y Ciencias de la Música, Junta de Castilla y León and European Social Fund Fellow,
University of Valladolid, Valladolid, Spain

Abstract

Sound, basically characterized as air in motion since ancient Greece, has been at the core of the theories of many philosophers, as well as musicians, poets, scientists, and theologians. Under

to rethink the conflation of sounds/music with words/sense.

Since the thirteenth century, musical thinking was strongly influenced by ancient texts, due to the discovery and study of complete and authoritative testimonies of Greek theory. Well-known humanists like Giovanni Pico della Mirandola or Giorgio Valla collected manuscripts, published translations, and wrote commentaries that molded the understanding of ancient writings. Certainly, one of the figures whose ideas about sound influenced philosophers and musicians over centuries was Pythagoras. His relevance for the study of the subject in general, and particularly for music, resides firstly in his claimed establishment of the numerical base of acoustics. As told by Nicomachus (1994), Pythagoras determined the arithmetic ratios of intervals after listening to how hammers of different weights played consonant and dissonant sounds while he was walking near a forge. Secondly, but closely related, are the Pythagorean beliefs in a universe ordered by the same numerical proportions that produce musical harmonies, the so-called music of spheres.

From all the conceptions of sound based in Pythagorean and neo-Pythagorean accounts which Renaissance scholars usually knew, basically through translations made by Latin writers like Boethius (1867) (*De Institutione Musica*), it is worth noting two Platonic myths that had a long-lasting impact: in the first one, the explanation of the creation of the World-Soul is accomplished using Pythagorean proportions (*Timaeus*). In the myth of Er (*Republic*), Plato described the universe as a set of concentric rings on the surface of each of which a Siren sits singing (questioned by Aristotle 1995). Together they produce the harmony of spheres, a harmony created by difference, *discordia concors* (Haar n.d.). Due to the Hellenic inheritance, the concept of sound in the Renaissance was not only “a particular movement of air” (Aristotle 2011) but a way to explain, order, and, ultimately, make sense of the world and the whole universe (Godwin 1987, 1993). Such Pythagorean ideas were constantly reworked by Neoplatonist scholars until the end of the Renaissance.

Innovative and Original Aspects

Aristotle’s sparing definition of sound mentioned above has, nevertheless, two fundamental terms, words repeated time and again when an explanation of sound had to be proposed: air and movement. That fact can be seen perfectly clear in the theoretical works of Marsilio Ficino, one of the Renaissance thinkers most interested in scrutinizing the effects and influence of sound and music on the spirit (Ficino 1959; Tomlinson 1993; Prins 2014). Let me start with air, the first keyword. Integrating Neoplatonism with Aristotelian doctrines, Stoicism with medical thinking, in *De vita libri tres*, Ficino provides a glimpse of his notion of spirit: “almost not a body but a soul; or again, almost not a soul but a body” (1989). It is, of course, a ghostly image of the spirit, characterized as an airy substance lying in between the incorporeal soul and the corporeal body. It acted as a fundamental nexus, transmitting the vibrant force from the soul to the body and sending the corporeal spurs to the soul. Also in *De vita*, Ficino constantly related sounds and music with air or airy vapors and scents. In other words, spirit and sound, sound and spirit, were made of the same substance, so it is easy to grasp why sound and music could move the spirit.

Move. This leads me to the second term: movement, motion. In fact, this issue has been already raised with the air. By acting as connection of the body with the soul (and vice versa), the spirit had to remain in constant movement. Likewise, sound was not only air but air dynamically and lively set in motion. At this point, we should remember Plato’s dialogue concerned with the movement of the soul, where he states that *mousikē* and *philosophia* provide the soul with motion, and when this motion has been properly regularized, it joins high and low sounds resulting in an “imitation of the divine harmony revealed in mortal motions” (*Timaeus*). Although Plato’s theory surely was the basis of Ficino’s one, he increased the complexity of the subject. From his perspective, the movement of music could emulate human gestures, affections, or even the heavens: it was capable to imitate anything. The sound of music, therefore, was not only able to move and to

enact passions, but it also had the capacity to mimic the most meaningful and rational motions.

Ficino was by no means the only one who apparently broke with the primacy of the visual in favor of sound and hearing. In a dialogue on the theme of love called *Gli asolani*, the Italian literary theorist and poet Pietro Bembo, always concerned with the sound of the words, praised hearing for being the sense by which we can perceive the beauty of the soul. Persuasion, according to Bembo, was encouraged by an occult force of the words, a power caused by their natural properties (Bembo 1961). Ignatius of Loyola could have thought something similar about the power of sounds to persuade (Filippi 2015): meant to be read out loud, the fifth of his *Spiritual Exercises* encouraged Counter-Reformation Catholics to meditate about Hell by “hearing wailings, howlings, cries of sinners” to get an “interior sense of the pain which the damned suffer” (Schwartz 2011). “Nihil est sine numero sonoro,” Luther *dixit* (1965).

We have already talked about what sound is and why it could powerfully affect human body and soul. But how could sound produce these effects? I think we have to find the possible answers in music. On the one hand, music treatises from the end of the fifteenth to early seventeenth centuries usually emphasized the correlation of each of the modes (scales formed by a distinctive distribution of their sounds) with a particular *ethos* (Gaffurius 1492, 1496). Although it was very far from its original conception, such a Greek term generally shows the belief, shared by many Medieval and Renaissance scholars, that music can carry, enact, or even impose a specific mood on human beings. As the Renaissance tradition was by no means systematic, let us see as an example the conception of the third and four modes, Phrygian and Hypophrygian, as established by Spanish theorist Bartolomé Ramos de Pareja (1990). The Phrygian mode, which is associated by Ramos de Pareja with the yellow bile, increases cruelty and anger. By contrast, music composed in the Hypophrygian mode weakens it and so on for each mode, which, in Ramos de Pareja’s theory, were also linked to planets, colors, and muses.

On the other hand, we should not forget music’s mimetic capacities. Sixteenth-century composers and poets began to explore the wide variety of sympathies existing between text and music (Zarlino 1573; Montanos 1592; Salinas 1977). In the words of the Spanish music theorist Juan Bermudo: “. . . everything said in the text can be imitated in music. . . the notes should be put down so, in everything and for everything, they are very much in agreement with the text.” As we have seen before, words (as a sonic force) and music had a similar ontological status due to their airy and dynamic nature. So, blending both together would make them an overwhelmingly effective medium not only to reflect things on the imagination, as Giordano Bruno would say, but also to pierce the soul (Bruno 1991).

Impact and Legacy

As he continued discussing the relations between sound and word, music and rhetoric, in his astonishing *Musurgia Universalis* (1650), Athanasius Kircher included a plate representing Pythagoras, who looks at the reader while signaling an ear-shaped forge (Godwin 1979). Inside it, the hard-working blacksmiths are sounding the anvil, the apparently artless object through which the philosopher’s thoughts about sound were filtered, ideas that constituted the basis for speculative as well as scientific approaches to the issue for centuries. In Kircher’s sonorous thinking survived the Pythagorean ideal of the numerical relations of sounds, the *numerus sonorous*, an ideal underpinned, as we have seen, by entire generations of musicians and philosophers, from Johannes Tinctoris (Wegman 2005) to Gioseffo Zarlino (1573), from Marsilio Ficino to Robert Fludd.

Although the validity of traditional arithmetic ratios remained apparent and influential, since the second half of the sixteenth century, almost all the great philosophers and scientists of the time devoted empirical attention to the subject of sound (Burnett et al. 1991; Pasnau 2011). For thinkers like Girolamo Fracastoro, G. B. Benedetti, Vincenzo and Galileo Galilei, Johannes Kepler,

Francis Bacon, Marin Mersenne, or René Descartes (Descartes 1984; Stephenson 1994), one of the main areas of inquiry was the nature of pitches, precisely the domain where Pythagoras had a major impact. These philosophers displaced the issue from the Pythagorean view to a perspective based on physics (Taylor and Campbell n.d.). In this sense, in 1546 Fracastoro argued that pitch depends on the frequency of impulses transmitted through the air, by sequences of alternating condensations and rarefactions that produce a wave-like motion. On the other hand, Benedetti is considered to have been the first to relate the sensations of pitch and consonance to vibration frequencies (1563).

Other examples were the empirical studies of Vincenzo Galilei, father of Galileo, who demonstrated that the simple numerical ratios that constitute the consonant intervals in pipes and string lengths were not valid for the relative weights of hammers nor for the relative volumes of pipes. He also exposed that, the length of a string held constant, but changing its other parameters, such as tension or material, resulted in alterations in its perceived pitch. Supporting an empirical science of music perception, anticipating many contemporary psychologists, Galilei argued that disputes over tuning systems were futile, since the small differences that are at issue were not perceivable (Taylor and Campbell n.d.).

These studies cemented the way for a new mode of empirical investigation of pitch and sound perception (Erlmann 2010). Following this path, Galileo realized that pitch corresponds to frequency and showed that musical intervals could be uniquely characterized by frequency ratios. In order to demonstrate this fact, Galileo had to do a fundamental shift of perspective, considering not the sound produced by the vibrating object but the sound that reaches the ear. He also made the clearest presentation of the relation between pitch and frequency, elucidating why some intervals are more consonant than others.

However, the empirical study of sound wouldn't have been the same without the figure of Marin Mersenne, whose *Harmonie Universelle* (1636) is a landmark in the history of the issue. Mersenne, who went so far as to claim that "all

movements that occur in the air, in water, or elsewhere, can be called sounds, inasmuch as they lack only sufficiently delicate and subtle ear to hear them," designed an ingenious experimental method by which he demonstrated that the vibration frequency of a string varies inversely with its length. Furthermore, he was able to relate the sensation of pitch to vibration frequency and to estimate the vibration frequency of a particular pitch. Moreover, he was interested in the phenomenon of beats and overtones, anticipating later studies on timbre. These empirical investigations form the basis of later inquiries about sound, such as Newton's mathematical analysis of the propagation of sound or Euler's work on overtones (Newton 1999).

Abstract

Lelio and Fausto Sozzini, uncle and nephew, were two of the main exponents of sixteenth-century Antitrinitarianism. Their thoughts, especially Fausto's elaboration of Lelio's suggestions, became a point of reference for both

Italian religious dissenters and members of the Minor Reformed Church (*Ecclesia Minor*) in Poland. After Fausto's death (1604), his ideas were spread across Europe by several followers and gave rise to Socinianism, which emerged as one of the most important religious, moral, and philosophical doctrines of early modern times.

Alternate Names

Socini; Socinus

Biography

From the beginning of the fifteenth century, the Sozzini family, based in Siena, was famous in the domain of juridical studies, to such an extent that Pierre Bayle, for instance, dedicated to the illustrious juriconsult Mariano Sozzini (1401–1467) a specific entry in his *Dictionnaire historique et critique* (Bayle 1740, 4, 226–227). His grandson Mariano Sozzini junior (1482–1556), the father of Lelio and Alessandro, the father of Fausto, continued the family tradition and taught law in Siena, Padua, and Bologna. For this reason, Lelio, who as a child followed his father in Padua and then in Bologna, was supposed to embark on the same career. However, at the beginning of his studies in Padua, he encountered the radical reformed thought that was already widespread in Italy – in Siena with Bernardino Ochino, in Padua with Matteo Gribaldi and Celio Secundo Curione among others – and especially in Veneto, thanks to the (relative) freedom of religion that the Republic of Venice allowed in its territories (Stella 1967). In Padua, and then in Bologna, to which he moved in 1542, Lelio transferred from juridical to theological studies with such passion and devotion that he started to learn Hebrew to read the source of the Scripture (Rotondò's introduction to Sozzini 1986, 27–28). In 1547, after 3 years of religious discussions in the intellectual radical circles of Siena, Padua, and Bologna, Lelio adhered to the Reformation and began to travel across Europe, from the Valtellina to the canton of

Graubünden, from Basle to France and England, until he reached Geneva and then Zurich (Taplin 2003), where he met John Calvin and Heinrich Büllinger, Zwingli's successor (Cantimori 1939). At this time, probably in 1549 and as a consequence of his discussions with Calvin on the subject, Lelio wrote a treatise on the resurrection of the bodies (*De resurrectione*, Sozzini 1986, 75–80) in which he cast doubt on Calvin's opinions (Sozzini 1986, 321–326). In 1550 he enrolled at Wittenberg University and made acquaintance with Melancthon. He did not stop there and continued his rise in Wien, Prague, and Kraków, where he made contact with the local Antitrinitarians, such as the physician Giorgio Biandrata. Lelio ceaselessly questioned several Christian standpoints, for example, the role and value of the sacraments (*De sacramentis dissertatio ad Tigurinos and Genevenses*, 1555, Sozzini 1986, 81–92), and also for this reason he was asked by Büllinger for a declaration of faith, which did not completely persuade Calvin and his fellows, despite its coherence with the reformed doctrine (*Confessio fidei*, 1555, Sozzini 1986, 93–100). Besides a short trip for financial reasons in 1552 – the Roman Inquisition had become very interested in Sozzini's family – Lelio remained in voluntary exile for most of his life. In 1559, he arrived for the last time in Zurich, where he wrote, perhaps in 1561, his most important work – *Brevis explicatio in primum Iohannis caput* (Sozzini 1986, 101–128). He died 3 years later after a wandering life of exchanges and debates with the most important Reformation exponents and dissenters of his time.

Fifteen years younger than Lelio, Fausto was educated in an environment that increasingly mirrored the reformed thought; his uncles Cornelio and Dario had been tried in Rome by the Roman Inquisition for their sympathies toward the Reformation, and there were many suspicions about their brother Celso (Marchetti 1975, chs. XIII, XIV). Nonetheless, Fausto did not seem to have any interest in religious questions during his youth, which he passed dedicating himself to literature and poetry (Sozzini 2005) as a member of the Accademia degli Intronati at Siena, which he joined in 1555 with the name of “Frastagliato”

(Sozzini 2004, X). In 1561, Fausto left Italy for Lyon, partly through fear of the Inquisition's increased attention towards Italians who sympathized with the Reformation, and partly in order to handle his economic interests and those of his uncles Celsio, Cornelio, and Camillo, who participated and had titles in Lyon's agency of the Lucca merchants Buonvisi and Micheli (Rotondò 2008, 212). When he learnt that Lelio had passed away, Fausto traveled to Zurich to collect his uncle's papers and then went to Basle, where he encountered Sebastian Castellio and wrote his *Explicatio primae partis primi capituli Evangelistae Johannis*, inspired by Lelio's work (Sozzini 2004, I, 73–85). Between 1563 and 1575, Fausto lived in Italy, under the protection of the Grand Duke Cosimo de' Medici and, from 1574, of Francesco I. From 1569 to 1573, he worked as a secretary for Paolo Giordano Orsini and his wife Isabella de' Medici, who protected him from the suspicions of the Inquisition (Marchetti 1969). Until 1578, he was in Switzerland, where he faced his first two theological discussions, one on the role of Christ in salvation with Jaquet Couvet (*Disputatio de Jesu Christo Salvatore*, published in 1594, Sozzini 2004, II, 115–252) and the other with Francesco Pucci on the condition of Adam before the fall (*De statu primi hominis ante lapsum disputatio*, 1610, Sozzini 2004, 253–270). At the end of 1578, Fausto arrived in Transylvania at the invitation of Giorgio Biandrata to argue against the non-adorantist position of the Unitarian Ferencz Dávid (Kot 1937). In 1579, after the death of Dávid, who had been imprisoned because he refused to recant, Fausto arrived in Poland. Here, he soon became the leader of the Minor Reformed Church, the Polish Brethren, mostly because of his sharp discussion skills and moderation of several burning issues, such as the baptism of adults and the relationship between Christians and social and political life (Szczucki 2005; Kot 1957). In 1586, he married Elisabeth Morsztyn, daughter of the nobleman Krzysztof who hosted Fausto in Pawlikowice from 1583 to 1587, and in 1587 became father to Agnese, the future mother of Andrzej Wiszowaty (1608–1678). In the same year, Francesco de' Medici died and Fausto lost

his last protection against the Roman Inquisition. Consequently, in 1590, the Holy Office in Siena seized all his assets and from then on Fausto could not count on anything but the support of his father-in-law and his followers (Szczucki 2001). In the final decade of the sixteenth century, Fausto devoted himself to deepening his thoughts on Christ, on the doctrine of atonement, and on the main principles of his faith, and to protecting the Minor Church from attacks by the Jesuits, who were extending their influence in Poland. In 1594, he was assaulted in Kraków, then more violently 4 years later, when some students, perhaps Catholic, broke into his house and destroyed most of his papers and books, among which was a lost treatise on atheism (Pioli 1952, 169–174). This event led Fausto to move from Kraków to the village of Lusławice, where he stayed until his death (3 March 1604), writing the basis of the future Catechism of Raków, published in Polish in 1605 and soon translated into German (1608) and Latin (1609), and several essays on the Church, the Supper, and the New Testament.

Heritage and Rupture with the Tradition

The thought of Lelio and Fausto Sozzini belonged to the movement of people and ideas that distinguished the second half of the sixteenth century. As is well known, the Italian situation in relation to the Reformation was extremely peculiar (Firpo 1993): Italian religious dissenters' famous – and discussed – nicodemism (Ginzburg 1970) did not keep them from being identified, controlled, and persecuted by the religious authorities (Rotondò 1967). As a result, most of them were obliged to spend their lives in a more or less voluntary exile in countries like Switzerland or those in East Europe in which the reformed thought seemed not yet wholly constituted, and were therefore more open to discussions and different opinions (Wilbur 1947). In this sense, Lelio and Fausto's lives clearly illustrate the complexity of the networks of dissenters that connected philosophers, theologians, jurists, physicians, and academics across Europe in the sixteenth century (Celati 2018).

With regard to the Italian cultural tradition, it has to be remarked that both Lelio and Fausto were acquainted with the philology of Lorenzo Valla and the Paduan Aristotelianism and thus with the critical attitude towards several aspects of the theological tradition, such as the notion of “persona” or the immortality of the soul (Cantimori 1939; Stella 1983). These elements, along with a sincere and genuine religious sentiment, led Lelio and subsequently Fausto to continuously analyze and discuss the Scripture, looking for a correct, rational reading of those themes that had to their eyes a strict connection with ethical behavior, which according to them was the real scope of God’s revelation. In this sense, Lelio, but mostly Fausto, tried to break the deadlock in which the reformed church, especially the Calvinist Church, seemed to be stuck because of its restriction of the interpretation of the Scripture to the pastoral body and its inability to redefine the Christian dogmas aimed at bringing back to light the evangelical message (Marchetti 2005). The first, and probably the main, result of their engagement can be found in the explanations of the prologue of John’s Gospel, which, by claiming the humanity of Christ against the metaphysical reading of the *logos*, brought about a rupture in the reformed thought.

Innovative and Original Aspects

The question of the Trinity, of its coherence and its truth, was widely diffused amongst the first generation of reformed thinkers (Biagioni 2016). Lelio and Fausto’s novelty lies in their inserting of this topic within a larger discussion on the humanity of Christ. This point, which distinguishes Socinianism from other confessions, was stated in Lelio’s *Brevis explicatio* and eventually deepened by Fausto through a particular reading of the well-known *incipit* of John’s Gospel “Ἐν ἀρχῇ ἦν ὁ Λόγος, καὶ ὁ λόγος ἦν πρὸς τὸν Θεόν, καὶ Θεὸς ἦν ὁ Λόγος” (“In the beginning was the Word, and the Word was with God, and the Word was God”) (Rotondò’s *Nota critica* in Sozzini 1986, 347ff). According to Lelio and Fausto the “logos” is nothing but the discourse, the speech of

God (“sermo”, as Valla and Erasmus had already indicated, and not “verbum” as traditionally stated – Domański 1974), which was preached by a real, finite, man: Christ. This tenet is confirmed by the sentence “ὁ Λόγος σὰρξ ἐγένετο” translated by Lelio and Fausto as “the Word *was* flesh,” and not the traditional “the Word became flesh” (Marchetti 2005). In Fausto’s opinion, the misunderstanding of the real meaning of John’s Gospel was a result of the influence of Plato’s philosophy on the Christian doctrine, which had then to be purged of these metaphysical interferences through a historical and philological analysis of the Scripture (Scribano 2007). A different translation was also proposed by Fausto for the Gospel’s opening words “In the beginning,” which in Sozzini’s opinion could not mean “from eternity” since Christ, being a man, did not preexist the creation. These words indicated only the starting point of human history, of the road to salvation that Christ showed us through his behavior and his preaching (*De Jesu Christo Servatore*, Sozzini 2004, II, 119–246). This does not imply that Christ must not be venerated: on the contrary, as Fausto clearly explained in *De Jesu Christi invocatione disputatio* against Dávid (1579), since Christ received from God the supreme power over human beings, we have to give him the divine worship. In this sense, Christ is our savior not because his death was the atonement for human sins – which are individual and personal – but because by resurrecting he revealed the right way to trust in God (Osier 1996). As we read in the Catechism, to trust in God means to obey him, and therefore to act according to the ethics preached by Christ. As a result, in the Socinian view, there is no distinction between faith and works (Crell et al. 1680, chap. 9, sec. 6), which can be accomplished through the intact freedom of human beings. As Fausto argued against Francesco Pucci (*De statu primi hominis ante lapsum*, Sozzini and Pucci 2010; Biagioni 2005), the reward for following God’s word is to become immortal, returning to the condition of Adam before the sin and of Christ after his death. Such interpretations of the Scripture were attained by Fausto through a peculiar form of rationalism, which intended to read the Bible by

means of a critical and rational analysis that showed and refused the illogical dogmas supported by the tradition, dogmas such as the Trinity (Ogonowski 1974), the infinity of God (Angelini 2017), the predestination, the original sin (Simonutti 2005b), and the creation *ex nihilo* (*Praelectiones theologicae*, Sozzini 2004, 585). In Fausto's account, human reason is perfectly adequate for the task of understanding religious truths, which can be above reason, but never contrary to it (Salatowsky 2015). However, as Fausto wrote in *De Sacra Scripturae Auctoritate* (Sozzini 2004, I, 263–284), the source of religious truths is the sole Scripture in which, therefore, all we need to be saved can be found (Cantimori 1939). Moreover, according to Fausto, what is important for salvation is not really a set of specific doctrines, but rather the ethical message praised by Christ. As a consequence, Fausto not only considered the number of doctrines that must be professed as very limited, but also created the conditions for a notion of tolerance that became, in the seventeenth century, the distinctive feature of the Socinian movement (Pintacuda de Michelis 1975; Ogonowski 2005).

Impact and Legacy

From the beginning of the seventeenth century, because of the rise of counter-reformation and as a consequence of the 30 Years' War, the Polish Socinians, the followers of Fausto, found themselves in a difficult situation. The first wave of persecutions reached a climax in 1638 with the destruction of the Socinian center at Raków, "the Sarmatian Athens" (Williams' introduction to Lubieniecki 1995), which hosted a school and a printer house. Twenty years later, in 1658, a decree imposed on all "Arians" demanded that they leave Poland by July 1660, giving rise to the Socinian diaspora (Wilbur 1947). Most of the Socinians fled to Holland (Bayle 1740, 4, 228–237), where their writings had circulated since the 1580s, despite the prohibition of the Dutch States General, and they were received favorably by the Arminians (Mulsow and Rohls 2005). In 1668 – but with the evocative date "after

1656" in order to remember John II Casimir's vote to expel Unitarians from the country (Wilbur 1947) – in Amsterdam – renamed Irenopolis, "Peace City" – Andrzej Wiszowaty promoted the publication of the most important works of the Polish Brethren, the *Bibliotheca Fratrum Polonorum* (Kuyper et al. 1668), whose first two volumes contained the writings of Fausto Sozzini. The publication of *Bibliotheca* increased the debate and the circulation of Socinian thought, which became a synonym for every form of religious rationalism. This reading did not depend only on the polemical interpretation of Socinianism driven by its opponents, but also on the positions held by the second generation of Socinians: Johachim Stegmann (1595–1633) and Andrzej Wiszowaty, for instance, in their books *De iudice and norma controversiarum* (1644) and *Religio Rationalis* (1676–1678) stated that reason is the sole judge in theological controversies (Salatowsky 2017). As has been noted, this attitude deeply influenced the thought of philosophers such as John Locke (Simonutti 2005a; Marshall 2000) and Isaac Newton (Snobelen 2005) and has been viewed as a source of eighteenth-century Deism (Israel 2006). The history of Socinian rationalism clearly shows the changes that occurred from the times of Fausto Sozzini: in fact, although Sozzini was diffident towards systematic and rational theology, his followers, from Johann Crell (1590–1633) to Noël Aubert de Versé (1645?–1714), attempted to build up an organized set of doctrines that they hoped would become a real alternative to the great philosophies of the seventeenth century (Scribano 2005).

Species, Intelligible

Leen Spruit

Faculty of Arts and Center for the History of Philosophy and Science, Radboud University Nijmegen, Nijmegen, The Netherlands

Abstract

The doctrine of intelligible species formed an integrating part of the heritage of Scholastic philosophy handed down to the Renaissance. A large number of authors now applied themselves to the notion of species, defending, revising, or rejecting it, as the case might be, including fifteenth-century Platonics, the larger part of Renaissance Aristotelians, and exponents of late sixteenth-century naturalism.

Innovative and original aspects

Contributors to Renaissance discussions on the intelligible species can be divided into three rough classes, namely, Peripatetics, Neoplatonics, and a group of relatively independent authors, who most of the time were not attached to a university. Peripatetic philosophers and Scholastic authors often repeated medieval views and ideas. Yet, they also sought to apply new philosophical arguments and newly developed philological methods to defend (or to question, as the case may be) the intelligible species. By the turn of the fifteenth and the sixteenth century the Peripatetic camp was divided by profound controversies. Some authors, such as Alessandro Achillini and Tiberio Bacilieri, were openly skeptical about the need for intelligible species, yet without attacking the doctrine head-on. Other philosophers, such as Agostino Nifo, were of an essentially vexed

disposition, endorsing the notion of intelligible species only as the outcome of their tardy refutation of Averroist noetics. These ambivalent positions elicited an explicit defense of the species by (Pietro Pomponazzi 1966–1970, II, pp. 177–210) and (Marcantonio Zimara (Zimara s.a.), who in turn induced the opposition by Girelli (Girelli 1561) and Porzio during the 1540s and 1550s.

Unlike the professional philosophers, the precursors of the Second Scholasticism, such as Caietanus and Ferrara of Sylvester, did not question the concept of the intelligible species as such. Their aim was rather to clarify some problematic aspects of it, with particular attention to the relation between agent intellect and sensory representation. Subsequently, some Renaissance Peripatetics took up a suggestion made by Nifo, namely, to conceive of the intelligible species as *notio*. This decision was much more than a philological reorientation with regard to Aristotle's text. At the doctrinal level, it entailed a tendency to detach the reflection about representational entities or principles from the physicalist framework of Aristotelian psychology. Thus, it paved the way for a theory of mental content and its linguistic expression that is able to skirt the ontological issue of the species' exact nature.

In the Neoplatonic camp, Marsilio Ficino and Giovanni Pico della Mirandola attempted to integrate conceptions of Scholastic authorities within an essentially Neoplatonic framework, while Marcantonio Genua's *De anima* commentary was a unique attempt at harmonizing the noetics and psychology of Averroes and Simplicius. This type of reflection prepared the way for the ultimate substitution of the intelligible species by the concept of "idea" in early modern philosophy.

Early attempts to reflect on the problem of formal mediation in intellectual cognition, relatively independent of school tradition, can be found in the works of Charles de Bovelles and Girolamo Fracastoro. No genuinely revolutionary attempts were made to solve the problem of knowledge acquisition until Bernardino Telesio, whose rigorous naturalism constituted the first non-Platonic alternative to Aristotelian psychology. Among the later independents was also Giordano Bruno. In

terminology and conceptual setting, however, his psychology did not break with the traditional schools as violently as that of Telesio.

The traditional doctrine of intelligible species presupposed a ternary relation between a representation that gives the mind an intelligible content and that grounds the mental *act*. In the course of the Renaissance disputes, a whole variety of meanings and functions were attributed to the species. With some notable exceptions, the framework for discussing the species was generally still that of representation, content, and act. In contradistinction to the Middle Ages, it is remarkable to note how few authors of the Renaissance (Pomponazzi, Zimara, Ferrara, and Javelli) took the intelligible species as mediate and unknown mental representations, distinct from both content and cognitive act. Most often the species were assimilated to either the known object or to the cognitive act, and sometimes to both. As noted earlier, the intimate connection of mental act, representation, and content was to be a crucial feature of seventeenth-century theories of ideas. Highly significant from a historical point of view was the interpretation of species as idea or notion in the Renaissance debate.

Renaissance Aristotelians only rarely abandoned the sense-dependence of cognition. Still, the traditional view was criticized from several directions. In discussions of the mind's "subjective" and "objective" reception of species and objects, respectively, it frequently happened that writers swerved from the physicalist framework of Peripatetic psychology. This applies in particular to critics of the species doctrine, who explained the generation of knowledge in terms of a mental or cognitive response to sensory stimuli.

The nativist interpretations of Aristotelian psychology opened up a new outlook on knowledge acquisition. Many Renaissance authors endorsed a traditional Platonicizing style of nativism with regard to content and held that the actualization of the mind's innate contents is only occasionally dependent upon the phantasms. They either rejected sense-dependent intelligible species or simply assimilated them to innate contents.

The Renaissance discussions on cognitive psychology in general, and the dispute on intelligible species in particular, made significant

contributions to philosophy on the following points: the nature and function of (un)conscious principles involved in the cognitive process; the role of innate dispositions or contents in the generation of knowledge; the relation between the simple apprehension of undivided objects; and the mind's conscious and discursive operations.

led to a shift away from the traditions of medieval religious drama. Works such as *De re aedificatoria* by Leon Battista Alberti and the *Secondo libro di Prospettiva* by Sebastiano Serlio aimed to create a harmonious fusion of classical elements and innovation resulting from the use of perspective in stage design. Over the course of the sixteenth century, theatrical machinery and staging then became increasingly complex and spectacular all over Europe. Finally, alongside practical scenic solutions came the development of theories of spectacle, such as those of Giambattista Giraldi Cinthio, Leone de' Sommi, and Angelo Ingegneri.

Heritage and Rupture with the Tradition

During the Middle Ages, performances mainly fell within the sphere of religious ceremonies, and scenography was as well closely related to religious themes. Regarding the scenographic process and dramaturgical elements, a progressive distancing from the traditions of medieval religious drama accompanied the renewed interest in classical antiquity that characterized Humanism and the Renaissance and involved buildings and plays as well as treatises on poetics (to which dramatic art assigned a prominent role) and architecture.

Perusing Vitruvius' *De architectura* inspired Leon Battista Alberti to draft a new treatise that adapted the precepts of the Roman architect to the changing times: this work was *De re aedificatoria*, written between 1443 and 1452 and published posthumously in 1485. In book VIII, Alberti lists the basic structural constituents of the theater itself, again taking up elements of the classical stage – the so-called stage front – such as the central entrances, but introducing the presence in the background of a city landscape with the houses of the characters. This heralded the scenography of theatrical performances held a few decades later at the court of Ferrara, following the indications of Pellegrino Prisciano, translator and commentator of Alberti's text.

Spectacle in Renaissance Theater

Laura Carotti

Abstract

During the Renaissance, the rediscovery of the buildings and plays of classical antiquity, as well as ancient treatises on poetry and architecture,

A painted backdrop also characterized the performance of Ludovico Ariosto's *Cassaria* in Ferrara: it was a new type of scenery, created "syntactically," and very far from the medieval sort, which was structured in a linear way as a succession of places. Also thanks to the use of perspective, stage design was now able to unite different environments in an overall view.

An effective theoretical synthesis between Vitruvian precepts and the use of perspective is the *Secondo libro di Prospettiva* by Sebastiano Serlio 1545. The best architectural example of this approach is the Teatro Olimpico of Vicenza, designed by Palladio, in which the three entrances of the classical stage front and the linear perspective of Renaissance tradition are present simultaneously.

During the sixteenth century, stage machinery and theatrical productions became increasingly complex and detailed; notable in Florence were Bastiano da Sangallo, nicknamed "Aristotle" for his skill, and Bernardo Buontalenti. The sixteenth-century taste for spectacle was particularly expressed in the interludes, unrelated interruptions in performances absent in classical theater, allowing the creation of forms of entertainment freed from the Aristotelian unities of time, space, and action.

Real theoretical formulations began to appear regarding theatrical performance, such as those by Giambattista Giraldi Cinthio, Leone de' Sommi, and Angelo Ingegneri. In his 1543 *Lettera sulla tragedia*, which precedes *Orbecche*, Cinthio reinterprets the instructions of Aristotelian poetics, conferring new value on stage design, which must be perfectly consistent with the text performed. However, the first real director's manual was *Quattro dialoghi in materia di rappresentazioni sceniche* by Leone de' Sommi, written in the late 1560s and early 1570s. Here the author, who also had direct experience as a choragus, illustrates a precise method for theatrical staging, combining practical directions with psychological and theoretical comments (e.g., the lighting is considered to be useful for the representation of the characters' personality traits). Angelo Ingegneri also had experience in staging;

he supervised *Edipo re* at the Teatro Olimpico in Vicenza in 1585 and later in 1598 published *Della poesia rappresentativa e del modo di rappresentare le favole sceniche*, a treatise that censured those who care only about the literary construction of plays and praised dramatic transposition.

The diverse European panorama was a multifaceted reflection of the Italian experience. In England, thanks to the records of the Revels Office, which oversaw court festivities – and would later become the authority responsible for stage censorship – we note the increasingly complex stage design, in which the spaces were divided in a rational manner and the scenography displayed large curtains. Examples of this are John Lyly's plays, in which the scenes were constructed with multiple staging, and William Shakespeare's *Comedy of Errors*, in which the various locations where the story unfolds are suggested to the public through painted backdrops indicated by signs. The first building to be used solely for paid public performances was The Theatre, designed and built by James Burbage and inaugurated in 1577. However, the most famous of all was the Globe, built in 1599, where Shakespeare's company performed. At the end of the 1500s, permanent theatrical sites were also created in Spain; these *corral de comedias* were set up within courtyards. Paris' first permanent theater, the *Théâtre de l'Hôtel de Bourgogne*, was built in 1548 by the Confrérie de la Passion, a group of traders and craftsmen who had a monopoly on theatrical performances in the capital. A particular feature of this building was its narrow stage, further narrowed by the presence of multiple sets. Also noteworthy in the French context was the staging of ballets that mingled performances, music, singing, and dancing, and the precision of the stage sets corresponded to the extreme refinement of the costumes and stage machines. Thanks to its mythological subject and luxurious staging by Baldassarre Baltazarini da Belgioioso, worthy of mention is the *Ballet Comique de la Reine*, performed in Paris in 1581 at the court of Henry III and in the presence of the Queen Mother, Caterina de' Medici.

Spenser, Edmund

Born: ?1552, London

Died: 1599, London

Malcolm Hebron

Winchester College, Winchester, UK

Abstract

Edmund Spenser was one of the great poets of the Elizabethan era. His work draws on native, classical, and European traditions. The clearest example of Neoplatonism in Spenser's writing comes in the *Fowre Hymnes* (1596). The first two of these, addressed to Love and Beauty (Cupid and Venus) present conventional depictions of the Platonic gaze ascending from the material to the intelligible realms. The second two, addressed to Christ and Sapience (Christian Wisdom), integrate Platonic ideas with Christian doctrines.

Biography

Edmund Spenser (c. 1552–1599) was one of the great poets of the Elizabethan age (Hadfield 2004). He was educated at Merchant Taylors' School, where he was taught by the humanist Richard Mulcaster and Pembroke Hall, Cambridge (matriculated 1569, BA 1573, MA 1576). At Cambridge he wrote poetry and studied Latin, Greek, French, and Latin and probably other languages, too. Spenser secured a place in the household of the Earl of Leicester and was acquainted with Sir Philip Sidney and other poets. In 1580, he was appointed secretary to Lord Grey of Wilton, Lord Deputy of Ireland. His most notable poetic works are: *The Shepherds Calender* (1579), a set of eclogues on classical models; the sonnets of the *Amoretti*, and the wedding celebration "Epithalamion"; and the vast (though unfinished) allegorical epic *The Faerie Queene* (1590–1596), a glorification of Elizabeth and an exploration of the virtues, which are examined through chivalric adventures (Spenser 1989). Models for this work

include Virgilian epic, the Italian Renaissance epics of Tasso and Ariosto, and native verse.

Neoplatonism

The clearest exposition of Platonism in Spenser's writing is *The Fowre Hymnes* (1596), said in the dedication to have been written "in the greener times of my youth." The Hymns are addressed in turn to Love (Cupid), Beauty (Venus), Heavenly Love (Christ), and Beauty (Holy Wisdom). They combine tropes from courtly love, Platonism, and Christianity: the first two hymns are broadly Platonic, while the second two renounce a concern with earthly beauty and embrace Christian *agape* and orthodox doctrines of the Redemption in their evocation of Divine perfection (Dambe 2009).

The chief Platonic ideas at work in the hymns can be seen in the second, "An Hymne in Honour of Beauty." The poet is inspired by Love to praise Love's Mother, Beauty, in order to lift men's gaze to the "heavenly light." Beauty is what makes things seem fair to the eye; it starts as a "goodly Patern," or Platonic form, hidden from earthly view. Earthly things partake in Beauty, which refines the dross of matter, and "quickneth" it with its celestial force. This imparts grace to bodies and is the cause of "amorous desire." Beauty cannot be a matter of externals such as color or proportion, since objects like flowers or paintings do not stir this same desire, and all visible beauties fade. The cause of love is thus eternal and unearthly. A description of the lifting of the lover's gaze from material to intellectual beauty leads to an account of the soul, carrier of the divine spark. The fairest souls choose the fairest bodies ("for of the soul the bodie forme doth take," 132), though a noble mind can be imprisoned in an ugly body, and bodies can tempt admirers to sin. Like seeks out like, and couples are ordained in Heaven. True love starts with an admiration of the body, but the material image is refined into an intellectual one ("A more refyned forme," 214), by which the lover's contemplation is moved to a higher dimension. Thus Spenser embraces the Platonic doctrines of the Forms, the material and intelligible worlds, the

scale of Love, and the pre-existence of the soul. The Neoplatonic doctrine of the three worlds, in which the heavenly spheres are intermediate between the Platonic Material and Intelligible worlds, is referred to in "Hymne of Heavenly Beauty" (see Kaske 2000). Scholars have identified further instances of Platonic ideas in other poems, including passages in *The Faerie Queene* (Kaske 2000), the *Mutabilitie Cantos*, and the *Amoretti* (Quitslund 2016; Bulger 1994; Borris et al. 2009; Quitslund 1973).

Spenser's source material for Neoplatonism has been extensively studied. Early studies emphasized his familiarity with Florentine writings, and convincing parallels have been drawn with Ficino's commentary on Plato's *Symposium*, and its epitome in Benvieni's *Canzona dello Amor Celeste e Divino*, with its own accompanying *Comento* by Pico della Mirandola (see Bennett 1931). Ellrodt (1960) is sceptical of Spenser's alleged direct links with the Florentine school and asserts the poet's adherence to a Christian and native tradition: he is a Platonizing Christian, not a Christianizing Neoplatonist. However, by the late sixteenth century, the ideas propounded by various Platonists and their textual paths of transmission were so multifarious that to assign an Italian and English school of Platonic thought is problematic and tracing exact sources for ideas is often impossible. Later scholarship avoids assigning Spenser to any particular school or program. Spenser's significance to the Platonic tradition is an example of how that philosophy works on a brilliant poetic imagination (Baldwin and Hutton 1994).

Sphrantzes, George

Born: 1401, Constantinople?

Died: c. 1477, Corfu

Christina Kakkoura

University of London, Royal Holloway and
Bedford New College, Surrey, UK

Abstract

George Sphrantzes (1401 Constantinople? to c. 1477 Corfu) was a courtier, a diplomat, and a minister in the service of the last three emperors of the Byzantine Empire. He is mostly known as a historian and the author of the *Chronicon Minus*, a chronicle recording autobiographical information and the authors' personal experiences, concerned also with the

historical, diplomatic, and political events of the last years (1401–1477) of the late Palaeologan period (1260–1453). Alongside his contemporaries Laonikos Chalkokondyles, Ducas, and Michael Critovoulos, Sphrantzes belongs to the group of the "Historians of the Fall", being the only one of the aforementioned who has eye-witnessed the events of the Fall of Constantinople (1453).

Biography

George Sphrantzes' name, cited also as Phrantzes, has been the subject of intensive scholarly debate (Laurent 1951a, b; Tsaras 1977; Philippides and Hanak 2011: 139–143). It is generally accepted that Sphrantzes is the appropriate form of his surname. The variant Phialitēs given to Sphrantzes is possibly due to scribal additions extant in two manuscripts (Mount Athos, Iveron Monastery, 382 and 388) that contain short chronicles (Lambros 1932: 17, 54; Zakythinos 1953; Tsaras 1977). Most of the details concerning Sphrantzes' life derive from his own work, since hardly any other information aside from his name can be found on the author in contemporary sources (Laurent 1951a; Philippides and Hanak 2011: 141–142). If we are to consider as truthful the information he provides in his work, we are able to reconstruct his detailed biography. Sphrantzes provides his exact birth date (30 August 1401), yet he does not specify his birthplace. Though the possibility that he was born on the Greek island of Lemnos, from which his paternal family originated, cannot be ruled out, George was most probably born in Constantinople. This can be deduced by Sphrantzes' recorded friendship with Emperor Constantine XI (1448–1453) from a young age, as well as from the fact that he was baptized by the revered and holy Thomais, who was a nun in Constantinople (*Chronicon* XVIII 1–8: 46–53). He was the offspring of a distinguished family, whose members served the Palaeologan emperors; one of his brothers was in the service of the Emperor John VIII Palaeologus (1425–1448), while his father and uncle acted as instructors to Manuel II

Palaeologus' (1391–1425) children, hence Sphrantzes' close relation to the Constantine XI.

Sphrantzes served as a state official under the last three Byzantine Emperors, Manuel II, John VIII, and Constantine XI the Palaeologi. After his parents' death due to an epidemic, George entered the imperial service (1418) and was appointed by Emperor Manuel II Palaeologus in charge of his chamber (*kelliōtes*), a position that allowed him proximity to the Emperor and the imperial family. In 1423, acting as trustee of Manuel's wife, Empress Helena Dragas, Sphrantzes participated in a diplomatic mission to Sultan Murad II. After Manuel's death in 1425, Sphrantzes came under the orders of Manuel's son and heir John VIII, whom he served for a few years. By 1427, when Constantine XI became Despot of the Morea, Sphrantzes preferred to follow his childhood intimate, whom he served with love and devotion for several years, participating in diplomatic and military missions. As Sphrantzes states, he was the one who rescued Constantine from death in a battle with the Ottomans and himself was held captive (*Chronicon* XVII 1–10: 40–47). Hence, Constantine awarded him for his services the position of the governor (*kephalē*) of Patras in 1430, while in 1432, Emperor John VIII appointed him ambassador and furnished him with the title of the first lord of the imperial wardrobe (*protovestiaritēs*).

In 1438, Sphrantzes married Eleni, daughter of Alexius Palaeologus Zamblacone who was an imperial secretary (*epi tou kanikleiou*), with whom he had five children. George offers in his work information on his children, who all passed away before him.

In 1440, Sphrantzes is found in Lesbos arranging the marriage of Constantine XI with Caterina Cattilusio, while in 1443, he was appointed governor of Selymbria and in 1446 governor of Mystra. Following Constantine XI's accession to the throne in 1448, Sphrantzes resided for a short time in Constantinople, before leaving for a journey that lasted 2 years (1449–1451) to Tribesond and Georgia, in an effort to secure a second wife for his Emperor. The ambassadorial journey was followed by another that led Sphrantzes to the Peloponnese and then to Cyprus. In 1452, George

was rewarded for his services and secretly received by the Emperor the title of the grand chancellor (*megas logothetēs*) (*Chronicon* XXXIV 1–11: 124–130), yet his promising career came to an end due to the events of the Fall of Constantinople (29 May 1453).

During the siege of Constantinople, George and his family were incarcerated by the Ottomans. His children Ioannis and Tamar suffered death after their enslavement by the Ottomans, Ioannis being executed under the suspicion of conspiracy against the Sultan Mehmed II, and Tamar's life coming to an end due to an epidemic while she was imprisoned in the Sultan's harem.

Finding refuge in Mystras, after buying his own freedom, Sphrantzes entered the service of yet another Palaeologus, Thomas, Manuel's youngest son, whom he represented in ambassadorial missions to Serbia (1454) and to Venice (1455–1456), managing in the meantime (1454–1455) to liberate his wife, who was held captive in Adrianople (Edirne). On his return, he left the Peloponnese (1460) to go first to Modone (1458) and later (1460/61) to Corfu. Although he refused to be placed "in charge of the household" of Thomas' wife in Corfu (*Chronicon* XLI 6: 168; Philippides 1980: 84), he accepted to offer his services to the despot for the last time and in 1466 George was sent on a journey to Italy in search for aid. After his return to Corfu, George adopted in 1468 the monastic garb under the name Gregorius. Becoming seriously ill in 1476, he died sometime in 1477.

Heritage and Rupture with the Tradition

Sphrantzes' single known work, the *Chronicon Minus* (*Chronicon* or *Chronicon Syntomon*), forms a unique case among the works of Byzantine literature, namely due to the extent of autobiographical information provided in the work. In the *Chronicon*, a work covering the years 1401–1477, Sphrantzes presents in chronological order, events of political, historical, and public life, in the majority of which he actively participated, while recording his own experiences and providing details of episodes of his personal life.

As himself states at the beginning of his work, “I...George Sphrantzes the pitiful ... wrote the following account of the events that occurred during my wretched life” (*Chronicon* prologue: 4–5; Philippides 1980: 21).

Although Sphrantzes’ work is referred to as a chronicle or memoir, its structure and content do not allow its listing in a definite literary genre, but rather point to the direction that the *Chronicon Minus* was actually an elaboration of the authors’ personal notes and diary. It appears that the composition forms an amalgamation of elements from historiography, memoirs, autobiographies and chronicles (Maisano 1990: 35*–36*). The sources used by Sphrantzes have been identified, being Byzantine short chronicles and annals of the court for the recording of public events, his personal diaries and notes for the writing of events of his life and actions, and oral sources for events he had not witnessed himself (Maisano 1990: 23*–27*).

The information of the *Chronicon* is structured in chronological order in a manner similar to diaries and histories. However, unlike other historiographers, Sphrantzes provides neither an introduction to his work nor does he divide his work into books or chapters, but rather confines himself to a short prologue declaring his name and aim, and proceeds with a brief reference to events of the years 1401–1413, which as he admits did not know with precision for he was very young (*Chronicon* III: 8–9). Then he continues in the main body with the narration of the events of the years 1414–1477 (Philippides 1980: 6–7). At times, the author interrupts the narrative and refers to past events in order to introduce his own views and speak of matters he considers of importance or fitting to the case (cf. *Chronicon* XVIII 1–8: 46–53, XXIII 5–12: 82–87 XXXIV 1–12: 124–131). The insertion of laments observed in the work is customary in chronicles (Hunger 1978: 496). His narrative is in general characterized by the succinct style of diaries. Yet the amount of information he gives in each case varies. In instances, he provides scrutinizing details of affairs of the Palaeologi dynasty and especially of those he was personally involved in, while omitting important events

occurring elsewhere in the Empire. Aside from that, it becomes also evident that Sphrantzes’ judgment is affected by his relations with members of the imperial family and his familiarity with clergymen and laymen of his times, while his feelings of aversion are clearly distinguished. Sphrantzes appears in his description greatly affected by personal motives; for example, while he criticizes the policies of John VIII, he extols Manuel II and Constantine XI and praises their efforts for the survival of the Byzantine state. Similarly, his feelings towards the Ottomans were influenced by the misfortunes he and his family suffered, yet again he does not portray them in negative light (Philippides 1980: 12; Maisano 2003: 131–141; Smarnakis 2015: 228). Remarkable is the fact that though an eyewitness of the Fall of Constantinople (29 May 1453) his description of the actual event is limited to a few brief chapters (*Chronicon* XXXV 6–9: 132–135), nevertheless he provides several explicit details, which make his report rather valuable. Thus, it appears that the chief criterion for the narrative was the participation of the author in the affairs described.

These observations, together with the fact that Sphrantzes does not proceed to a critical assessment of the historical events, set him apart from his contemporary historians. Sphrantzes is of course concerned with the customary for the period matters, that is, the survival of the Byzantine state and the siege of Constantinople, the union of the Churches and the relation between Byzantines and Ottomans. However, his notion of historical causation, his perception of God and his interpretation of events, mark in some instances a rupture with the Byzantine tradition. Following the traditional lines, Sphrantzes refers at times to the Scriptures to interpret events and believes in the providence of God, while considering tragic occurrences as God’s retribution. Nevertheless, it has been argued that Sphrantzes’ representation merely as a religious Byzantine Christian (Smarnakis 2015: 230–231) is superficial and does not reflect the author’s philosophy, which was largely “dominated by political motives” (Turner 1964: 353–354), contrary to other contemporary historians, notably Doukas and

Chalkokondyles. For Sphrantzes, “the single most important cause” that led to the Ottoman conquest of Constantinople (*Chronicon* XXIII 4: 80–81; Philippides 1980: 50) was the Council of Florence, because of its political consequences and not for dogmatic reasons, while the failure of the “Christians abroad” (cf. *Chronicon* XXXVI 1: 136–137; Philippides 1980: 71) to provide military and financial aid to the Byzantine Empire, formed a subsidiary reason that led to the Fall. The absence in Sphrantzes’ work of the optimism for the revival of the Byzantine state, an idea accentuated by Doukas and Chalkokondyles, can be attributed to his pragmatic perception of events and political experiences.

Innovative and Original Aspects

The language of the *Chronicon* forms an interesting case. It has been suggested that Sphrantzes’ linguistic style was shaped by the autobiographical character of his composition, consisting of a mixture of the literary Byzantine language with the vernacular, while direct speech is composed in the spoken language. At the same time, Sphrantzes introduces a number of Italian and Ottoman words (Hunger 1978: 498; Kechagioglou 2001: 63). These elements add to the text’s vividness and it is for these reasons that the *Chronicon* could be considered an early specimen of Greek prose. The narrative is not written in a style similar to that of the majority of Byzantine authors who sought to imitate ancient historiographers, the account is straightforward and personal, and as such innovative.

The *Chronicon* is also an important source for the social history of fifteenth-century Byzantium and yields privileged insights into the circumstances of a member of the imperial court of the late Byzantine period. Sphrantzes was acquainted with prominent clerics and government officials (*archontes*), whom he presents or names in his work. He also provides significant information on court titles, a great number of which he claims to have possessed, royal garments, and imperial customs and decorum.

Impact and Legacy

Though neither of high style nor subjected to literary rules, the *Chronicon Minus* is a text of high historical value, which was elaborated in a later period, in a work known as the *Chronicon Maius* that covers the years 1258–1478. The *Maius*, wrongly attributed in the past to George Sphrantzes (Papadopoulos 1935a, b: 177–189), is actually a work compiled in the sixteenth century by Makarios Melissourgos-Melissenos, bishop of Monemvasia, best known as Pseudo-Sphrantzes. The *Maius* incorporates the *Minus*, elaborating the text with additions from other works, such as the narratives of Laonikos Chalkokondyles, Manuel Malaxos, Damaskenos the Stoudite, and the chronicle of Dorotheos of Monemvasia. It relies on Latin texts, such as Leonard de Langasco of Chios and Pope Nicholas V, as well as earlier Byzantine sources, for example, Theophanes Continuans, Nicetas Choniates, and George Acropolites (Hunger 1978: 496; Philippides 1981; Philippides and Hanak 2011). Until 1935, it was believed that the *Minus* was a compilation of Sphrantzes’ notes or an epitome of the *Maius*, hence for centuries it was Pseudo-Sphrantzes’ work that was in use (cf. Philippides 1981: 287–300, Philippides and Hank 2011). The *Chronicon Maius* “occupies a special position in the annals of Ottoman historiography as it provides a sixteenth-century bridge to the end of Byzantine historiography” while “the immense popularity of the *Chronicon Maius* in the Ottoman centuries attests to the high literary quality of the narrative” (Philippides 2008).

Spina, Bartolomeo

Born: 1576 (or 1477), Pisa, Italy

Died: 1546 (or 1547), Rome, Italy

Tommaso De Robertis

University of Pennsylvania, Philadelphia, PA, USA

Abstract

Bartolomeo Spina was one of the leading theologians of the sixteenth century. As a Dominican friar who followed in the footsteps of Thomas Aquinas, Spina strongly opposed Pietro Pomponazzi's views on the mortality of the soul, claiming that the immortality of the human soul can be demonstrated on the basis of Aristotle's texts themselves. Spina is also remembered for his participation in inquisitorial activities in Italy during the 1520s. He authored a number of works on witchcraft, where he upheld the authenticity of witchcraft and its maleficence.

Biography

Bartolomeo Spina was born in Pisa in 1476 (or 1477). At the age of 18, he entered the Dominican Order in the Convent of Santa Caterina in Pisa. After the customary 7-year course of studies in the Arts and Philosophy, Spina was ordained as a priest and went on to register as a student of theology in the Dominican *Studium generale* of

Bologna (1502). In 1512, the Master of the Order of Preachers, Thomas Cajetan (Thomas de Vio), appointed Spina as *Magister Studiorum* at the Convent of Sant'Eustorgio in Milan, and at the *Studium generale* of Bologna the following year. In 1514, Spina was appointed lecturer at the Convent of San Domenico di Castello in Venice. From 1518 to 1520, he served as inquisitorial vicar to Antonio Beccari da Ferrara, inquisitor of Modena and Ferrara (Tavuzzi 2007). It is in these years that Spina got involved in the debate surrounding the publication of Pietro Pomponazzi's *De immortalitate animae* (1516). Not only did Spina reject Pomponazzi's mortalist arguments completely, but he also took a stand against Thomas Cajetan himself, whom he charged for claiming that Aristotle had never understood the soul to be immortal in his writings. In the fall of 1519, Spina's works were banned in Bologna, a restriction that however was removed in 1526, following a general shift in the doctrinal orientation of the Dominicans of Italy. From this time, Spina's career in the Order started to take off. In 1530, he was appointed *Regens* of the *Studium generale* in Bologna; in 1531, he was elected vicar general of the Order; from 1536 to 1545, he held the chair of Theology in via S. Thomae at the University of Padua; in 1545, he was appointed Master of the Sacred Palace by Pope Paul III and also served in a number of committees at the Council of Trent (during this period, Spina authored a number of theological writings: Spina 1530, 1531, 1533a, b). He died in Rome between 1546 and 1547 (Bertolotti 2018).

Spina's most notable contribution to Renaissance philosophical discussions involves his participation in the lively debate following the publication of Pomponazzi's *De immortalitate animae*. In 1518, Spina penned three works explicitly aimed at confuting Pomponazzi's reading of Aristotle: the *Propugnaculum Aristotelis de immortalitate animae contra Thomam Caietanum*, the *Tutela veritatis de immortalitate animae contra Pomponatium Mantuanum*, and the *Flagellum in tres libros Apologiae eiusdem Peretti*. These writings, along with a brief *Quaestio de ordine sacro*, would be printed together in Venice by Gregorio de Gregori in 1519 under the title of *Opuscula* (published

again in 1535 by Stefano Nicolini da Sabbio). While Spina's *Tutela* and *Flagellum* offered a thorough refutation of the arguments Pomponazzi had presented, respectively, in his *De immortalitate* and in the *Apologia* (1518), a refutation that owes to a great extent to Aquinas' reading of Aristotle, his *Propugnaculum* made a direct attack on Thomas Cajetan himself. In his commentaries on Aristotle's *De anima* (Florence 1509, Venice 1514), Cajetan had posited that while the immortality of the soul may well be demonstrated on philosophical grounds, it is not possible for it to be proven based on Aristotle's works. Spina harshly objected to Cajetan's claim by endorsing Aquinas' view that Aristotle has indeed deemed the human soul immortal. For Spina, Cajetan's position was a serious threat to the primacy of theology over rational thought, and accordingly he should be held responsible for introducing the notion that the soul is mortal to the Christian community (Bertolotti 2018).

Similar doctrinal and political concerns characterize Spina's experience in the Inquisition. Between 1523 and 1525, he published three different works on witchcraft: his very influential *Quaestio de strigibus*, the *Tractatus de praeminentia sacrae theologiae super alias omnes scientias*, and the *Quadruplici apologia de lamiis contra Ponzinibium* (published together in Spina 1576). The aim of these writings was twofold. On the one hand, Spina upheld the reality of witchcraft and of the many misdeeds performed by witches, especially during their flights by night. In doing so, Spina was openly rebutting the claims of the Italian jurist Giovanni Francesco Ponzinibio, who denied in his *De lamiis et excellentia iuris utriusque* (1511) the reality of the acts with which the witches were charged. On the other hand, Spina aimed at affirming that theologians, and not jurists, were equipped to deal with inquisitorial matters (Bertolotti 2010).

Spini, Gherardo

Born: Approximately 1528, Bologna

Died: After 1570, Rome

Clara Stella

Department of Philosophy, Classics, History of Art and Ideas, University of Oslo, Oslo, Norway

Abstract

Gherardo Spini was a Medici courtier, secretary to Duke Cosimo I' son Ferdinando, a man

of letters and a member of the *Accademia Fiorentina* and the *Accademia Fiorentina del disegno* from 1567. Born in Bologna approximately in 1528, Spini experimented with poetry and was deeply involved in cultural circles. He was in close contact with men of letters, including Varchi, Domenichi, and Cellini, and noblewomen such as Laura Battiferra degli Ammaniti. Spini is best known for three unfinished and unpublished books, a treatise about ornaments entitled *I tre primi libri sopra l'istituzione intorno agl'ornamenti* which he started in 1568 and dedicated to Duke Cosimo I de' Medici.

Biography

Gherardo Spini, born approximately in 1528 into an aristocratic Florentine family, lived in Bologna, Florence, and Rome (Acidini 1980). Little is known about Spini's personal life. He married Caterina Cambi, the daughter of historian Giovanni Cambi, and had a daughter of his own named Gostanza Spini (Ardicini 1980). His two uncles, Ulisse and Girolamo, were both captains in Cosimo I's army, and it is likely that Spini went with them to France in their effort to support Francis I Valois (Acidini 1980). At age 13, Spini attended Pietro Vettori's classes at the *Studio fiorentino* and, according to Giovanni Della Casa Spini, was Vettori's best student. He also attended Ignazio Danti's classes at the same venue and became close to professor Antonio Maria de' Pazzi from the *Studio romano* (Ważbiński 1987). His sonnets appeared in many lyrical collections, firstly Lodovico Domenichi's *Rime di donne* (*Rime* 1559), and in several others composed in praise or to commemorate the death of famous figures (e.g., Eleonora di Toledo, Benedetto Varchi, and Michelangelo Buonarroti). He was also figured as a protagonist in renaissance dialogues, like Domenichi's dialogue on love (Domenichi 1562). Gherardo Spini was also designated the author of a courtly dialogue on behavior now lost in a prefatory letter to Domenichi's 1565 edition of the *Facetie* (Domenichi 1565). Spini is also known to have been the man behind the censorship and rewriting of Benvenuto

Cellini's *Trattati* that appeared in print in the form of Spini's humanistic reduction in 1568 (Gallucci 2003).

His most important work remains his unfinished treatise on architecture and ornaments, that is, *I primi tre libri sopra l'istituzioni intorno agl'ornamenti*, conserved in manuscript form and published by Acidini in 1980. He entered the *Accademia fiorentina* in 1567 (Waźbiński 1987) and is likely to have become a member of the Florentine *Accademia del disegno* in the same year. His first reflections on architectural theory though can be traced back to his preface to Giovanni Della Casa's *Le rime, le orazioni e il Galateo* published in 1564 (Afribo 2007; Waźbiński 1987). In the preface, he puts forward a universal understanding of architectural theory and history that sees its roots and origin in Palestine rather than Greece (Waźbiński 1987). The points mentioned in the preface would later be developed in the first book of his unpublished treatise.

Even though the composition of Spini's treatise began in 1568, according to De Pazzi's introductory piece, his writing was still very much in progress in 1570 and was still Spini's "principal occupation" (Payne 1999, p. 285). The nonlinear development of the treatise was influenced by different figures who shaped Spini's view of architecture. Among those is Duke Cosimo I's *maestro di cappella*, as well as organist and composer Francesco Corteccia, who inspired Spini to develop a system in which architectural orders are in line with musical proportions (Waźbiński 1987). From 1571, when his protector Ferdinando de' Medici moved from Florence to Rome, Spini thoroughly studied Roman monuments in the city. His interest in archaeology had a profound impact on the writing process of the treatise.

Spini's interpretation of the development of architecture consists of a sequence of cycles that eventually progress to the Tuscan style. In light of the revival of classicism and the literary, as well as artistic, narratives of Cosimo I as the new Solomon and Augustus of Italy, Spini sees the perfect model of architecture in Solomon's temple and criticizes the gothic and mannerist style of his time. In addition to a profound reflection on

antiquity with his reflections on Vitruvius (Payne 1999), Spini's eclectic views on architecture try to connect (not without contradictions) architectural elements to mathematics and music (Waźbiński 1987), figures of speech and rhetoric (Van Eck 2007), as well as the parts of the human body (Payne 1999, 2001). In his attempt to produce a new universal model, with its roots grounded in the classics, he sees style as a symbol and a tool to serve and reflect the unity of power (Waźbiński 1987).

Innovative and Original Aspects

Spini's work claims "an exceptional status" because it combines three genres: "the treatise on ornament, that on license (or prescription), and that on imitation" (Payne 1999, p. 147). Although not new, these concepts have never been associated with architecture. His approach is "unique" due to his direct statement that buildings are divided into "fabrica," which means *necessità*, and "ornamento," and from the ornaments is born "the dignity, and beauty of the edifice" (Payne 1999, p. 148). For the first time, the category of architectural *ornatus* comes explicitly into its own and claims an entire treatise. Nonetheless, Spini's text established an important link between the literary and architectural cultures of its time by creating space for a deep consideration of the notion of *licentia* in response to Michelangelo's work.

seventeenth century and deeply influenced its further development. Drawing on different traditions of thought, he created a system of philosophy that challenged the views of his contemporary readers in almost every domain. From his metaphysics to his epistemology, from his account of morals to his political theory, from his method of interpreting Scripture to the method of exposition that he employed in his main work – namely, the *Ethics Demonstrated in Geometrical Order* (1677) – there is not a single aspect of Spinoza's philosophy which has not been thoroughly examined and discussed. Yet, Spinoza's theses and arguments continue to influence philosophical debates. Spinoza's substance monism, his identification of God with nature, his strict necessitarianism, his unique account of the mind–body relationship and of human affects, and his passionate defense of religious freedom and freedom of thought are still a source of inspiration for many thinkers and the focus of several studies, not necessarily related to the limited domain of the history of philosophy.

Abstract

Spinoza's philosophy radically changed the framework of Western thought in the

Biography

Baruch Spinoza was born on November 24, 1632 in Amsterdam, from a Jewish family, which emigrated from Vidigueira, in Portugal, to the more tolerant Dutch Republic. His father, Michael, ran a mercantile activity in Amsterdam. In 1639, Baruch commenced school at the local Sephardi Jewish community, recently reunited under the guidance of a unique congregation, called *Talmud Torah*, where he distinguished himself as an excellent student. Ten years later, in 1649, after the death of his elder brother Isaac, Baruch was directly involved in the management of his father's firm, and by 1652 he had left the rabbinic school. He then attended a school

of classical Latin studies, recently opened in Amsterdam by Franciscus van den Enden, an erudite former Jesuit, doctor, and philosopher with a humanist background and radical political views, who would later be hanged in Paris, on November 27, 1674, after having conspired against the king of France Louis XIV. It is likely during this period that Spinoza first approached the texts of Machiavelli, Bacon, Hobbes, and, most importantly, Descartes (Nadler 1999, 111). On March 28, 1654 Michael Spinoza died, leaving behind a considerable amount of debts. In March 1656, before having reached the legal age, Baruch requested to be put under legal custody as a minor and orphan (Baruch's mother, Hanna Debora, had already died in 1638), and, on March 23, his estate was separated from his father's bankrupt one. More or less at the same time, the *Mahamad* of the Amsterdam Portuguese-Jewish congregation started to examine Baruch's case to proceed with his expulsion from the Jewish community, which eventually occurred on July 27 of the same year – the formal reasons for this ban, or excommunication (*herem*, in Hebrew), being apparently due to Spinoza's "evil opinion and acts," "abominable heresies which he practiced and taught," and "monstrous deeds" (Nadler 1999, 120). Yet, the actual motives that may have led to such an upshot are still much debated by historians (Nadler 1999, 116–154; Israel 2001, 166–173; Popkin 2004, 27–38).

Little is known about Spinoza's life during the first few years after his excommunication. First he started to write a treatise concerning the goals and the right method of philosophizing, entitled *Tractatus de intellectus emendatione* (*Treatise on the Emendation of the Intellect*), a text that he left unfinished and that was later included in his *Opera Posthuma*. He then compiled the *Korte verhandeling van God, de mensch, en deszelfs welstand* (*Short Treatise on God, Man, and His Well-Being*), the first complete writing where Spinoza's main theses are exposed in a systematic and discursive way. It remained unpublished and relatively unknown until the discovery of two non-autographed Dutch manuscripts (probably translations of a lost original) in the second half of the nineteenth century. In the

meantime, Spinoza ceased his father's commercial activity and began a profession of his own as a lens polisher – a job that he kept doing until his death and that earned him a certain reputation. In 1661, he moved to Rijnsburg, near Leiden. During the summer of 1661 Spinoza met with Henry Oldenburg, Secretary of the *Royal Society of London*, with whom he started a long and fruitful exchange of letters, and through whom he was able to read and express his opinions on Robert Boyle's *Certain Physiological Essays* (1661). In 1663, under request of his friends, Spinoza consented to publish a manual on Cartesian philosophy that he was currently dictating to a student of his. The result consisted of a volume containing two separate texts, respectively entitled *Renati Des Cartes Principiorum Philosophiæ* (*Descartes' Principles of Philosophy*) and *Cogitata Metaphysica* (*Metaphysical Thoughts*), where Spinoza first exposes parts of Descartes' *Principles of Philosophy* in geometric order and then discusses some traditional topics according to a Cartesian perspective. It remained the only book that Spinoza published under his name during his lifetime. In the same year, Spinoza moved to Voorburg, near The Hague, where he remained for less than ten years. There he had the opportunity to acquaint himself with Christiaan Huygens, who admired Spinoza's skills as a lens grinder. During these years Spinoza focused on developing his two masterpieces: the *Tractatus theologico-politicus* (*Theological-Political Treatise*) and the *Ethica Ordine Geometrico demonstrata* (*Ethics demonstrated in Geometric Order*).

Spinoza eventually moved to The Hague between the end of 1696 and 1671. In 1670, in Amsterdam, the *Tractatus theologico-politicus* was published anonymously, bearing neither the author's name, nor the name of the publisher or the city of publication. Despite these precautions, the authorship of the text was soon attributed to Spinoza and its content provoked a great deal of controversy and scandal all over Europe. Spinoza's theories concerning the right method of interpreting Scripture, the identity of God and nature, and his denial of the existence of miracles seemed unacceptable to the great majority of

contemporary readers, prompting the redaction of numerous confutations throughout the following years. In 1671, Spinoza had to intervene in person, to halt the publication of a Dutch translation of the *Treatise*, fearing a possible condemnation of the text in the Dutch Republic. In February 1673, on behalf of the Elector of Palatine, Spinoza was offered a chair in philosophy at the University of Heidelberg, provided he did not abuse his freedom of philosophizing to perturb the publicly established religion; one month later, Spinoza politely refused the offer, justifying himself by claiming that he did not know within which limits his freedom of philosophizing had to be constrained in order not to disturb the local religious customs and rules. On July 19, 1674 the *Theological-Political Treatise* was eventually condemned by the Dutch Courts, along with Thomas Hobbes' *Leviathan* (whose Dutch and Latin translations were respectively published in 1667 and 1668) and a treatise concerning the right method of interpreting Scripture written by Spinoza's friend Lodewijk Meyer, entitled *Philosophia Sacrae Scripturae interpres* (1666). The following year, Spinoza went on a trip to Amsterdam to arrange the publication of his *Ethics*; however, Spinoza states in his correspondence that rumors and slanders regarding the allegedly atheist nature of this text spread out even before it went to press, so that he eventually decided not to publish it. In the last few years of his life, he started to write the *Tractatus politicus* (*Political Treatise*), which remained unfinished.

On February 21, 1677, in his rented room at The Hague, Baruch Spinoza died of respiratory problems, resulting perhaps from a form of tuberculosis, as reported by several sources, possibly aggravated by the massive amount of glass powder inhaled while grinding lenses (Nadler 1999, 349–350; van Bunge et al. 2011, 36–37). He left his manuscripts to his friends, who took care to publish them in the same year in a comprehensive Latin edition – the *Opera Posthuma* (Spinoza 1677a) – which includes the *Ethica*, the unfinished *Tractatus Politicus* and *Tractatus de intellectus emendatione*, part of Spinoza's correspondence, and an unfinished *Compendium Grammatices Linguae Hebraeae* (*Compendium on*

Hebrew Grammar). A Dutch translation (the *Nagelate Schriften*) quickly followed (Spinoza 1677b). Both the Latin and the Dutch editions were published anonymously, except for the letters “B. d. S.” imprinted on the frontispieces, denoting the author.

Heritage and Rupture with the Tradition

Although Spinoza systematically avoids appealing to authority in his texts – with external sources and authors being rarely mentioned – his terminology includes concepts and categories drawn from both the theological and scholastic traditions, on the one hand, and from the “new science” and the Cartesian philosophical language, on the other hand. However, Spinoza often provides those same traditional notions with new meanings, more coherent with his overall philosophical understanding. Considering, moreover, the scarcity of information in our possession concerning Spinoza's life, it follows that it is arduous, if not impossible, to precisely identify all the sources to which Spinoza had direct or indirect access and assess how they variously contributed to the development of Spinoza's thought.

The Jewish philosophical and theological tradition of thought unquestionably played an important role in Spinoza's formation, beginning with his teacher at the Talmudic school, Menasseh ben Israel (1604–1657). The influence of Moses Maimonides (1138–1204) and Hasdai Crescas (ca. 1340–ca. 1410) on Spinoza's thought is undeniable too and attested by direct references and quotations. Spinoza makes no explicit mention, however, of Jewish neo-Platonic philosopher Judah Abrabanel (also known as Leone Ebreo, ca. 1465–after 1521), even though he owned a copy of his famous work *Dialoghi di amore* (*Dialogues of Love*, 1535). Another possible Jewish source worth mentioning is Joseph Solomon Delmedigo (1591–1655), who was a student of Galileo Galilei in Padua and a friend of Spinoza's teacher Menasseh ben Israel (van Bunge et al. 2011, 74–82). Besides this, Spinoza was also well trained in classical literature and was acquainted with the major ancient

philosophical currents. He directly read Aristotle's writings, as he owned an edition of Aristotle's complete works (Manzini 2009). His philosophy often seems to echo Stoic themes and, as a matter of fact, Spinoza owned several writings of Stoic thinkers, such as Epictetus and Seneca. Like the Stoics, Spinoza conceives of a unique universe thoroughly governed by a necessary network of causal connections, and he identifies the best life in that of an individual capable of becoming aware of the causal network and of acting in accordance with it. Unlike the Stoics, however, Spinoza firmly rejects any finalism in nature (van Bunge et al. 2011, 82–84; Miller 2015).

Spinoza only mentions Francis Bacon (1561–1626) a few times in his letters, but he possessed some of his writings. To which extent Spinoza was influenced by Bacon's natural philosophy is uncertain and still understudied. Spinoza also read Thomas Hobbes (1588–1679), whose reflections on politics, anthropology, physics, and method certainly were of some inspiration to Spinoza. Huge differences separate their respective philosophies, though, the most notable of which rests in Spinoza's preference for a democratic political system, regarded as the best and most rational form of civil organization. Moreover, Spinoza studied Niccolò Machiavelli (1469–1527) and held him in high regard, but the actual ways in which Machiavelli's analyses may have affected Spinoza's political thought are not sufficiently clear. Spinoza's innovative reading of Scripture as a secular text certainly drew some inspiration from Ibn Ezra's (ca. 1092–ca. 1167) biblical commentaries, as well as from the arguments put forth by Isaac La Peyrère (1594–1676) in his *Præ-Adamitæ* (1655), which Spinoza had in his library. The real impact that the political ideas of Franciscus van den Enden (1602–1674) may have had on his pupil Spinoza is still debated by historians (Nadler 1999, 107–114; Israel 2001, 168–171; van Bunge et al. 2011, 68–71). In addition to this, it has been proven that Spinoza was familiar with the thought of neo-scholastics, such as Franco Burgersdijk (1590–1635) and Bartholomeus Keckermann (ca. 1572–1609), and with the rising Cartesianism

defended, among the others, by Adriaan Heereboord (1613–1661) and Johannes Clauberg (1622–1665). Conversely, nothing conclusive can be said about Czech physician Johannes Marcus Marci (1595–1667), sometimes regarded as a precursor of some aspects of Spinoza's psychological theory. Spinoza's thought also seems to recall some features of Giordano Bruno's overall system (1548–1600), although there is no evidence that Spinoza ever had any contact with the Italian philosopher's texts or doctrines. In particular, they have been associated because of their pantheist and pananimist view of the universe, conceived of as eternal, infinite, and substantially homogeneous. The philosophy of Arnold Geulincx (1624–1669) and the heretical theses of Uriel da Costa (ca. 1583–1640) are other possible sources, whose influence on Spinoza has yet to be verified (van Bunge et al. 2011, 58–60).

The most important source of Spinoza's intellectual development is Descartes. Spinoza had several editions of Descartes' works in his library, and all of his philosophy – excluding his political and exegetical theories – clearly shows that he thoroughly studied Descartes and pondered over his theories. Spinoza's writing on *Descartes' Principles of Philosophy* testifies to the level of expertise and familiarity he had with Descartes' system. There he infers the main theses of Descartes' metaphysics and physics following the geometric order – a deductive structure consisting of definitions, axioms, and theorems (or propositions). The appendix to the treatise, called *Metaphysical Thoughts*, is a survey of topics in epistemology, metaphysics, and theology, which Spinoza treats and discusses along the lines of Descartes' philosophical principles. In this regard, Lodewijk Meyer's prefatory note to the text advises us about Spinoza's actual position, while he was acting as a Cartesian teacher and expositor: "Though he judges that some of the doctrines are true, and admits that he has added some of his own, nevertheless there are many that he rejects as false, and concerning which he holds a quite different opinion" (Spinoza 1985, 229). Indeed, despite Descartes' enormous contribution, Spinoza's philosophy cannot be reduced to a form of Cartesianism.

In his most representative work, the *Ethics*, Spinoza makes use of a Cartesian conceptual framework to overturn Descartes' main conclusions concerning metaphysics and epistemology. Extension and thought, which Descartes conceived of as separate substances, are regarded by Spinoza as different attributes of a unique substance, God. God is understood by Spinoza as the immanent cause of the existence of each thing – whereas, for Descartes, God is the external or transitive cause of the existence of both the extended and the thinking substances – and is finally identified by Spinoza with the infinite whole of nature. Spinoza rejects the Cartesian distinction between intellect and will and staunchly denies the existence of any free will. As a consequence, Descartes' theory of error, which is based on that distinction and on the existence of a faculty of free will, is completely abandoned by Spinoza. Spinoza's theory of error is grounded on the passivity and partiality of the human mind, conceived of as a finite part of God's infinite intellect: "if it is—as it seems at first—of the nature of a thinking being to form true, or adequate, thoughts, it is certain that inadequate ideas arise in us only from the fact that we are a part of a thinking being, of which some thoughts wholly constitute our mind, while others do so only in part" (Spinoza 1985, 33). Spinoza seems to agree with the basic tenets of Descartes' physics, although differences can be envisaged between the two – notably, with regard to the peculiar treatment Spinoza makes of the concept of *conatus*, which he broadly conceives of as the striving of a thing to preserve in its being and which is one and the same as the essence of the thing itself. Spinoza explicitly criticizes Descartes' doctrine of mind–body interaction. He claims that no causal interaction can ever occur between modes of extension and modes of thought and rejects Descartes' theory of a mediation of substances through the movements of the pineal gland as a "hypothesis more occult than any occult quality" (Spinoza 1985, 596). Finally, it is also worth noting that Descartes, at the end of his *Replies to the Second Set of Objections to the Meditations*, already delivered an example of deduction of the first principles of his metaphysics (namely, the existence of God

and the distinction between the soul and the body) in geometric order. However, the massive employment that Spinoza makes of the geometric order of demonstration in his writings – used to cover topics in the metaphysical and epistemological domains as well as in the domain of morals and in the analysis of human affects – simply has no equal in the history of philosophy.

Innovative and Original Aspects

In his unfinished *Treatise on the Emendation of the Intellect*, Spinoza states the reasons that led him to devote his life to philosophy: "I resolved at last to try to find out whether there was anything which would be the true good, capable of communicating itself, and which alone would affect the mind, all others being rejected—whether there was something which, once found and acquired, would continuously give me the greatest joy, to eternity" (Spinoza 1985, 7). The eminently ethical goal of Spinoza's speculations, consisting in the attainment of the highest human good, both individually and socially, characterizes the whole of Spinoza's philosophical production. Spinoza identifies our highest good in knowing God, and in the intuitive knowledge that we may have of things as they are eternally comprehended in God. This knowledge, Spinoza writes in the Fifth Part of his *Ethics*, causes the greatest satisfaction of the mind and an eternal, intellectual love towards God. In the political domain, Spinoza identifies the best civil order as a state that grants all its members the best means to achieve their good: thus, he argues that the best state is that which best grants its citizens mutual safety and full freedom to philosophize.

The metaphysical core of Spinoza's philosophy rests in the use that he makes of the concept of substance. Spinoza demonstrates that there is only one substance, infinite, uncreated, and eternal. This substance is God, which, in the First Part of the *Ethics*, Spinoza defines as "a being absolutely infinite, i.e., a substance consisting of an infinity of attributes, of which each one expresses an eternal and infinite essence" (Spinoza 1985, 409). It follows that

any thing in nature must be regarded as a modification of a unique substance, that is, God, conceived under one of its infinite attributes. As Spinoza puts it, “whatever is, is in God, and nothing can be or be conceived without God” (Spinoza 1985, 420). Thought and extension are counted by Spinoza among the infinite attributes of God. All corporeal things are therefore modifications of God expressed under its attribute of extension. Similarly, any spiritual thing, or any mental act in general (all of which are commonly called by Spinoza by the same term, *idea*), is to be understood as a modification of God’s attribute of thought. Since God is infinitely powerful and capable of infinitely many modifications in each of its attributes, Spinoza claims that “from the necessity of the divine nature there must follow infinitely many things in infinitely many modes” (Spinoza 1985, 424). God is therefore the cause of itself, immanent cause of all existing things, and efficient cause of the existence of an infinity of things in nature. As Spinoza writes in the *Theological-Political Treatise*, the universal laws of nature, according to which everything is determined to exist and to act in a necessary way, “are nothing but decrees of God, which follow from the necessity and perfection of the divine nature” (Spinoza 2016, 154). Spinoza denies the existence of final causes operating in nature – a thesis that he rejects as fictional. Rather, each of God’s modifications is necessarily determined to exist and to act in a certain way by another modification of the same attribute, which in turn has been caused to exist by another, and so on, to infinity. This entails the existence of an infinite and eternal causal network connecting each thing in each of God’s attributes. Although, as Spinoza maintains, no causal interaction can ever occur between modes of different attributes – hence, a body cannot modify an idea and, vice versa, an idea cannot modify a body – the order and connection of the ideas in God’s attribute of thought perfectly match the order and connection of things in the other attributes. “Therefore,” Spinoza writes in the Second Part of the *Ethics*, “whether we conceive nature under the attribute of extension, or under the attribute of thought, or under any other attribute, we shall find one and the same order, or one

and the same connection of causes, i.e., that the same things follow one another” (Spinoza 1985, 451).

On this account, also a human body is a finite mode of God’s attribute of extension; accordingly, the corresponding human mind is the idea of that body in God’s attribute of thought – hence, the human mind is a finite part of God’s infinite intellect. Therefore, everything that occurs to a human body, Spinoza argues, must also correspond to an idea in the corresponding mind and must be perceived by it. The fact that an individual is aware of the modifications that affect her body, however, does not imply that she also adequately knows anything. When a human perceives the traces produced in her body by external objects, and regards these traces as if they were the objects themselves, that individual is said to imagine. Moreover, as long as an individual is only conscious of her appetites and actions through the ideas of her affections, and remains ignorant about the causes that necessarily determine her to exist and act in a certain way, that individual is inclined to falsely think of herself as free. Such an individual is instead utterly passive, since in her case the external causes act upon her and determine her, without her being aware of them. The access to reason and adequate knowledge, Spinoza argues, is provided by common notions. Common notions grasp eternal and necessary truths, common to all bodies, or common to the human body and other bodies by which the human body is affected. Above imagination and reason, Spinoza adds a third kind of knowledge, which he regards as the highest and calls “intuitive knowledge” (*scientia intuitiva*, in Latin): “this kind of knowledge,” Spinoza writes, “proceeds from an adequate idea of the formal essence of certain attributes of God to the adequate knowledge of the essence of things” (Spinoza 1985, 478).

In the Third Part of the *Ethics*, Spinoza affirms that he wants to consider human passions, actions, and appetites as natural phenomena, which arise in human beings with the same necessity and according to the same causal laws that rule any event in nature. “I shall consider human actions and appetites,” Spinoza claims, “just as if it were a question of lines, planes, and bodies” (Spinoza

1985, 492). On these grounds, Spinoza founds his geometry of human affects by building on a few principles common to all things. The first and most fundamental principle is that each thing strives to persevere in its being. This striving (*conatus*, in Spinoza's Latin terminology) constitutes the actual essence of the thing. In human beings, it corresponds with their appetite – that is, what is consciously perceived by humans as their “desire,” or is called “will” when referred to their mind alone. From one's appetite, all actions and reactions to external stimuli necessarily follow, aiming for the preservation of the self, according to one's powers and capabilities. Along with her desire, the most basic affects of an individual are joy and sadness. Joy is the affect connected to an increase in an individual's power of thinking and acting. Conversely, sadness is the affect perceived when a decrease in one's power of thinking and acting occurs. When joy or sadness are accompanied by the idea of their external cause, either love or hate towards the external object arise. By her affects of love and hate, a human is necessarily led to seek and take care of anything that might affect her with joy, and to avoid and possibly eliminate everything that might be the cause of her sadness or do her harm. From these few basic affects, all the others follow, even the most complex, allowing Spinoza to explain the whole of human behavior according to natural causal principles. Coherently, Spinoza contends that a thing is called either good or evil only to the extent to which it affects an individual with joy or sadness, that is, insofar as a thing is either useful or harmful to one's self-preservation. The most fundamental norm of reason is, therefore, to look for what is useful for one's self-preservation and joy: “since reason demands nothing contrary to nature,” Spinoza writes in the Fourth Part of the *Ethics*, “it demands that everyone loves himself, seek his own advantage, what is really useful to him, want what will really lead man to a greater perfection, and absolutely, that everyone should strive to preserve his own being as far as he can.” (Spinoza 1985, 555). In this sense, Spinoza says, human virtue is identical to one's power to preserve her being. Hence, virtue is a good to be sought for its own sake and, according

to Spinoza, is essentially linked to one's ability to use her reason and adequately know things. Indeed, Spinoza maintains that “we know nothing to be certainly good or evil, except what really leads to understanding or what can prevent us from understanding” (Spinoza 1985, 559). Since the greatest object of knowledge is God, our highest good and the greatest virtue of our mind rests in our capability of understanding God. This knowledge of God, Spinoza affirms, is the same knowledge that we may have of natural things by intuition, that is, by the third kind of knowledge. In the Fifth Part of the *Ethics*, Spinoza calls “intellectual love towards God” the joy that arises in humans from the highest kind of knowledge. The intellectual love of God, Spinoza argues, is as eternal as its object and is a part of the infinite and eternal love by which God loves himself.

Spinoza identifies right and power. “Whatever each man does according to the laws of his nature,” he writes in his *Political Treatise*, “he does with the supreme right of nature. He has as much right over nature as he has power” (Spinoza 2016, 508). It follows that in a state of nature everyone is allowed everything, except for what is against her appetite, or beyond her reach. The right of nature, therefore, does not prevent conflicts, hatreds, deceits, and everything that a human could be led to by blindly following her desire. Indeed, according to Spinoza, human beings, insofar as they are led by their passions, have different and possibly conflicting natures. When, however, they act according to reason, they necessarily aim to what is useful to the preservation of their common human nature and are most useful to each other. Hence, rational individuals acknowledge the usefulness of living in an organized society and accept the laws of the state, not by fear of being punished, but by free reasoning. A multitude organized around a common rule and “led as if by one mind,” Spinoza writes, has as much right as power. “This right, which is defined by the power of a multitude, is usually called *Sovereignty*. Whoever, by common agreement, has responsibility for public affairs—that is, the rights of making, interpreting, and repealing laws, fortifying cities, and making decisions about war and peace, etc.—has this right

absolutely” (Spinoza 2016, 514). The presence of a common established rule, and of an authority capable of implementing it, gives birth to social moral values, such as those of sin and injustice – which, outside an organized social and political context, would make, thus, no sense. In the *Theological-Political Treatise*, Spinoza defines democracy as “the most natural state, and the one which approached most nearly the freedom nature concedes to everyone” (Spinoza 2016, 289). However, Spinoza’s political analyses concern all kinds of states. Just like any other thing in nature, also a state strives to preserve itself, and shall therefore permit nothing that can harm it or lead to its destruction. Since the end and reason of being of all civil organizations are grounded on their capability of preserving peace and safety for their citizens, a state which harms its citizens is basically acting against its nature and against reason and ceases to be a state. In particular, no state can deny its citizens their right to think without constraints, freely use their reason, and judge anything. “The end of the Republic,” Spinoza concludes, “is not to change men from rational beings into beasts or automata, but to enable their minds and bodies to perform their functions safely, to enable them to use their reason freely, and not to clash with one another in hatred, anger or deception, or deal inequitably with one another. So the end of the Republic is really freedom” (Spinoza 2016, 346).

The freedom to philosophize is also the focus of Spinoza’s considerations about revealed religion and the original meaning of Scripture. Spinoza’s *Theological-Political Treatise* aims explicitly “to separate faith from philosophy” (Spinoza 2016, 264). Spinoza critically examines Scripture, considering the historical context in which it was written, and concludes that its teaching (as well as all teachings of prophetic nature) only concerns the formal conditions of the obedience towards God, in which faith effectively consists. The teachings revealed in the Testaments, Spinoza contends, do not imply any scientific knowledge of the facts of nature. “Who does not see,” Spinoza writes, “that each Testament is nothing but a training in obedience, and that neither

Testament has any other aim than that men should obey from a true heart?” (Spinoza 2016, 264). There is, however, a universally valid law that can be drawn from Scripture, which also agrees with what sound reasoning teaches, and which prescribes us to love our neighbor as ourselves. No true religious faith, therefore, constrains anyone from freely philosophizing, as long as one attends to this tenet alone. “Faith,” Spinoza concludes, “grants everyone the greatest freedom to philosophize, so that without wickedness he can think whatever he wishes about anything” (Spinoza 2016, 271).

Impact and Legacy

Except for a circle of enthusiast friends and admirers, the first reactions to Spinoza’s philosophy were mostly negative. As a matter of fact, the appearance of Spinoza’s writings on the European scene created scandal and concern. Summing up a common opinion of his times, in his *Various Thoughts on the Occasion of a Comet* (1682) Pierre Bayle referred to Spinoza as “the greatest atheist there ever was.” In the long article that Bayle devoted to Spinoza in his *Dictionnaire historique et critique* (1697) – where he defined Spinoza as a “systematic atheist” – he also acknowledged the fact that, by then, “Spinozism” had become a common label, used to address any apparent case of impudent atheism. Yet, the same article also greatly contributed to depicting the enduring image of Spinoza as an example of a “virtuous atheist” – that is, a thinker whose ideas are dangerous for any established religion, but whose behaviors appear nonetheless beyond reproach.

Several expositions, discussions and, above all, refutations of Spinoza’s philosophy were written and began to circulate soon after the publications of his major works, the *Theological-Political Treatise* and the *Opera Posthuma*. To provide a complete list of them is an almost impossible task. Among those who first reacted to Spinoza, Bayle mentions Jean-Baptiste Stoupe, author of *La religion des Hollandois* (1673), and Johannes Bredenburg, who wrote a refutation entitled *Enervatio Tractatus*

theologico-politici (1675). Bredenburg's case is interesting, for it seems that while he was working on his refutation, he was eventually convinced by Spinoza's arguments and became an advocate of Spinozism himself. In a similar way, Henri de Boulainvilliers' attempt at refuting (appeared in 1731) was mainly read as the proof of a conversion to Spinozism, and his writings on Spinozism became seminal for the later diffusion of Spinoza's thought in pre-revolutionary France. One of the first refutations of Spinoza's *Ethics* was written by Henry More. His *Confutatio* was published in 1679, in his *Opera Omnia*, and was translated into Dutch in 1687 by Frans Kuyper. In 1676, Kuyper himself wrote a refutation of Spinoza's *Theological-Political Treatise*. Cartesian philosophers immediately distanced themselves from Spinoza's theses, as they had to defend themselves from intellectuals accusing Cartesianism of being the cradle of Spinozism. For instance, Pierre-Daniel Huet wrote various influential texts between 1679 and 1690, where he attacked with equal strength both Spinozism and Cartesianism. Christoph Wittich, Cartesian philosopher in the Dutch Republic, provided a thorough critical analysis of the *Ethics*, published in 1690 with the unambiguous title *Anti-Spinoza sive Examen Ethices Benedicti de Spinoza*. In 1696, the French Cartesian François Lamy published his own confutation of Spinoza, entitled *Le nouvel atheisme renversé*, which included a French translation of the First Part of Spinoza's *Ethics*. In 1704, Pierre-Sylvain Régis also refuted Spinoza from a Cartesian point of view, in a text entitled *L'Usage de la raison et de la foi*. On the other hand, Samuel Clarke saw the defense of Newtonian philosophy and the rebuttal of Spinoza as connected goals. In *A Demonstration of the Being and Attributes of God* (1705), he attacked Spinoza, addressing him as "the most celebrated patron of atheism in our time." At the same time, he was engaged in a controversy over the nature of motion and matter with John Toland, who, in his *Letters to Serena* (1704), criticized the poverty of Spinoza's arguments concerning physics. Toland did not seem, however, to reject Spinoza's main metaphysical principles. A particularly successful

anti-Spinozist treatise was written in the Dutch language by Bernard Nieuwentijt in 1715. His writing was soon translated into English, with the title *The Religious Philosopher* (1718), as well as into French and German. The Scottish thinker Andrew Michael Ramsay wrote a refutation of Spinozism, published posthumously in 1748 with the title *The Philosophical Principles of Natural and Revealed Religion*, which is likely to have inspired David Hume's own criticism of Spinoza's philosophy (Popkin 2004, 117–118). In *A Treatise of Human Nature* (1739), Hume first accuses Spinoza of atheism and then accuses all those who maintained the doctrine of the immateriality, simplicity, and indivisibility of the thinking substance of being Spinozists – hence, of being atheists. This clearly demonstrates the extent to which the accusation of Spinozism, most of the time used as an equivalent of professing atheism, was to be taken seriously, at least until the second half of the eighteenth century. Among those who had to explicitly defend themselves from such an accusation, we can list, for instance, John Locke and Nicolas Malebranche. Towards the end of the eighteenth century, however, Spinoza's philosophy began to raise a great deal of interest in Germany, giving rise to the philosophical controversies commonly known as *Atheismusstreit* and *Pantheismusstreit*. Spinoza's philosophy was widely debated, and partially rehabilitated, following discussions that involved various authoritative intellectual figures, such as Gotthold E. Lessing, Friedrich H. Jacobi, Moses Mendelssohn, Johann G. Fichte, Friedrich Schelling, and G. W. F. Hegel. Among the most important readers of Spinoza one should also count Gottfried W. Leibniz, who heard about him as a philosopher and a lens polisher before 1670. He had the opportunity to exchange letters with him and met him in 1676. He read Spinoza's *Theological-Political Treatise* and the *Opera Posthuma*, carefully annotating and commenting on Spinoza's texts. Leibniz expressed outrage over Spinoza's theses, but recognized in him an exceptionally acute adversary. The connection between the development of Leibniz's philosophy and his reception of Spinoza is currently at the center of interesting studies (Lærke 2008).

Spirit in Renaissance Medicine

Hiro Hirai

Center for the History of Philosophy and Science,
Radboud University Nijmegen, Nijmegen,
The Netherlands

Abstract

The “spirit” (*pneuma* in Greek and *spiritus* in Latin) was often defined as the corporeal instrument of the “soul” (*psychê* in Greek and *anima* in Latin) for physiological functions in living beings. Since the soul was difficult to grasp in a material dimension, the role of the spirit as a key to understanding the secret of life

gradually increased in the late sixteenth and early seventeenth centuries. A long quest for a material spirit of life was launched.

Synonyms

[Pneuma](#); [Spiritus](#); [Vital balsam](#)

Heritage and Rupture with the Tradition

The notion of spirit was fundamental in the medical teachings of medieval universities. The *spiritus* was believed to reside in the body of living beings as an invisible, extremely tenuous, and vapor-like substance, which is diffused by the blood into the whole body. It was often seen as the soul's primary instrument, being responsible for physiological functions and serving as the medium between the soul and the body (Bono [1984](#)). This traditional notion underwent a profound mutation during the Renaissance.

Innovative and Original Aspects

At the end of the fifteenth century, Italian Platonist Marsilio Ficino (1433–1499) advanced an influential theory of the “World-Spirit” (*spiritus mundi*) in his *On Obtaining Life from the Heavens* (*De vita coelitus comparanda*), the third book of his successful work, *Three Books on Life* (*De vita libri tres*). Ficino posited the World-Spirit as the intermediary between the “World-Soul” (*anima mundi*) and its body (*machina mundi*). His theory was crucial in imposing a cosmological dimension on the traditional notion of *spiritus*. As this universal bond was meant to possess a special tie with the human being, it also contributed to the cosmic status of the human being. Adopted by many of Ficino's followers, the theory provided a fresh stimulus in Renaissance medicine and natural philosophy (Ficino [1489](#); Hirai [2002](#)).

French physician Jean Fernel (1497–1558) tried to elaborate the notion of spirit on the basis of his Platonized interpretation of Galen in his work *On the Hidden Causes of Things* (*De abditis*

rerum causis). He divided the *spiritus* into three kinds: the spirit of God, the spirit of nature, and the spirits of living beings. The spirit of God is that of the Bible, while the spirit of nature is inspired by Ficino's theory of the World-Spirit. For Fernel the inferior spirits of living beings are governed by and tied to the superior spirit of nature, which is in turn directed by the spirit of God. Since the inferior spirits and their innate heat are the causes of life's functions, their extinction provokes the death of living beings. The fundamental tools of Fernel's physiology are established on his particular reading of Aristotle's *Generation of Animals* 2.3, according to which “nature” in the seed's *pneuma* corresponds by analogy to the element of stars (Fernel [1548](#); Hirai [2011](#)).

Italian natural philosopher Bernardino Telesio (1509–1588) acknowledged two principles for all natural things: active cosmic heat and passive coldness. He also replaced the soul of living beings by the spirit as the cause of life's functions. He went even further to regard the spirit as an active material portion, in which cosmic heat is highly condensed. For him the spirit is, so to speak, the material vehicle of cosmic heat (Telesio [1586](#); Hirai [2017](#)).

Impact and Legacy

In his major work, *The Idea of Philosophical Medicine* (*Idea medicinae philosophicae*), Danish Paracelsian Petrus Severinus (1540/1542–1602) suggested the possibility of capturing the spirit in the form of a material entity, which could be manipulated by the art of chymistry (Severinus [1571](#)). For him this entity was the foundation of the “universal medicine” (*medicina universalis*), able to cure all kinds of diseases. Despite multiple names used by his forerunners, Severinus focused on one divine material, “vital balsam” (*balsamum vitale*), which he believed to hold the secret of life in the bosom of animals, plants, and minerals. Later in the early seventeenth century, his followers such as French Paracelsian Joseph Du Chesne (1546–1609) and English theosophist Robert Fludd (1574–1637) were eager to seek

the material spirit of life in view of achieving their dreams of the universal medicine and the prolongation of life (Debus 1984; Clericuzio 1994).

Stars in Renaissance Science

Matteo Cosci

Università Ca' Foscari Venezia, Venice, Italy

Abstract

Stars remained favorite objects of observation during the Renaissance, both from an astronomical and astrological point of view. New, accurate observations of the so-called fixed (*stellae fixae*) lead to a long re-discussion of many unsettled issues in regard to their nature, such as the understanding of their origin, form, number, light source, twinkling, dimension, position, distance, apparent fixity, and incorruptibility. The revision of traditional conceptions for each of those debated aspects contributed in general to the radical rearrangement and subversion of the Aristotelian-Ptolemaic cosmic model and in particular to the abandonment of the idea of existence of an outer crystal sphere where stars were presumed to dwell and eternally wheel around. Moreover, the discovery of variable stars, the display of unprecedented telescopic observations, and the unexpected appearances of novae in the heavens urged the scientific community between the end of the sixteenth century and the beginning of the seventeenth century to entirely redefine centuries-old notions of unchallenged stellar astronomy. At the same time, the production of more and more precise constellation maps, celestial globes, and star charts helped to reach a better comprehension of the arrangements of stars in the night sky and their relative positions in both the celestial hemispheres, especially for and thanks to intercontinental navigations.

Synonyms

Astral lights; Historical supernovae; Sidereal lights; *Stellae fixae*; Variable stars

- Spirit in Renaissance Medicine

Heritage and Rupture with the Tradition

Stars have not always been conceived as celestial bodies made of hot gases radiating luminous energy. In Renaissance times, the debate about the origin and the nature of the stars was conducted swinging between two opposite theses: stars were either considered immaterial lights or were regarded as solid, shining bodies. For instance, according to Francesco Patrizi, a Neoplatonic philosopher operating in Italy at the end of the sixteenth century, stars were pure concentration of aethereal light, which entirely lacked any physical or corporeal constituent (*Nova de Universis Philosophia*, Ferrara, 1591, in particular *Pancosmia* c. 20r). Behind this conception there was still the view of Aristotle, according to whom stars were immortal living entities made of translucent quintessence that were thought to be “divine” and similar to gods in consideration of their unchanging perdurance and (apparent) eternal motion (Segev 2017, pp. 93–94). On the other hand, around the beginning of the seventeenth century, the presence of some physical component was devised as a necessary requirement for the existence of stars as they stand. Kepler, for instance, claimed the compulsoriness of some solid nature for the stars and for catalyzing out their light. For him even in the case that they were conceived just as some sort of mirrors reflecting the solar light and not as active light sources, it was maintained that stars had to have some substrate. However not even Kepler denied their aethereal essence but reorganized its structure into the forms of regular solids and supposed its origin by the way of spontaneous ignition within the Milky Way through the universal activity of a natural faculty of the living cosmos (Boner 2009, 2013, pp. 69–103).

Kepler’s account aside, however, at the beginning of the seventeenth century, it was generally believed that stars were dense accretions of aether having spherical form that were transported around the heavens through a transparent crystalline celestial vault, i.e., the so-called eighth spheres of the fixed stars, where stars were firmly accommodated along its circular motion. The spherical shape as such was considered to be the

most perfect form and – by analogy with the spherical forms of the Sun and the Moon – it was the form that in the superlunar world was presumably assumed by all the heavenly aethereal bodies in their turn. This was, for instance, the opinion of the French astronomer Jacques du Chevreul (*Sphera*, Ch. IV *De stellis*, Paris, 1623, cc. 74–75).

The alleged incorruptibility of the stars was justified by making reference to the absence of any visible variation in long-term observations of their appearance. The common explanation was that the aethereal material by which stars were made was incorruptible and inalterable by itself. In fact, aether for Aristotle and his aftermath was a transparent, meta-elementary material without a polar opposite in which it might physically turn, so that it was considered to be immune to corruption and decay. According to the aforementioned Jacques du Chevreul, the stars should have been thought of as denser and rarer parts of the heavens, so that in this way they could propagate a different amount of light in relation to their density and rarity, without affecting the assumed eternal homogeneity of the heavens (Ariew 2001, p. 576). However the unexpected outburst of glaring novae or new stars, as when “Tycho’s Supernova” appeared in the constellation of Cassiopea in 1572 or the “Kepler’s Supernova” appeared in the constellation of Ophiuchus in 1604 (cf. Thorndike 1941; Weichenhan 2004; Tessicini and Boner 2013), as well as the discovery of variable stars, as in the case of *omicron Ceti* or “Mira” – the wonder – first spotted by David Fabricius between 1596 and 1609 (cf. Bobrovnikoff 1942; Hoffleit 1997; Hatch 2011), paved the way to think the stars as subject to change as every other material occurrence in the sublunar world (Granada 2007).

The denser/rarer aether thesis was believed as a plausible account of the nature of the stars also in consideration of the different stars’ dimensions that were classified in six “magnitudes” or sizes since Ptolemy’s time. The telescope of Galileo showed for the first time the existence of stars with a magnitude inferior to the sixth that were shining in the night sky but were invisible to human eyes. Galileo also revealed the real nature of the Milky Way as an aggregate of very close

and previously inseparable stars on sight and not as the atmospheric condensation that it was usually believed to be.

Regarding the possibility of enumeration of the stars, the main source was still Ptolemy's *Almagest*, which listed 1022 fixed stars. In Renaissance times, this number was accepted as the standard reference number over Aristotle's and even over the Bible's claims, according to which stars were countless and innumerable. Still in 1611, for instance, the Croatian philosopher Giorgio Raguseo reported that precise number as the prevailing quota shared among mathematicians (Camerota 2014); he maintained so despite the publication of Galileo Galilei's *Sidereus Nuncius* in the previous year, where, as said, telescopic observations proved the actual existence of an infinitely higher number of stars that had been never counted before. Apparently, Raguseo and the mathematicians were also unaware of the imposing naked-eye observations that Tycho Brahe achieved some years before, probably because at first they had limited diffusion. For, "Tycho circulated his results, informally known as the 'thousand-star' catalogue, in handwritten form in January 1598 under the title *Stellarum octavi orbis inerrantium accurata restitutio*. An abridged version, containing a subset of 777 of the most accurately determined star positions, was printed in 1602, the year after his death; it formed part of a much larger book called *Astronomiae Instauratae Progymnasmata*. Tycho's thousand-star catalogue was eventually edited and published in 1627 by [...] Kepler. This catalogue formed part of the *Rudolphine Tables*, which were primarily tables for calculating planetary positions (they were named 'Rudolphine' after the Holy Roman Emperor Rudolf II)" (Ridpath 1988/2017; cf. also Verbunt and van Gent 2010). Once they spread, these new catalogues superseded the Ptolemaic list of stars contained in the *Almagest*, and stellar astronomy could then make more secure and wide steps forward.

The observational study of the stars lead to collecting position data for making reliable constellation maps and star charts in the renewed field of celestial cartography. The need for locating stars with precision pushed to an unprecedented

level of accuracy the traditional depiction for decorative purposes of the stars and their constellations. Although the first representations were just mythological figures printed aside from classical astronomical texts, such as Hyginus' or Aratus' *Phaenomena*, star maps started to be produced for astronomical and practical purposes, such as for navigation or for astrological reference. The first attempts to provide in print some kind of coordinate system with a basic magnitude scale for observation and reference can be listed as follows: A. Dürer's iconic double woodcuts (1515), A. Piccolomini's star atlas *De le stelle fisse* (1540), J. Honter's constellation maps in his *Rudimenta Cosmographica* (1542), G.P. Gallucci's pluriedited star catalogue *Theatrum Mundi et Temporis* (1588), and Th. Hood's celestial hemispheres, which was published as attachments to his book on *The Use of the Celestial Globe in Plano* (1590). In the seventeenth-century stellar cartography, one work stood out for its novelty and overall quality: it was J. Bayer's *Uranometria Omnium Asterismorum*, whose first edition in 1604 was at the head of a long series of reprints. There, Greek letters were introduced to name the stars according to their magnitude in the relative constellation and an accurate grid system was adopted for the location of the stars from the geocentric observational perspective. Many derivative star atlases were eventually influenced by (or even plagiarized upon) Bayer's achievement, until J. Hevelius' star catalogue and maps in his posthumous *Prodromus Astronomiae* (1690) were presented as the last original comprehensive collection of systematically observed stars and constellations.

"Other new constellations were created during the Renaissance in order to corporealize areas of stars that had been recorded, but were noted as unformed or outside the boundaries of any particular Ptolemaic constellation. In 1536, Caspar Vopel introduced *Coma Berenices* and *Antinous* on a new globe. In 1589, Petrus Plancius and Jacob Floris van Langren added *Crux* and *Triangulus Antarcticus*, likewise on a globe. In 1592, Plancius created *Columba* and *Polophylax* on the inset celestial maps of a larger world map. Plancius added nine biblical themed

constellations in 1612 on a globe produced in conjunction with Pieter van den Keere. Jakob Bartsch replaced Plancius's *Apes* with his own *Vespa* in 1624, and Isaac Habrecht II introduced *Rhombus* (an early predecessor of *Reticulum*) on his celestial globe of 1625" (Friedman Herlihy 2007, p. 104). Moreover, a more complete knowledge of the celestial Southern hemisphere was reached as an increasing number of expeditions took place under those untraced skies, especially after P.D. Keyser and De Houtman's austral voyage in the mid-1590s (cf. Dekker 1987).

A further debated issue regarded how to explain the typical starry twinkling. Aristotle referred to the faint flashing as the shortcoming of human eyes on long-distance sights; however Renaissance astronomers, such as, for instance, Aversa, attributed the reason for the optical shak-ing to the irregular glare of light from stars' opaque surfaces, while others, such as, for instance, Brahe, Serbellonius, and Scheiner, supposed an interference by the external medium between the observer and the stars, like agitated air, interposed vapors, or fluid aether. In his *De Immenso* (1591), Giordano Bruno claimed that the twinkling of the stars had to be intended as a result of their axial rotation, extending then this theory to the Sun (*Opera latino conscripta*, I, ii, pp. 42–44).

Two main opposite theses were defended in Renaissance astronomy regarding the presumed source of starlight: either the stars were self-luminous bodies or they were receiving their light from the Sun. At the end of the sixteenth century, the Coimbra Jesuits still claimed that the most common and shared opinion was the latter. Nonetheless, thinkers like Giordano Bruno or Nicholas of Cusa had already previously assumed that all celestial bodies were like self-luminous Suns (Dick 1982, pp. 40; 108). Successively, stars' self-luminosity was accepted and upheld by Kepler, Aversa, Descartes, de Arriaga, Poncius, and Riccioli. Although it would have become the standard view in the second half of the seventeenth century, there was still someone (like, for instance, George of Rodi, in 1671) that instead maintained the Sun as the only actual light source for the fixed stars (Grant 1994, pp. 415–419).

Finally, between the end of the sixteenth century and the first decades of the seventeenth century, the very existence of the outer sphere of the fixed stars was called into question. Stars began to be no longer thought of as disposed on the surface of the external celestial vault according to an equal distance from the Earth and indeed the very idea of a "celestial vault" as such started to collapse. As Earth's rotation was accepted so that distances turned out as relative distances and movements as apparent movements, also "the idea of stars scattered through an indefinitely large space was immediately appealing, and acquired theoretical plausibility" (Donahue 1981, p. 209). Nonetheless, the dissolution of the outer bounding sphere opened the universe as it was known as infiniteness – a cosmological conception that was itself controversial, in consideration of the unique and undisputed infiniteness of God. In absence of a bearing support, stars' motions were intended as inherently dependent on their own substantial forms, which allowed them to proceed in perfect accord without the need of a moving intelligence underneath. In some cases, the omnipotence of God was extended also to direct or angelic motion of the stars, so that not even in this scenario a solid sphere was still needed (for, stars as such were generally considered incapable of self-motion). In some other cases, the aethereal crystal of which the stellar sphere was thought to be made was conceived as fluid, nebulous, or even spiritual-pneumatic matter where stars were all floating in the cosmic swirling stream before that its presumed consistency was disregarded and its alleged solidity was completely dismissed (ibid.).

Last but not least, nocturnal stargazing was generally considered a useful practice for relevant sectors of civic life, such as political astrology and astrological medicine. In fact, it was commonly believed that the positions of the stars and planets, in general, exerted their influence over the balance of bodily fluids or human humors. Therefore health and temperament of the entire population depended, among other factors, on stars. Accordingly, health treatises known as *regimina sanitatis* usually devoted long sections to the study of the movements of heavenly bodies and how they could predispose dangerous conditions of illness

on the Earth. Interpretation of celestial figures was considered also relevant for political decision-making, as, e.g., taking some possible actions or making some timing interventions, casting natal horoscopes of future sovereigns, providing genitures for political propaganda, or foreseeing the likely death of an enemy (Azzolini 2005, 2013).

State in Renaissance Politics

Tiziana Provvidera

University College London, London, UK

Abstract

The modern state is the new form of domestic and international political organization in the European system of relations between the

fifteenth and seventeenth centuries. Its origin lies in the crisis of the medieval order and in the detachment of sovereignty from the earliest popular and territorial bases. While the formulation of the concept of sovereignty is conventionally associated with the emergence of the modern states-system culminating in its political formalization with the Westphalian settlement of 1648, it was in the late Middle Ages and definitely during the Renaissance that the word "state" acquired a meaning close to the modern sense. It was around this time that discussions about the state as a separate entity and its purpose and powers became widespread in the political language. A historic analysis of the word "stato" shows its multifarious meanings and the difficult process it went through from antiquity to Machiavelli before being accepted in its modern sense by scholars. Yet Bodin and Hobbes became the focal points for the birth and development of the modern state with the concept of sovereignty associated with it.

Heritage and Rupture with the Tradition

Any discussion about the state in Renaissance politics must begin with Swiss historian Jacob Burckhardt's claim in his 1860 work *Die Kultur der Renaissance in Italien* that fifteenth-century Italian intellectuals and politicians created a new sort of polity, "the state as a work of art." By this expression, undoubtedly of Hegelian origin, Burckhardt pointed to the creativity and energy that characterized the Italian city-states, not unlike the artistic "spiritual individuals" he so admired. Like a Renaissance painting, the state was a work of many hands, artfully rendered by those who held power in many regions of Italy. It is in this elaborate and self-conscious process by which Florence, Milan, Venice, and other Italian Renaissance republics and principalities developed their forms of governance in the late fourteenth and fifteenth centuries that for the first time, Burckhardt suggested, it is possible "to detect the modern political spirit of Europe" (Burckhardt 1958, I, p. 22). More specifically,

the “Florentine spirit,” at once critical and artistically creative, has incessantly transformed the city, “which in this sense deserves the name of the first modern State in the world” (Burckhardt 1958, I, p. 95). Nevertheless, the individualism of the Renaissance for Burckhardt could sometimes result in “an amoral egoism, indifferent to the good of the community and destructive of the moral values necessary to the survival of civilised society” (Hankins 1995; Gilbert 1990). In this perspective, the state came to be conceived as a calculated technical structure aiming at achieving specific goals within a community, whereas politics was the art of the rulers to mold the matter of humanity “into whatever form they desired,” as Machiavelli puts it (Machiavelli 1995, *Il principe*, chap. VI, p. 33). Almost a century after Burckhardt’s book had appeared, the Italian historian Federico Chabod dismissed as bizarre the Burckhardian vision of Renaissance Italy as the birthplace of modern individualism, political calculation, and skepticism. Averse to any attempt to equate Renaissance states with modern states of the nineteenth and twentieth centuries, Chabod argued that the most significant feature of the Renaissance state was a staff of trained officials with distinctive habits and a collective identity that carried out well-defined tasks impartially (Chabod 1958). If the modern state did not yet exist in the Renaissance, it was, argues Chabod, first anticipated in the erratic bureaucratic apparatus of the Italian *signorie* and principalities as well as in the institution of a standing army. This process was also aided by the growth of diplomacy, which took its place beside the new warfare when the Italian city-states established resident embassies at foreign courts. Thus, the emergence of a bureaucratic apparatus free of personal ties placed Italy within the broader European context of modernization. Such a centralized model, clearly reminiscent of Max Weber’s sociology of the bureaucratic state and city, was in turn criticized and resolutely opposed by Marxian historians and the later Gramscian tradition: rather than being a sign of modernity, the autonomous development of regional states in the Italian Renaissance resulted in the loss of communal liberties, social involution and economic stagnation (Romano

1972; Vivanti 1972). Yet, a decisive shift away from Chabod’s “modern,” centralized, and highly bureaucratic vision of the state toward a pluralistic and decentered model was prompted by a new emphasis on the territorial dimensions of the Italian states. A more accurate enquiry into the historical-political process that from communes – unable to give a state order to Italian society – led around the middle of the fifteenth century to the creation of new structures, places the origin of the modern state precisely both in the regional states and in the more or less contemporary European national monarchies, such as England, Spain, and France (Chittolini 1979a, b, 1994). The rise of these territorial systems, grounded on cities, towns, and village communities, each with their own councils and governing bodies, provided a stimulating input to the study of particularisms, local autonomies, and diverse centers of powers. By focusing on them, historians have brought out the essential role played by ties of kinship, clan, and faction, by patronage and clientage, and their share in shaping political strategies and influencing social dynamics (Fasano Guarini 1983). A thorough investigation of such “privatistic” political practices, as well as of their interaction with those formalized as “public” or state institutions, may offer a better understanding of the process involving the emergence of the so-called “modern state” (Chittolini 1994; Fasano Guarini 1994a, b). At the same time, a parallel between the development of the state and the regionalization of economy has also been suggested (Malanima 1986; Mirri 1986). Finally, more recent historical inquiry on the late medieval and early modern state calls attention to both the political, economic, artistic, and cultural innovations and achievements that took place in Renaissance Italy and the weakness and failure of Italian republics, principalities, and rulers in the evolution of the modern European political identity (Gamberini and Lazzarini 2012).

Research on the rise of the modern state has continued and even intensified in the last several decades, with particular attention to the political thought of the Italian humanists. Nevertheless, the significance of Chabod’s analysis lies in having questioned the alleged Italian peculiarity in the

building of the modern state. As a result, recent scholarly debate mostly focuses on the interrelationship of the Italian states between the fourteenth and early sixteenth centuries with the wider European context, even though they had their own specific development. Indeed, the formation of lordships and principalities in Italy paralleled the formation of the great monarchies in Europe, that is, France, Spain, and England. In France, the Capetians gained control of nearly all duchies by staging internal wars and defeating England in the Hundred Years' War (1337–1453). They established a line of strong monarchs that lasted for eight hundred years and elevated France to the status of a major power. Although England was exhausted from the long conflict with France, the Tudor monarchs began a new dynasty after emerging victorious from the War of the Roses (1455–1485), a struggle between two families for control of the throne of England, and reigned until 1603. In Spain, the monarchs Ferdinand II of Aragon and Isabella of Castile laid the foundation of an immense empire by uniting several independent provinces. In the sixteenth century, during the reign of King Charles I, later Emperor Charles V, the Spanish empire spread east from Spain to include the kingdoms of Germany, Hungary, Bohemia, Naples, and Sicily. It also extended south and west to include possessions in North Africa and the Americas. Although it is difficult to identify with the same accuracy the beginning for each individual country of the creative process leading to a new state structure, all evidence suggests that the nation-state system came about in medieval Western Europe as a result of the fading political dominance held by the feudal lords and the Catholic Church. The rejection of the Church's claims to temporal power along with the decline of personal feudal obligations were necessary preconditions for the emergence of the territorial state. In government, city-states and regional and national principalities replaced the fading hegemony of the empire and the papacy and eradicated many of the local feudal jurisdictions that had covered Europe. This process was consolidated by two other developments that undermined the essential structure of feudalism: the growing

commercialization of the economy and the urbanization leading to the entry into political life of autonomous burghers (Gill 2016). Owing to increased trade, towns began to develop as centers of commerce. Over time, some of them demanded independence (or at least semi-independence) from their feudal masters. Gradually, the feudal manors lost their political dominance to trade and accumulation of money. Mobile capital was a resource for a new type of emerging state. This power vacuum created by the waning of the feudal lord's power gave rise to a new type of ruler: a single national monarch. Increasingly, people were no longer bound to their ruler by an oath; rather, they were citizens of cities and towns who enjoyed certain privileges and rights. These rulers in turn could consolidate more and more land under their control. Hence, new forms of co-ordination and dominion (regional states) overlaid the plurality of powers that had come into being independent until the end of the Middle Ages in the countryside (rural lordships) and in the cities (communes). This embryonic form of the modern state, resulting from the dissolution of the feudal society, presupposed that the state was first and foremost a power structure and that it had to be organized to make ruling and obedience effective. The principle of territorial sovereignty as articulated by the late Middle Ages and the Renaissance was to last for several centuries. Upon this foundation a new system and new concepts of statehood could arise.

Innovative and Original Aspects

While the Middle Ages witnessed the rise of complex structures of interaction between institutions, the ruled and rulers, the early modern period altered such framework significantly. During the sixteenth century, almost all the emerging European nation states, from the smallest Italian regional states to the largest, such as the Spanish Empire, display similar characteristics. Firstly, the territorial principle had to become the dominant form of organizing large-scale society. This had to be combined with the centralization of power and authority within that territory as well as with a

legislative, judicial, and fiscal unification. Furthermore, the function of sovereignty had to be fully autonomous, undivided, able to rely on its own strength and on an independent legitimacy. Louis XI of France, Henry VII, and Henry VIII of England and the Catholic Kings of Spain were the great sovereigns who played a leading role in the emergence of the modern state. The territorialization of governance also implied a new concept of political obligation: by virtue of living within distinct boundaries, people acquire obligations, independently of personal relations, vows, faith, or origin (Morris 1998). Associated with this was the emergence of a sense of national unity, although in the early modern period it was restricted to the elite levels of the society. The other fundamental principle distinguishing the modern state from the medieval political forms was the separation of the persons of the rulers from the office and institutions they occupied. During the sixteenth century, however, even this distinction was far from being clearly defined. The royal power, in fact, still retained some feudal features: the sovereign ruler(s) heads a hierarchy of vassals, keeping the idea of a personal and contractual bond between ruler and subjects. As a matter of fact, the Renaissance is a hierarchically structured world, in which “a tendency toward concentration of power is systematically counterpoised by recognition of positions of privilege and community rights and by acknowledgment of special powers of political agency” (Chittolini 1994, p. 49). In this context, within which subjects guarantee obedience and loyalty to their ruler providing the recognition of their own privileges, customs, systems of autonomous representations (parliaments, assemblies of states, etc.), the boundaries between public and private are rather equivocal, as the linguistic distinction between “state” and “government” is ambiguous.

The concept of the modern state developed along with the vocabulary in use in the political writings of the Renaissance. In the period from classical Latin to the thirteenth century, there is no univocal meaning of the word *status*, which for a long time remained almost alien to political language. The terms *imperium*, *regnum*, *principatus* were mostly used, while the word

respublica, a term applied in fact to a wide variety of regimes, signified the state until the seventeenth century. In the early thirteenth century, for instance, “state” came to indicate the situation in which one could enjoy the associated life or the prosperity of a specific community without any reference to a specific territory or to a politically structured organism. In this idea, there is no “government” (*regimen*) of the republic in the sense of something that is found above and beyond the welfare of the citizens. Between the thirteenth and fourteenth centuries, *status* had also come to designate the “state” or “condition” of a realm or commonwealth (*status reipublicae*), as well as of cities as independent political entities (*status civitatum*), as was the case in the Italian communal tradition. This use of the term, dating back to ancient Rome, corresponds, in its turn, to the *status regni* as used in medieval England, and ultimately to the *status rei Romanae* in *Digest* 1.1.1.2, referring to the condition or to the state of the people’s affairs and not to the bodies of magistrates in charge with running these affairs (Rubinstein 1971; Tenenti 1987; Skinner 1989). Yet, in the latter half of the fourteenth century, particularly in the well-established monarchies of France and England, *status* is generally related to the state of majesty, a high estate, a condition of grandeur, not to the state as a separate apparatus of government (Skinner 1989). This idea is perfectly consistent with the medieval vision of the state according to which royal sovereignty, given its divine origin, is mostly above the law. It was mainly the constitutional rehearsal of the *regna* and of the *civitates* in Italy that called into question the principle of the *plenitudo potestatis*, on which, albeit in different ways, both the papacy and the empire had founded their universalistic claims.

The consolidation of independent communes across central and northern Italy in the mid-thirteenth century also coincided with the rediscovery and translation of Aristotle’s *Politics*, a text that provided the early structure and style of city-state political culture. The recovery of Aristotelianism points to the problem of the conception of political sovereignty and its relationship with the emerging idea of state. It was precisely

after William of Moerbeke's translation of Aristotle's *Politics* around the year 1260 and Thomas Aquinas's unfinished commentary upon it, which he began in 1269, that in late medieval and Renaissance Italy the word *status* came also to designate the form of political regime of a community. Aquinas was well acquainted with both aspects of the state, the whole commonwealth, and the specific regime that gives it form and direction. In his main works, he raised the question of how a judge or a magistrate can promote the common good, or what it means for a *civitas* or *respublica* to attain its best state, a topic that will later be developed into the question of how the good *status* of a community is to be preserved. Going back to Aristotle's famous distinction as developed in the *Politics* between the ideal and perverted forms of government, Aquinas shows a strong preference for the rule of one (monarchy) as the most appropriate regime to ensure social unity and peace. Dante's views of the government were heavily influenced by Aristotle and Aquinas too. Taking an Aristotelian perspective, in his treatise *Monarchia* (probably written after 1308), Dante ardently believes that humanity, being ordained to an end, should have a single unified government in the form of a temporal monarchy or universal empire. However, Dante's supreme ruler is more likely an international overseer and arbitrator rather than a despot: what makes him a good leader is not obligation or interdependence with his subjects, but his absolute freedom from worldly influences and desires. Such a magnanimity, together with the divine order of the universe, limits his sovereignty: in pursuing the state's objectives, a universal monarch serves the population, thus aligning the universal monarchy with the achievement of individual happiness. Dante's belief in a separate existence of the church and state and his theory of limited sovereignty can also be found in Marsilius of Padua (1275 ca.-1342/3), who advocates world peace through unified temporal sovereignty. His *Defensor pacis* (1324), one of the most original political treatises produced during the Middle Ages, played an important part in carrying ideas of popular sovereignty and against the jurisdictional pretensions of the church, thus significantly influencing the modern

idea of the state and particularly the Machiavellian state.

It was precisely during those two centuries, going from Marsilius to Machiavelli, that the premises of a political reflection took place which, by combining some issues of both the late medieval legal theory and the classical political thought, laid the theoretical foundation of what would be the "modern state." Yet, modern historiography has not fully stressed the importance of the humanists' contribution to the issue of the modern concept of state and sovereignty, whereas greater emphasis has been placed on what has been regarded as the "Machiavellian" revolution. Similarly, the theoretical ties deeply linking Petrarch's thought and the fifteenth-century political treatises have not yet been adequately and exhaustively investigated. In the early Quattrocento, Renaissance humanists had to deal with the new political world dominated by two basic forms of government, monarchy and oligarchy. While at the beginning of the fourteenth century, Italy appeared as moving towards unity with the flourishing of city-states, the situation dramatically changed in the Quattrocento: by that time five major states – Venice, Milan, Florence, the Papal State, and the Kingdom of Naples – and a host of smaller city-states and signories were competing to dominate the Peninsula (see ► "[Politics, Renaissance](#)"). This new political framework involves in turn a change in political perspective. Hence, the main focus of humanist writers like Bartolomeo Platina (1421–1481), Francesco Patrizi of Siena (1413–1494), and Giovanni Pontano (1426–1503) was the legitimacy of the rulers and the obedience of the citizens (Cappelli 2012; Hankins 2019). They elaborated and developed a political doctrine of the state strongly based on the concept of organicism, namely, the representation of society as an organic body (*corpus mysticum*) inside which every member (*animae partes*) performs a specific function and the king is its visible representative, a reflection of the *unitas* that should be the basis for all social and political structure. According to this view, the political legitimacy of the state is tightly linked with the virtue of rulers, which, in turn, is both the guarantee of the consensus and a moral bond of

obedience of the citizens. Central to the humanist conception of the state is the notion of *amor* or mutual *caritas* between the prince and his subjects. Such a notion implies the prince's scrupulous and public compliance with a universal system of moral virtues (Cappelli 2012, 2016). This traditional humanist doctrine was rejected and completely overturned by the "revolutionary" Machiavelli.

Following a series of changes that affected its main meaning, between the fifteenth and the first half of the sixteenth century, the term *status* crept more and more into political and ideological discourse, gradually acquiring a moral and social connotation both in Italy and in the main European monarchies. By this stage, the process of state-building eventually meant an increasing concentration of legitimate political authority as well as the accumulation of power in the same hands or in the hands of relatively few people, the result of chronic factional rivalries, oligarchic coups from within and mercenaries from without. This is the case of the centralized princely state being championed in the age of Machiavelli. Thus, this notion of state refers to the exercise of political direction, generally connected to winning and maintaining personal domination, without specific reference to those who hold it. In this respect, the medieval proposition that the preservation of liberty, law, and justice constitutes the central aim of political life was challenged by Renaissance theorists. They contended that the central task of government is to maintain security and peace. As a result, one of the main questions addressed in the Renaissance genre of advice books for princes was how rulers should act to secure and preserve their state, that is, to uphold their status or standing as princes. This marks the beginning, as Skinner put it, of "the most important linguistic innovation" that can be traced in the political writings of Renaissance Italy, that is, the use of *stato* to denote "the institutions of government and means of coercive control that serve to organise and preserve orders within political communities" (Skinner 1989). Machiavelli's *Il principe* (written in 1513), the most celebrated treatise of this kind, is almost entirely devoted to this issue. His usage of *stato*, whose occurrence is

second in the text only to the word *principe*, seems to suggest that he meant by it political power to be grasped vigorously and exercised with subtlety by one person or a group over the rest. According to this view, the state is literally owned and molded by whichever prince happens to have control of it, thus reflecting the characteristic claim of the ruler. In this case, by linking the ruler and his dominion, Machiavelli does not conceive the modern state as an abstract political body that transcends the individuals who compose or run it (Mansfield 1983; Skinner 1989). Some historians have also underlined the exploitative nature of the meaning of the term "*lo stato*" in *Il principe* as passive, that is, "the instrument the prince uses to get what he wants," no matter the particular form of his regime (Hexter 1957), whereas it is in the popular republic as envisaged in the *Discorsi sopra la prima deca di Tito Livio*, printed posthumously in 1531, that the seeds of an early modern theory of the state may be detected (Pocock 1975; Skinner 1989). In a more radical analysis, the multifariousness of the term "state" in his works has been explained as Machiavelli's plea for a form of a state where "no part of society, no estate should be in a position to rule over others" (Vatter 2014). In this view, Machiavelli set the groundwork for a republican conception of the state (Viroli 1992; Vatter 2014). Undeniably, it is most difficult to assess whether Machiavelli has in view a particular regime or an impersonal state. Likewise, so many divergent usages do not fall easily under a clear and coherent concept. In several passages of *Il principe*, "*stato*" is related either to a prince and to the maintenance of his personal condition or to the lands or collection of territories over which he (or a republic) holds sway. In this respect, Machiavelli's expression "matters of state," as he put it in his private letters to Francesco Vettori, can be explained with his following the diplomatic usage of identifying "state" (condition or station) with dominions (Descendre 2014a). Yet, there are instances, particularly in the opening sentence of the treatise and in the *Discorsi*, where it also refers to particular regimes or constitutions, or a type of political organization having the power to act or command (Rubinstein 1971). In this context, it is sometimes

used also to describe a group of people under one form of rule. As a result, the word “state” in Machiavelli’s literary output appears to embody all of these meanings: private property (*dominium*), political power (*potestas*), and political regime (*imperium*), thus referring to both an abstract and impersonal political and jurisdictional structure and to a concrete domain over which power is exercised (Chiappelli 1952). The issue at stake is the relation between Machiavelli’s discussion of the most appropriate ways to hold, consolidate, and preserve princely rule and power and his more general concern with the shape or the form of the republic, namely, the concepts of *dominium* and *libertas*. As claimed in *Il principe* “good laws [*buone legge*],” in combination with “good arms [*buone arme*],” are the foundation of all states and societies. In addition, military discipline and laws must be supported by religion, the latter being useful and even necessary to political stability inasmuch as it both promotes virtues and creates ties that bind citizens closer together. Machiavelli was convinced that a society that does not have these three ingredients in good measure (as was the case in Italy in his time) lacks the means for greatness. By stressing the need for a national army as an essential requisite for the independence and unity of a nation as well as by urging “the people” to react against the authority exercised by either the Catholic Church or foreign powers, Machiavelli placed himself among the forerunners (if not the founders) of the notion of the nation-state (Chabod 1961).

Machiavelli’s modernity has been variously disputed by scholars. Yet, the more interesting question is what kind of state Machiavelli is referring to when he uses this term in his political writings. Just as the meaning of the word was indeterminate, so there was also no single version of the “state” in the Renaissance. Actually, the political systems and governments that were taking shape during that period, particularly in Italy, were very articulated and complex. In the fifteenth and the sixteenth centuries, the archetypal Italian city-states went through several changes in their configuration as the peninsula was plagued by both internal wars and foreign interventions. After the French invasion of 1494, petty

principalities, self-governing republics, kingdoms and tentatively territorial states comprised the political system of Renaissance Italy. The beginning of the sixteenth century provides a striking picture of the situation: though five political authorities dominated the greater part of the territory – the Kingdom of Naples (including the Kingdom of Sicily), under Spanish rule after 1442; the Duchy of Milan; the Republics of Venice and Florence; and the Papal State – the remaining states scattered throughout Italy numbered over 100 (some of them obviously quite small). The works of Machiavelli, who in 1512 had himself experienced the collapse of the Florentine republic, were intended to offer a practical and intellectual response to the political crisis of his age that had resulted in the dismantling of the central mechanisms of republican government. Therefore, his idea of the state was not only inspired by, but also intended to be applied to, the Florentine political situation of the day. By departing from the Aristotelian tradition and medieval treatises, Machiavelli analyzes only two of the basic types of regime, namely, principalities and republics in *Il principe* and in the *Discorsi*, respectively. These in turn may have two different forms of government, aristocratic and popular rule. If *Il principe* appears as the theorization of the “civil” or “popular” principality, that is a principality founded on the support of the people, the *Discorsi* are the celebration of the *stato libero* or *repubblica*, or that state that is able to tame differences between social forces and adequately compose the nobles and the people, thus avoiding the double excess in the oligarchic and ultra-democratic sense. Although celebrating the individual virtue of the prince, Machiavelli’s preference goes for a republic in which the solidity of the state resides in the *leggi* and *ordini*, namely, that “distinctive bundle of laws, social and political institutions and customs which he regards as the product of successful state formation” (Stacey 2013, p. 180). Whereas in the principalities there is the thorny problem of personal succession to power, in the republics continuity is ensured by an interweaving of opposing forces that prevent the dominance of a single individual authority, thus preserving freedom and balance of power. In this

regard, Machiavelli considers the tripartition of the Roman republic as an ideal model: consuls, senate, plebs. His solution consists of a republican constitution stipulating a degree of civic participation that ensures that the citizen body as a whole is involved in government. With these arrangements in place, no individual person or faction can be said to be imposing their particular will upon the whole body politic. As a result, *lo stato* does not correspond to any single type of naturally occurring regime. On the contrary, it is a peculiar entity that Machiavelli comes to call a *corpo misto*, or mixed body. The new and civil-popular principality thus appears to be the “virtuous” response to the crisis of a self-governing republic, in which internal clashes prevent the renewal of the republican experience; in short, it is an “exceptional” solution, an “extraordinary” way of dealing with the crisis at a time when the “ordinary” ways are powerless in the face of disaffection with public affairs. In this respect, Machiavelli’s modernity lies in the way he adapted and applied his ideas and concepts to a set of problems, which he took to be pressing in his age (Sasso 1980).

Impact and Legacy

Machiavelli was not alone among his contemporaries to use *stato* in such a multifarious and flexible manner. If the equation between *status* and *dominatio* (geographic connotation with reference to territorial dominion) was rather frequent in the political literature of the Italian humanists (Donato Acciaiuoli, Filippo Beroaldo, Francesco Patrizi, Vespasiano da Bisticci), current Florentine usage of the word also extended to the population over which the power is exercised, or, in a more generic sense, to political rights. Although the development of the concept of state as regime in late medieval and Renaissance Italy must be derived from Aristotle as interpreted by Aquinas, it was Leonardo Bruni (1370 ca.–1444) who in his early fifteenth-century translation of the *Politics* coined the expressions *optimatum status* for *aristocratia*, *paucorum status* for *oligarchia* and *popularis status* for *democratia*. In the case of despotic states, where *stato* as political regime

practically corresponded to *stato* as dominion, the two meanings were almost equivalent and overlapping (Rubinstein 1971). Soon after the rise to power of the Medici (1434), there was a shift in the meaning of the term from *stato* as power structure of the state to *stato* as prevailing regime. Finally, the word came to refer to an apparatus of political authority that served to preserve order within political communities (Skinner 1989). The centrality of the well-ordered political life in early sixteenth-century humanist treatises influenced the so-called utopian literature dealing with the attainment of the *optimus status*, the most representative of which is Thomas More’s famous book *Utopia* or *De optimo rei publicae statu* (see “Politics, Renaissance”). Parallel to this tradition, which goes back to Plato’s *Republic*, there are the contributions of the Florentine political writers of the thirteenth century, and particularly of quattrocento “civic humanists,” as Hans Baron described them (Baron 1966; Rubinstein 1971), centering on the idea that both individual and civil liberty, and therefore the common good, can be guaranteed best under the laws and institutions of a republic (Skinner 1989). Nevertheless, much research in recent decades indicates that Italian humanists generally avoided “exclusivist” preferences for a republican regime in the modern sense. Rather, they regarded the question of constitutional form as secondary to the issue of virtue, or as Hankins put it, “good government is ultimately about good rulers and not about ideal regimes” (Hankins 2019). However, a different *corpus* of political speculation on the rising European state existed during the time of Machiavelli. This was originated by the Dominican theologian and founder of the so-called School of Salamanca Francisco de Vitoria (1483–1546). Vitoria’s conceptualization of political society, informed by Thomistic and Aristotelian teleology, proved significant for the development of a modern conception of state politics and political ethics. In his *De potestate civili* (1528), Vitoria developed the organic conception of the state in which a *potestas* brings society into unity and directs it toward determinate ends as well as the idea that the state power is subject to moral authority. In this respect, Vitoria’s approach

provided a vigorous critique of both state practice and literature founded on the doctrine of the reason of State. Traditionally associated with Machiavelli – although he does not mention it – the idea of “reason of state” was promoted by Giovanni Botero (1544–1617) in his treatise *Della ragion di stato* (1589). A similar formulation had already appeared in Francesco Guicciardini’s *Dialogo del reggimento di Firenze*, drafted between 1521 and 1524, and in Giovanni della Casa’s 1547 oration to Charles V, with reference to foreign policy and military conquests, thus distinguishing “reason of states” (law of foreign relations) and *ius civile* (private law) (Descendre 2014b). As mentioned above, it is approximately the same meaning Machiavelli intended when he hints to “*cose di stato*,” a usage of the term that is perfectly consistent with the relevance that he assigns to international affairs. Instead, by defining the state “as a stable rule over people” and reason of state as “the knowledge (*notitia*) of the means suited to found, preserve and extend such power (*dominio*),” Botero detaches it from any juridical and ethical principle and avows its instrumental and political purpose. In this respect, the state takes on a kind of autonomy: it acts on its own for its own interest.

The doctrine of reason of state shaped political discourse from the sixteenth to the eighteenth century. However, the two authors who are traditionally credited with elaborating the political, juridical, and philosophical foundation of the modern state are Jean Bodin (1530–1596) and Thomas Hobbes (1588–1679), both of whom tried to conceptualize a system that could depict a distinct and indisputable source of authority. In *Les Six Livres de la République* (1576), Bodin maintained that supreme power is essential to the idea of the state, claiming that sovereignty is constituted as absolute power over subjects and must be both unlimited and perpetual. It was in France, torn by the wars of Huguenots and Catholics that Bodin also developed his arguments on the requirement of undivided sovereignty for a stable state. In contrast to Machiavelli, he further suggests that the idea of a mixed state is not simply contradictory but also highly untenable. Similarly, Hobbes’ realist views as expressed in

such works as *The Elements of Law* (1640), *De cive* (1642) and *Leviathan* (1651) viewed sovereignty as “absolute, indivisible, unified, and self-perpetuating” and were heavily influenced by the socio-political context of his time, the English civil war. According to him, sovereignty is the artificial soul of “that great Leviathan called a Commonwealth or State,” which is the ultimate source of political power within a realm. Like Bodin, Hobbes believed that only a supreme and unbounded authority could rescue a state from the brutality of the war, thus ensuring the peace and happiness of the citizen-body as a whole. The awareness of such a need for an impersonal form of sovereignty, together with the doctrine of unitary power, the distinction between sovereignty and government and the subordination of spiritual power to secular authority paved the way to the birth of the modern state in Western Europe.

Abstract

Agostino Steuco – Canons Regular of the Lateran, Counter-Reformation humanist, Biblical scholar, and prefect of the Vatican

Library – was undoubtedly one of the most representative thinkers in the history of Renaissance Neoplatonism. His major work is *De perenni philosophia* (1540).

Alternate Names

[Steuchus](#), [Augustinus](#); [Eugubinus](#)

Biography

Agostino Steuco was born in Gubbio in 1497 or early 1498. Christened Guido, he changed his name to Agostino when he entered the Order of the Canons Regular of the Lateran at the convent of San Secondo in Gubbio in late 1512 or early 1513. From 1517 to 1525, Steuco lived at the convent of San Salvatore in Bologna; and at the University of Bologna, he perfected his cultural training in ancient languages, philology, rhetoric, and history. In 1525 he moved to Venice, where he remained until 1529.

In Venice Steuco was in charge of Cardinal Domenico Grimani's precious library at the Augustinian convent of Sant'Antonio di Castello. Domenico Grimani, upon his death in 1523, “had deeded to the canons at San Antonio a great portion of his extensive library. This substantial endowment, which included many manuscripts and printed works that had once belonged to Pico della Mirandola, was especially rich in Hebrew, Greek, and Aramaic works, as well as patristic authors and philosophical writings” (Delph 1994: 106–107). Grimani's valuable manuscript collection offered Steuco an opportunity to deepen his studies and was a great source of inspiration for his writings. In 1529 Steuco published his annotations on Jerome's Vulgate with the title *Recognitio veteris testamenti ad Hebraicam veritatem*, dedicated to Marino Grimani, Cardinal Domenico Grimani's nephew. “What Steuco produced were a set of critical emendations of Jerome's Old Testament Latin text, based upon extensive use of the Hebrew, Aramaic, and Greek manuscripts in the Grimani Library. [...] Steuco's pioneering set of Old Testament annotations soon exerted a wide

influence among biblical scholars throughout Europe” (Delph 1994: 108–109).

In 1529 Steuco was nominated prior of the convent of San Marco in Reggio Emilia. In 1530 he published *Pro Religione Christiana adversus Luteranos*: “in this work Venetian republican ideas and patrician dominance of the city shaped his response to the reformers as he defended Catholic rituals and notions of the sacred” (Delph 1994: 104–105). In 1533 he returned to Gubbio as a prior of the convent of San Secondo and published *In Psalmum XVIII et CXXXVIII interpretatio. Epistola Erasmi Roterodami ad Augustinum Eugubinum. Augustini Eugubini ad Erasmus responsio*. In 1534 Steuco left Gubbio and relocated to Rome at the cloister of San Pietro in Vincoli. In 1536 he worked in the service of Pope Paul III (1534–1549). On 11 January 1538, Steuco was appointed bishop of Kissamos on Crete, and on 24 October he became prefect of the Vatican Library. “During his tenure, the papal library flourished and grew, and, among other things, he personally worked on a catalogue of the Greek manuscripts of the collection” (Schmitt 1972: VII).

In 1540 he dedicated to Pope Paul III his most famous work *De perenni philosophia*, in which title he coined the phrase “*philosophia perennis*” (Perennial philosophy). This expression designates the true philosophy which has existed from the beginning of humanity. The primeval unity and fullness of this knowledge is called “the universal agreement” or “Perennial philosophy” (see Schmitt 1966: 522). There is only one original truth and wisdom, revealed by God to all humanity and transmitted in different forms from ancient times to the later centuries in a perfect historical continuity. This primal wisdom is more ancient than Greek philosophy and, in fact, originates from other nations. Steuco writes: “Hereby the nations that originated first, and in whose lands was born and developed the history of the ancients, preserved more than other nations clearer and more authentic vestiges of those events. I am speaking of Chaldeans, Armenians, Babylonians, Egyptians, and Phoenicians. It is among these peoples that the Theology of the Ancients can be found partly clear and manifest, partly mixed with fables and intricate, and partly corrupted by impious figments” (Garin 2008: 399–400).

Marsilio Ficino (1433–1499) and Giovanni Pico della Mirandola (1463–1494) were the most significant philosophical predecessors of Steuco’s conception. On the one hand, there is Ficino’s notion of the *prisca theologia* as a *pia philosophia* and, on the other, Pico’s attempt “to utilize the philosophies and theologies of the past in the formulation of a single system of philosophical truth” (Schmitt 1966: 512). In particular, Steuco “really carries the program of Pico della Mirandola to its logical conclusion. Whereas Pico founds some elements of truth in all philosophical, religious, and scientific traditions, Steuchus sees all traditions as agreeing on most, if not all, important issues” (Schmitt 1972: XI). Moreover, in Steuco’s syncretistic perspective, the philosophical tradition is indistinguishable from the religion, and this fusion is of clear Neoplatonic inspiration. The true and perfect philosophy’s end is piety and contemplation of God: “the *philosophia perennis* has an epistemology in which God is knowable by human reason” and “it is a religious philosophy” (Schmitt 1966: 522).

In 1547, in the polemical work *Contra Laurentium Vallam de falsa Donatione Constantini*, Steuco “applied his expertise in Greek and Latin, and his abilities as a humanist historian, philologist and textual critic, to the task of forever disarming Valla’s treatise as a weapon to be used by the Protestants in the debate over the authenticity of the *Donation of Constantine*” (Delph 1987: 262). In 1547 Paul III invited Steuco to participate in the Council of Trent. We know that he stayed during the summer of 1547 in Bologna, where the Council had been transferred. On 3 February 1548, Paul III suspended the Council and Steuco moved to Venice for reasons of health. Unfortunately, on 18 March of the same year, Steuco died in Venice (Crocata 1987: 18–19). His corpse was buried in the church of Sant’Antonio in Venice and then transferred to the church of Sant’Ambrogio in Gubbio.

Major Agostino Steuco’s Works

Recognitio veteris testamenti ad Hebraicam veritatem, Venetiis, in Aedibus Aldi et Andreae Soceri, 1529.

Pro Religione Christiana adversus Luteranos, Bononiae, Ioannes Baptista Phaellus, 1530.

In Psalmum XVIII et CXXXVIII interpretatio. Epistola Erasmi Roterodami ad Augustinum Eugubinum. Augustini Eugubini ad Erasmus responsio, Lugduni, apud Seb. Gryphium, 1533.

Cosmopoeia vel de mundano opificio. De rerum corporearum, visibiliumque creatione. De rebus incorporeis, et invisibilibus. An vulgata editio sit divi Hieronymi, Lugduni, apud Sebastianum Gryphium, 1535.

De Aqua Virgine in Urbem revocanda, Lugduni, apud Seb. Gryphium, 1547.

Enarrationum in Psalmos pars prima, Lugduni, apud Seb. Gryphium, 1548.

Enarrationes in Librum Iob, Venetiis, apud Cominum, 1567.

(List from Crociata 1987: 241–242).

Impact and Legacy

Steuco's greatest philosophical contribution is in his work *De perenni philosophia*. In the seventeenth century, the book was highly praised: Kasper von Barth (1587–1658) called it a “golden book,” and Daniel Georg Morhof (1639–1691) referred to it as an “opus admirabile” (Schmitt 1966: 516–517). However, the work also had many critical readers: Benito Pereira (1535–1610), Giambattista Crispo (1550–ca. 1595), Denis Petau (1583–1652), Gerardus Johannes Vossius (1577–1649), Richard Simon (1638–1712), and Johannes Matthaeus Gesner (1691–1761).

According to Pereira, Steuco's positions were “not only false, but even most absurd and completely inconsistent with Christian teaching” (Schmitt 1966: 525). Giambattista Crispo, a little-known Italian thinker from Gallipoli, in his *De ethnicis caute legendis* (1594), “criticized “that celebrated writer on perennial philosophy” (*celebrem illum de perenni philosophia scriptorem*) for comparing Moses to Plato,

describing it as “Steuco's odious comparison” (*odiosa Eugubini comparatio*)” (Schmitt 1966: 526). Petau, following Pereira's objections, asserted that the agreement of Platonism with Christian tradition was theologically unacceptable. The theologian and philologist Johannes Vossius condemned Steuco's idea that the ancient pagan religions were in profound agreement with Christianity: “he charges Steuco with twisting Plato's words to make them agree with Christian teaching. Vossius can see no connection between the teachings of the *prisci theologi* and Christianity, and concludes that no one who knows Plato well could agree with Steuco's interpretation” (Schmitt 1966: 527). Richard Simon criticized Steuco's excessive dependency on the *prisca theologia* and his misinterpretations. Finally, Gesner “found Steuco, along with Psellus and Ficino, to have erroneously held that religious truths may be known without actual access to the Scriptures” (Schmitt 1966: 527).

Conversely, in the syncretistic branch of the sixteenth century, Steuco's work met the favor of many interpreters. For example, Guillaume Postel (1510–1581) mentioned *De perenni philosophia* in his *De rationibus Spiritus Sancti* (1543). Julius Caesar Scaliger (1484–1558), in the prefatory letter to his translation of *Libri de plantis falso Aristoteli attributi* (1556), called Steuco “a divine man and easily a prince of true literature” (Schmitt 1966: 528). Jacques Charpentier (1524–1574) in *Platonis cum Aristotele in universa philosophia comparatio* (1573), because he “was looking for material in support of his own view that Platonism and Christianity are reconcilable, cited evidence from Steuco that such an end can be accomplished” (Schmitt 1966: 528). Paul Scalichius (1534–1574) in *De iustitia aeterna seu de vera promissione gradatio* (1559) and Muzio Pansa (1560–1640) in *De osculo seu consensu ethnicae et Christianae philosophiae tractatus* (1605) were profoundly influenced by Steuco's philosophical thought. In particular, “Pansa's work in essentially an early eighteenth-century reiteration of the principles of perennial philosophy” (Schmitt 1966: 529).

Lastly, in this long historical tradition, we get to Gottfried Wilhelm Leibniz (1646–1716). As Charles B. Schmitt claims in his fundamental

essay entitled “Perennial Philosophy: From Agostino Steuco to Leibniz” (1966), that “Leibniz knew Steuco well [...] and traces of his influence can be found throughout Leibniz’s writings” (Schmitt 1966: 531). Nevertheless, he “was not the originator of the notion of *philosophia perennis*” and “was the first to speak of *philosophia perennis* without specifically referring to Steuco as the author of the notion. [...] From this time onward the connection of ‘perennial philosophy’ with the theologian from Gubbio was often lost” (Schmitt 1966: 532).

- philosophy, based on their reading of Cicero and Seneca. Seneca attracted much humanist attention and was the subject of biographies and commentaries. However Stoicism also had its critics, from Lorenzo Valla, adopting an Epicurean point of view, to Marsilio Ficino, defending his own Platonic position. The recovery and translation of Greek authors such as Diogenes Laertius and Epictetus expanded knowledge of the Stoa. Whereas early humanists associated Stoicism with Cicero and Seneca, later generations returned Zeno and Chrysippus to center stage. Seneca remained important, even after the correspondence with St Paul was dismissed as spurious, and attracted the attention of Erasmus, Jean Calvin, and Justus Lipsius. It was with Lipsius that the fortunes of Stoicism changed dramatically. His *De constantia* founded what has come to be called Neostoicism, while his two Stoic handbooks published in 1604 brought together for the first time more or less all the surviving evidence for Stoic philosophy. His contemporaries Michel de Montaigne and Guillaume Du Vair presented Stoic ideas in the vernacular and reemphasized the practical orientation of Stoicism. The early seventeenth century saw a flurry of scholarly studies by Adam Bursius, Caspar Scioppius, and Isaac Casaubon alongside those of Lipsius. Throughout the period, a continual theme was the compatibility of Stoicism with Christianity; by the end of the period, they were firmly disconnected, paving the way for eighteenth-century presentations of Stoicism as a form of materialism and atheism.

Stoicism

John Sellars
Department of Philosophy, King’s College
London, London, UK

Abstract

The ancient philosophy of Stoicism found both admirers and critics during the Renaissance. Early humanists such as Petrarch and Coluccio Salutati admired many aspects of Stoic

Introduction

The ancient philosophical school of Stoicism was founded in Athens by Zeno of Citium c. 300 BCE, and the school developed under his successors Cleanthes and Chrysippus. By the first century BCE, the Athenian school was no more, but its ideas were already well known in Rome. The works of the Athenian Stoics fell out of circulation in late antiquity, making Cicero’s extended

discussions of Stoic ideas in his philosophical works the earliest and most important record of early Stoic philosophy.

In Rome Stoicism attracted numerous adherents, of whom Seneca was probably the most significant, along with a number of others with whom he was acquainted, including Cornutus, Lucan, and Persius. Around the same time, Musonius Rufus lectured on Stoicism in Rome, and his most famous pupil, Epictetus, went on to found a philosophical school in Nicopolis, where his pupil Arrian recorded his lectures. Epictetus was an important influence on Marcus Aurelius, whose notebook reflections composed most likely in the 170s stand as the latest Stoic text to survive.

The Stoics identified God with Nature (or with the *pneuma* permeating Nature) and God's providence with fate, which they characterized as the order of causes in Nature. The human soul, they suggested, is a fragment of the divine *pneuma* in Nature and essentially rational. They dismissed the emotions of delight, lust, distress, and fear as the products of mistaken judgments and taught their eradication. They advocated a life in harmony with Nature guided by virtue, which they defined as a soul in excellent condition. Only virtue is inherently good, they held, and its opposite, vice, the only thing inherently bad. External goods and states of affairs may be preferable or non-preferable depending on whether they contribute to one's self-preservation, but they cannot contribute to one's happiness, for which virtue is the only necessary and sufficient condition.

Heritage and Rupture with the Tradition

In the Latin West Stoic ideas were known primarily via the works of Cicero, Seneca, and Church Fathers such as Lactantius, Jerome, and Augustine. Further sources of information included Boethius, Calcidius, and Aulus Gellius. In the twelfth century, before the explosion of interest in Aristotle in the thirteenth, philosophers such as Peter Abelard and John of Salisbury engaged with Stoic ideas drawn from these sources. Although in principle it would have been possible to recover Stoic ideas on a fairly wide range of philosophical

topics, in practice the focus tended to remain in the realm of ethics. The most noteworthy examples of philosophers engaging seriously with Stoic ethical ideas were Peter Abelard (in his *Collationes*) and Roger Bacon (in his *Moralis philosophia*). In both cases Seneca and Cicero were unsurprisingly the main sources of information and inspiration.

Renaissance engagements with Stoicism continued in this vein, at least at the beginning. It would be some time before the full range of ancient evidence for Stoic ideas became readily available, and not until the sixteenth century that the most important Greek sources were put into print. Although the important account of Stoic doctrine in Book VII of Diogenes Laertius's *Vitae philosophorum* had been translated into Latin c. 1433 and first printed in 1472, the Greek text did not appear in print until 1529. Similarly, the *Enchiridion* of Epictetus was translated into Latin in 1450 and 1479 and first printed in 1497, but the Greek text did not appear in print until 1529. Arrian's *Dissertationes Epicteti*, upon which the *Enchiridion* was based, was first printed in 1535, and Marcus Aurelius's notes to himself were printed in 1559. Other key sources in Greek included material contained in works by Stobaeus, Plutarch, Philo, Sextus Empiricus, Galen, and the Greek commentators on Aristotle (in particular, Alexander of Aphrodisias and Simplicius).

Debates about the compatibility of Stoic ethics with Christian teaching, as well as about Seneca's relationship with Christianity (shaped by Jerome's assessment of him and his supposed correspondence with St Paul), continued well into the sixteenth century. Those debates culminated in Justus Lipsius's attempt to reconcile Stoic and Christian teaching in his *De constantia* of 1584. The gradually increasing body of knowledge about ancient Stoicism was also transformed by Lipsius when he drew it all together for his two sourcebooks of Stoic philosophy printed in 1604. Lipsius's scholarship marks a definite rupture with the medieval and early Renaissance reception of Stoicism. Later discussions of Stoicism by authors such as G. W. F. Leibniz and Pierre Bayle would not have been possible without the work of

Lipsius, upon which they relied for their knowledge of Stoicism as a philosophical system.

Innovative Aspects

The early Renaissance interest in ancient Latin texts brought renewed attention to Stoicism. The most important early figure was Petrarch (Francesco Petrarca, 1304–1374). Petrarch's knowledge of Stoicism was a little different from that of his medieval predecessors and was drawn mainly from Seneca and Cicero. If there was a difference, it was in his approach to the material. His particular interest in Roman antiquity and his practical philosophical outlook combined to make him take these authors far more seriously than most scholastic philosophers tended to do. In *De sui ipsius et multorum ignorantia*, Petrarch dismissed Aristotle's *Nicomachean Ethics* as a dry textbook of moral theory, admiring instead Cicero, Seneca, and Horace for their inspiring ethical maxims (Petrarch 2003, 315). His broadly Socratic approach to philosophy, seeing it as the art of living well, made him especially interested in the sorts of Stoic therapeutic practice found in works such as Seneca's *Epistulae* and Cicero's *Tusculanae disputationes*. This is most evident in his largest philosophical work, *De remediis utriusque fortunae* (Petrarch 1554, 1991), written in the 1350s. In this text, he offers a series of remedies for both good and bad fortune: in Book I "Reason" (*Ratio*) debates with "Joy" (*Gaudium*) and "Hope" (*Spes*) in order to temper happiness with or desire for a whole series of apparent goods, from good health to fame after death, while in Book II "Reason" debates with "Sorrow" (*Dolor*) and "Fear" (*Metus*) about the apparent evil of things such as ill health, poverty, bereavement, and death. These four categories of emotion which "Reason" tries to subdue are taken from Cicero's account of the Stoic analysis of emotions in *Tusculanae disputationes* III.24–5 where delight (*laetitia*) and lust (*libido*) are defined as a belief in something good, either present or future, and distress (*aegritudo*) and fear (*metus*) are defined as a belief in something bad, either present or future. The dialogue form into which this Stoic

division is cast was, like the title of the work, inspired by a short treatise entitled *De remediis fortuitorum* which was thought to be by Seneca (but is now dismissed as spurious). While the content of Petrarch's various remedies draws on a wide range of sources, the overall structure and aim are firmly Stoic (see further Panizza 1991).

The influence of Stoicism can also be seen in Petrarch's *Secretum*, written in 1347. In this dialogue between Augustine ("Augustinus") and Petrarch himself ("Franciscus"), Augustine takes the role of an older and wiser teacher who offers Petrarch a Christianized brand of Stoic-inspired psychotherapy. He argues that the younger Petrarch's current unhappiness is ultimately his own fault but that it is also within his own power to escape from it. Augustine states that "virtue alone makes the mind happy" (*Secretum* I.3.1; Petrarch 2016, 16–17), and so we should not be disturbed by external events and objects, echoing fairly standard Stoic doctrine. He goes on to suggest that only a Stoic life in accord with reason will cure the young Petrarch of his current distress. Once again Petrarch the author draws on Cicero's *Tusculanae disputationes* III.24–5 for the ensuing Stoic analysis of the emotions, which are presented as the principal impediment to a rational life.

Given that Augustine is the central character in the dialogue, reflecting his place as the preeminent influence on Petrarch, the discussion also includes a number of non-Stoic doctrines, where Petrarch carefully Christianizes his Stoicism: the soul, for instance, is said to be contaminated by the body (*Secretum* I.15.1; Petrarch 2016, 56–7) and must escape its grossness in order to ascend to heaven (*Secretum* I.8.3; Petrarch 2016, 34–5). The young Petrarch alludes to Augustine's own doctrine of grace, claiming that he can hope for nothing from himself, only from God. While Augustine acknowledges the role of grace, he continues to insist that Petrarch's troubles remain entirely within his own control (*Secretum* II.1.1; Petrarch 2016, 64–5). However, the final conclusion of the work owes more to Augustinianism than it does to Stoicism: the way for Petrarch to overcome his love for a woman (Laura) is ultimately not through Stoic rational psychotherapy but rather

by replacing that passion with a healthier one, namely, the love of God (*Secretum* III.5.2; Petrarch 2016, 166–7).

In both *De remediis utriusque fortunae* and *Secretum* Petrarch drew heavily on Cicero; he was also an avid reader of Seneca. He admired Seneca's writings but had doubts about the man, brought on in part by reading Suetonius's life of Nero. In his letter addressed to Seneca (*Familiares* XXIV.5; Petrarch 2005, III:322–5), written in 1348, Petrarch praised Seneca as the greatest moral philosopher and claimed to read him every day. However he also questioned Seneca about his relationship with Nero and what Petrarch took to be various errors in judgment. Petrarch was disturbed by this mismatch between Seneca's philosophy and his life, which, in the hands of harsher critics, might have been seen as hypocrisy (see further Ker 2009, 314–17).

While Petrarch's works drew widely on the Latin sources for Stoicism available to him, he did not attempt to defend or champion Stoicism directly. By contrast, his contemporary and sometime Greek teacher Barlaam of Seminara (c. 1290–1348) wrote a short text outlining Stoic ethics and explicitly defending it from Peripatetic criticisms. Barlaam's *Ethica secundum Stoicos* (Hogg 1997) can probably lay claim to being the earliest surviving example of Stoic scholarship. In it, Barlaam claims to draw on a wide range of Stoic sources, although he does not name them.

The work is divided into two books. Book I responds to the question “what is happiness?” and locates it in virtue and virtuous actions, arguing against the Peripatetic view that happiness requires other things beyond virtue. Book II asks the question “in what things does happiness consist?” and argues that it consists in having one's soul in a good condition, free from emotional disturbances. Here Barlaam argues against the Peripatetic doctrine of the moderation of emotions. It is within this context that he outlines a distinction between different degrees of emotional disturbance that may record an element of Stoic doctrine otherwise unknown (Hogg 1997, 9). It is possible that he may have had access to Stoic material now lost during his time in Constantinople. The ideal state of mind is constancy

(*constantia*). This requires three things: true judgment about goods and evils, mental equability, and a beneficent will (*Ethica* II.5; Hogg 1997, 116). The worst possible state of mind happens when their three opposites are present: false judgment, mental darkness, and a maleficent will (*Ethica* II.7; Hogg 1997, 117). In between these extreme states, there are six further grades of emotional disturbance, formed by different combinations of the absence or presence of these three factors. Immediately after presenting this otherwise unknown material, Barlaam then presents the well-known account of four types of emotional disturbance recounted in Cicero (outlined earlier) and explains how these two accounts fit together. Barlaam's treatise is relatively unknown but stands as one of the few technical discussions of Stoic ethical theory from this period.

A complex set of relationships with Stoicism can be found when turning to Coluccio Salutati (1331–1406), a key figure in the development of Florentine humanism. Early in his intellectual development, Salutati adopted a broadly Stoic position inspired by his reading of Seneca. He knew both the prose works and the tragedies but thought they were the work of two different authors (*Epistolario* III.8; Salutati 1891–1911, I:150–55). In his letters, he commended a range of broadly Stoic ideas, even if he did not always mention the Stoics by name (Witt 1983, 63–5). In his most substantial work, *De laboribus Herculis*, inspired by Seneca's *Hercules Furens*, Salutati openly championed Stoicism above all the other ancient philosophical schools for coming closest to true virtue (Salutati 1951, 1:311). Elsewhere he defines nobility as the product of virtue rather than high birth (Ullman 1963, 73), implicitly endorsing the Stoic claim that true goodness comes only from virtue and echoing the famous Stoic paradoxes discussed by Cicero.

Yet he was also sensitive to the need to qualify his admiration for Stoicism in the light of Christian teaching. Like Barlaam, Salutati identified the distinctively human good as a life guided by virtue. However, unlike Barlaam, he denied that this was completely within one's control, suggesting in a letter of 1369 that a good life required not only virtue but also the grace of God (*Epistolario* II.18;

Salutati 1891–1911, I:110). This moderate, Christianized brand of Stoicism echoes the views of Petrarch, with whom Salutati corresponded in the same year.

Later in life Salutati became critical of Stoicism, openly acknowledging the shift from his earlier views. After the death of his son in 1400, a well-meaning correspondent, Francesco Zabarella, sent a letter of consolation based on the Stoic principles which Salutati himself had previously embraced. But in the wake of bereavement, he no longer found these arguments convincing and responded with a lengthy attack on this attempt at Stoic consolation (*Epistolario* XII.4; Salutati 1891–1911, III:456–79; Kraye 1997, 179–91). He challenged the claim that because only virtue is good and vice is evil, death is not an evil. Although morally death is not evil, it remains a genuine evil because it is the privation of the goodness of life. Salutati draws on Aristotle for support, calling him “the prince of philosophers,” while castigating the “cold-heartedness and unattainable logic of the Stoics” (Salutati 1891–1911, III:463; Kraye 1997, 182). The various forms of Stoic philosophical consolation reported by Cicero do nothing to soothe the mind; only the passage of time can heal it. Salutati’s firsthand experiences of grief had taught him some hard lessons. His dismissal of Stoicism in this late letter appears to have been an attack primarily on the sort of Stoic therapeutics outlined by Cicero in the *Tusculanae disputationes*. Cicero was himself skeptical of the efficacy of the cold and technical way in which the early Stoics presented their views (*Tusculanae disputationes* IV.9; *De finibus* IV.7). Salutati’s earlier enthusiasm for Stoicism, by contrast, relied more on the rhetorical presentation of their ideas in Seneca, whom he had often praised as the greatest of moral philosophers (e.g., *Epistolaria* II.2; Salutati 1891–1911, I:57, cf. Ullman 1963, 87).

In his admiration for Seneca, Salutati was by no means alone. Seneca’s reputation during the Middle Ages and early Renaissance was shaped in large part by Jerome’s judgment in his *De viris illustribus*, which was often reproduced in manuscripts containing Seneca’s works (Ker 2009,

182). Although brief, Jerome’s remarks implicitly affirm the authenticity of the correspondence between Seneca and St Paul and comment on the virtuous character of Seneca’s moderate life (*continentissimae vitae fuit*). Interest in Seneca’s life increased in the wake of Boccaccio’s discovery at Monte Cassino of a manuscript preserving the *Annales* of Tacitus; if Jerome had described Seneca as a pagan equivalent of St Paul, Tacitus presented his death as a heroic martyrdom on a par with that of Socrates. Boccaccio drew on both of these accounts in his commentary on Dante’s *Divina Commedia*, written in 1373–1374. There, Dante had placed Seneca in Limbo as an unbaptized pagan (*Inferno* IV.141). Boccaccio tried to rescue Seneca from this fate by arguing that the correspondence with St Paul suggested that the apostle saw Seneca as a Christian and that Jerome confirmed this judgment. The newly discovered testimony of Tacitus showed that Seneca’s death was not really suicide but an execution ordered by Nero, although one carried out by Seneca’s own hands. Not only that, the pool in which Seneca opened his veins became, on Boccaccio’s reading, a baptismal font in which Seneca was baptized before his death (Boccaccio 2009, 234–5). Thus, Seneca could be saved. A number of writers elaborated on these matters and wrote their own lives of Seneca, the most important of whom were Gasparino Barzizza, Siculo Polenton, Giannozzo Manetti, and Paolo Pompilio (Panizza 1977, 317; see further Panizza 1984).

The earliest of these, Gasparino Barzizza (1360–1431), wrote not only a biography of Seneca but also a commentary on the *Epistulae morales* and on the correspondence with St Paul. Although his commentaries on Seneca never made it into print, his biography was often included in fifteenth- and sixteenth-century editions of Seneca’s works, although shortened and either anonymously or mistakenly attributed to Polenton (Panizza 1977, 337). These works were the by-product of lecturing on Seneca at the University of Padua, sometime between 1407 and 1421. In his biography of the Stoic, Barzizza followed Boccaccio in claiming that Seneca was baptized moments before death but then went one step further by claiming that the mixture of

Seneca's own blood with the water constituted baptism by blood, i.e., martyrdom (Panizza 1977, 323–4). In the introduction to his commentary on the *Epistulae morales*, he praises Seneca as preeminent among ancient philosophers for guidance about how to put theory into practice (Barzizza 1977b, 352), comparing him with Socrates. Seneca's moral philosophy offers both medicine for the soul and spiritual guidance which is second to that of no other ancient author (Barzizza 1977b, 352–3). Indeed, Seneca's preeminence above all other Greek and Latin authors is precisely because his philosophy is focused on practical questions about how to live well (Barzizza 1977a, 349). Toward the end of his career, Barzizza shifted his attention to Cicero at the expense of Seneca, but this did not indicate a turn away from Stoicism conceived as a practical guide to life. Among other Ciceronian works, he lectured and wrote on *De officiis* and presented Cicero as a Stoic (Panizza 1977, 303–4).

In the case of Giannozzo Manetti (1396–1459), we find a life of Seneca paired with a life of Socrates, explicitly modeled on Plutarch's parallel Greek and Roman lives (Manetti 2003, 166–7). For Manetti, Seneca is the prince of Latin philosophers (Manetti 2003, 164–5) and the greatest moral philosopher (Manetti 2003, 244–5). He was a friend of St Paul and the author of not only those works now attributed to Seneca but also a range of other writings since judged to be spurious (such as the *De quattuor virtutibus*, by Martin of Braga), as well as the rhetorical works by Seneca's father. Manetti drew on a wide range of pagan and Christian authors for his biography, from Plutarch and Tacitus to Lactantius, Jerome, and Augustine. He explicitly presents Seneca as a Stoic, whose views he champions over those of the other philosophical schools, and he even suggests that Seneca was the master and leader (*magister et princeps*) of the Stoics (Manetti 2003, 266–7). Manetti also defended Seneca against criticisms of his behavior, such as his great wealth, by showing that possession of a mere “indifferent” does not contradict Stoic doctrine (Manetti 2003, 270–1). This focus on the practical value of Seneca's philosophy alongside sustained defenses of his actions by

Barzizza, Manetti, and others highlights the way in which many of those drawn to Stoicism in this period approached it, not as an abstract theoretical system but rather as a philosophical way of life. However, elsewhere Manetti was skeptical about the benefits of Stoic consolation (McClure 1991, 100–3).

Seneca's fortunes were to change, however, in the wake of the much closer attention paid to his texts. For humanists such as Petrarch, Salutati, and Manetti, the name “Seneca” was associated with a collection of moral essays and letters, a whole series of shorter pieces including the correspondence with St Paul, rhetorical works, and a collection of tragedies. While some thought the moralist and the tragedian were different people, it was some time before the rhetorical works were identified as the work of Seneca's father. Central in all this was inevitably the question of the authenticity of the correspondence with St Paul. The first person to challenge its status was Leonello d'Este in the 1440s, probably inspired by the humanist Guarino Veronese. He may have been preempted by Lorenzo Valla in a now lost work written in the 1420s (Panizza 1977, 334–6).

Valla himself had little time for Stoicism. In his dialogue *De voluptate* (first completed in 1431, expanded as *De vero bono* in 1433, and eventually re-titled *De vero falsoque bono*), he compared Stoic and Epicurean views regarding pleasure and virtue. Ultimately Valla opted for a Christianized form of hedonism, but along the way he outlined and criticized the Stoic position. Despite claiming to follow Nature, the Stoics attempted to reform it, by trying to overcome our completely natural emotions (Valla 1977, 72–3). Moreover, their remedies against misfortune fail to help. The antidote to grief is not resignation but rather a healthy dose of its opposites: delight, pleasure, and cheerfulness (Valla 1977, 140–1). Stoic virtue does not cultivate happiness; instead, like the head of Medusa, it turns people into marble. For Valla, pleasure and suffering are necessary parts of a human life, and Stoicism fails to accept this basic fact. Elsewhere, in his *Retractatio totius dialecticae*, Valla describes Stoic doctrine in terms that might commend it to a Christian reader: the sect held that the world was made by

God for the sake of men and that human souls survive after death (Valla 2012 I:100–3). Both of these claims involve a partial reading of the ancient evidence, to say the least, and for Valla merely show that some of the time some pagan philosophers get some things right.

The humanist Poggio Bracciolini (1380–1459) is remembered for his long-running literary dispute with Valla. He also disagreed with Valla about the value of Stoicism. In his dialogue *De vera nobilitate*, composed around 1440, he has his friend Niccolò Niccoli champion the Stoic claim that true nobility derives from virtue rather than external goods (§69; Poggio 2002, 30). Stoic themes also appear in Poggio's *De varietate fortunae* (1447) and *De miseria humanae conditionis* (1455). His friend, Leon Battista Alberti (1404–1472), grappled with similar topics in his own dialogues, especially the way in which virtue might offer some kind of protection against the vicissitudes of fortune (Kircher 2012, 111–64). In this, both Poggio and Alberti followed Petrarch in turning to Stoicism and, in particular, Seneca for philosophical consolation (on Alberti see further Schöndube 2011).

Seneca was not the only Stoic whose works survived the end of antiquity. The gradual process of rediscovering Greek texts during this period brought to light a work by another Roman Stoic: the *Enchiridion* of Epictetus. This short text was translated into Latin by Niccolò Perotti (1429–1480), probably in 1450, and again later by Angelo Poliziano (1454–1494) in 1479. In both cases Epictetus was read in the light of the Neoplatonic commentary on the *Enchiridion* by Simplicius of Cilicia. Perotti translated the preface of Simplicius's commentary alongside the *Enchiridion* and may have intended to translate the entire commentary by papal commission (Oliver 1954, 25). Poliziano made use of the commentary to supplement his defective Greek manuscripts of the *Enchiridion* and had significant recourse to it when interpreting the text as well. In both his dedicatory letter to Lorenzo de' Medici and a letter in defense of Epictetus written to Bartolomeo Scala, Poliziano follows Simplicius in making a connection between Epictetus's *Enchiridion* and Plato's *First Alcibiades*. One of

Scala's criticisms of Epictetus and other Stoics, repeated in his *Dialogus de consolatione*, was that they denied the value of the body (Scala 2008, 94–5). Rather than challenge this claim, Poliziano follows Simplicius in arguing that, like Plato, Epictetus held that a human being essentially consists of a rational soul and that the body is merely an instrument of the soul. Poliziano goes on to draw a number of other parallels with Platonic doctrines concluding that although Epictetus does not state these himself, the *Enchiridion* takes them all as given. Throughout the letter Poliziano calls Epictetus a Stoic; but the aim of the letter as a whole is to show that this Stoic is in many respects a Platonist. As he puts it, “our Stoic fights boldly, using Platonic arguments as his shield” (Garin 1952, 924; Kraye 1997, 198). In short, someone committed to Platonism can comfortably embrace the *Enchiridion*, even though its author happened to be a Stoic. While both translators admired Epictetus (Perotti calls him *nobilissimus philosophus*; Oliver 1954, 68), neither had wider interests in Stoicism.

In one respect this interest in Epictetus expanded the range of Stoic material available to readers, adding a newly translated Greek Stoic text to the familiar Latin ones. However, in another respect it did not; for Epictetus was, like Seneca, a late Roman Stoic whose works focused on practical ethical guidance. It is true that readers of Cicero could learn much about Chrysippus and the doctrines of the Hellenistic Stoa, but a fuller picture of early Stoicism would require access to a much wider range of Greek doxographical sources. One person who had access to such sources was Francesco Filelfo (1398–1481), who spent a number of years in Constantinople, became proficient in ancient Greek, and brought Greek manuscripts back to Italy. It has been suggested that his consolatory dialogue *De exilio* was modeled on Cicero's *Tusculanae disputationes* and perhaps Seneca's works of consolation (Filelfo 2013, ix). What is most striking, however, about Filelfo's work is that his Stoics are not Seneca and Cicero, but rather Zeno and Chrysippus; and the Stoic doctrines which he discusses are ones that we now associate with the Greek founders of Stoicism rather than its

later Roman exponents. Following his sources, he also tells us the titles of the works by Zeno and Chrysippus from which his quotations come. In fact, he follows his sources very closely, and a number of the passages where he discusses Stoic doctrine in detail are more or less translations of sections from Sextus Empiricus (cf. *De exilio* I.227–9 with *Adversus mathematicos* XI.190–4; *De exilio* 2.95–106 with *Adversus mathematicos* XI.22–38; *De exilio* III.23–6 with *Adversus mathematicos* XI.3–17). Filelfo supplements this heavy reliance on Sextus with material from Diogenes Laertius and Plutarch's *Moralia*.

Given that the topic of the dialogue was exile, Filelfo was especially interested in the Stoic attitude toward external circumstances. This led him to recount the Stoic theory of “indifferents” (*adiaphora*) more than once (*De exilio* II.112–13; Filelfo 2013, 260, and *De exilio* III.23–5; Filelfo 2013, 324–6). The early Stoics (*veteres Stoici*) are aligned with followers of Christ (*Christi imitatores*), both being unconcerned with material goods. The (Stoic-Christian) wise man who possesses virtue wants for nothing, and so is always serene in the face of the vicissitudes of fortune (*De exilio* III.69–70; Filelfo 2013, 362). Filelfo draws on Stoic, Cynic, and Christian praise of poverty as part of a polemic against the material excesses of the Medici.

It was relatively easy for authors like Filelfo to point to common ground between Stoic ethics and Christian teaching. It was much harder, however, to reconcile Stoic physics and metaphysics with the doctrines of the Church, a point noted by Marsilio Ficino (1433–1499) in the opening chapter of his *Theologia Platonica* (Ficino 2001–2006). Ficino's project in this work was to demonstrate, by the use of reason, the immortality of the soul, a belief that which he took to be foundational for human happiness. His broadly Neoplatonic metaphysics involved a hierarchy of five levels of being: body, quality, soul, angel, and God, with the human soul located at the center and holding nature together (*Theologia Platonica* I.1; Ficino 2001–2006, I:16–17). The ancient atomists limited themselves to belief in just the first of these levels. The Stoics and Cynics do a little better by acknowledging the existence of an active

quality or power within nature, reaching the second level, but they too fail to admit the existence of an immutable human soul (*Theologia Platonica* I.1; Ficino 2001–2006, I:14–15; cf. II:124–5). The Stoic soul, immanent within matter, is subject to division and change and as such is irredeemably corrupted (*Theologia Platonica* I.3; Ficino 2001–2006, I:28–9). The Stoics also identify this soul within nature with God, a claim that Ficino rejects because it makes God dependent on the matter that he supposedly permeates (*Theologia Platonica* IV.1; Ficino 2001–2006, I:258–9). Although Ficino's remarks on Stoicism are brief, they are important because they form one of the first attempts to articulate the fundamental incompatibility between Stoic and Platonic-Christian metaphysics.

Ficino's Platonist attempt to demonstrate the immortality of the soul on rational grounds was challenged a few decades later by the Aristotelian Pietro Pomponazzi (1462–1525), who argued in his *De immortalitate animae* that it was impossible to offer such proof. Although Pomponazzi was a committed Aristotelian, he also made use of Stoic arguments. In response to the concern that denial of the immortality of the soul would remove the possibility of postmortem punishment and so undermine virtuous behavior, he argued along Stoic lines that virtue is its own reward and vice its own punishment (*De immortalitate animae* 14; Pomponazzi 2012, 180–1). He also pointed to Seneca as an example of someone who held the soul to be mortal while remaining morally upright, motivated by the Stoic doctrine that “virtue alone is happiness, and vice misery,” and pursuing only those external goods which serve virtue, while avoiding those which hinder it (*De immortalitate animae* 14; Pomponazzi 2012, 202–5). In a later work Pomponazzi was more explicit, stating that there is nothing disadvantageous to agreeing with the Stoics that the soul is mortal (Pomponazzi 2004, II:892–5).

The contrast between the views of Ficino and Pomponazzi is worth underlining and offers a window into wider debates about Stoicism both then and since. For Ficino, Stoicism is compromised by its metaphysics because human happiness ultimately depends on the existence of

an immortal soul. For Pomponazzi, by contrast, Stoic ethics stands autonomously and remains attractive independent of one's view about the nature of the soul. Not only that, the fact that it is possible to combine this with belief in the mortality of the soul shows that Stoic materialism and other positions like it ought not to be rejected simply on moral grounds. On this Pomponazzi prefigures later debates about the possibility of a virtuous atheist. With regard to Stoicism, both philosophers present opening positions in what was to become a long-running debate about the interdependence of ethics and physics in the Stoic system.

Elsewhere Pomponazzi himself engaged with other parts of the system. In his *De fato, de libero arbitrio et de praedestinatione* (published posthumously in 1567), he defended Stoic determinism against the criticisms of the ancient Peripatetic Alexander of Aphrodisias, arguing that the Stoic theory was more consistent and coherent than either the Aristotelian position or the Christian doctrine of divine providence (Pomponazzi 2004, 1:414–17; with Kraye 2016). His use of material from a Greek Aristotelian commentator like Alexander (even though in a Latin translation by Gerolamo Bagolino, 1516) marked a step forward in the recovery of ancient sources of information about Stoic doctrine.

Despite these small advances, in the early sixteenth century, Seneca remained the most famous of the Stoics and a key point of reference. Works of his had already been printed over 70 times by 1501 (Goff 1964: 555–8). A number of figures engaged with his works in various ways, producing editions and writing commentaries. The most important of these were Erasmus, Calvin, and Lipsius, although Celio Secondo Curione and Marc-Antoine Muret might also be noted.

Desiderius Erasmus (c. 1467–1536) edited Seneca's works twice, in 1515 and 1529. Unhappy with his work the first time around (or, to be more precise, the work of his collaborator), he decided to prepare a second edition (Erasmus 1906–1958, VIII:26–7). This did not, however, indicate unconditional admiration for his subject. Although he was drawn to Seneca by the value he placed on Jerome's endorsement (Erasmus

1906–1958, II:53), Erasmus had no desire to save Seneca in the way that Boccaccio and Barzizza had tried to do. Seneca was not a Christian and ought not to be read as if he were one. Notwithstanding Jerome's view, Erasmus rejected the authenticity of the correspondence with St Paul, based in part on a stylistic comparison with Seneca's other works. It was still included in both of his editions of Seneca but with a preface discussing its dubious status added in 1529 (Erasmus 1906–1958, VIII:40–1). The earlier Renaissance image of a Christianized Seneca was no longer tenable, and this inevitably had an impact on the wider reception of Stoicism.

In his own works, Erasmus had no qualms about criticizing Stoic doctrine and the idealized image of the Stoic sage. In *Praise of Folly* (written in 1509, publ. 1511), for instance, he ridiculed the Stoic's negative attitude toward the emotions, suggesting instead that emotions can act as guides and incentives to morally good behavior. The image of the Stoic sage is “a kind of marble statue of a man, devoid of sense and any sort of human feeling” (Erasmus 1979, 106). Although there remained valuable moral guidance in the works of a Stoic like Seneca, it was important to reject those doctrines which conflicted with Christian teaching. Erasmus's contribution to the reception of Stoicism in this period was effectively to unpick the attempts by some Italian humanists to smooth over the differences between Stoic and Christian thought. This formed an important step forward toward the recovery of ancient Stoicism on its own terms.

A similar move can be seen in the work of Jean Calvin (1509–1564), although this time more concerned with Stoic physics rather than its ethics. Calvin's intellectual career began with an edition of and commentary on Seneca's *De clementia*, published in 1532. In his preface, he defended both Seneca's style and his philosophy from his recent critics. In the realm of ethics, Seneca reigns supreme (*potissimum regnat*); in Roman philosophy and literature, he stands second only to Cicero; and reading his works gives one both profit and delight (Calvin 1969, 10–13). However, Calvin's most important engagements with Stoicism came later, and the topic of Stoic fate

preoccupied him throughout his subsequent works. In particular, he repeatedly distanced his own view of divine providence from the Stoic position in order to undermine the charge that he himself was a Stoic. Calvin argued in the *Institutio Christianae religionis* that his own doctrine differed from Stoicism in that he did not share the Stoic view that there existed a necessity in nature connecting all things (Calvin 1539, 265). Instead he insisted that God was master of all natural events. In fact, this view differed little from Seneca's own position (cf. *De beneficiis* VI.23.1), especially as interpreted by Augustine (in *De civitate Dei* V.8). This is especially clear in his *De aeterna Dei praedestinatione* of 1552, where Calvin repeats the view of Seneca that God "always wills the same thing, and this is the praise of his constancy" (Calvin 1552, 934). His repeated polemics against Stoic fate were necessary precisely because his own position was so close to theirs (although on other topics, such as the emotions, he was more critical; see, e.g., *Institutio Christianae religionis* III.8.9; Calvin 1961, 708–11). His argument was not so much with Stoicism as it was with a contemporary image of the Stoics which downplayed their commitment to divine providence. Either way, Calvin's contribution to these debates about Stoic physics and theology, focused on precise differences between Stoicism and various forms of Christian doctrine, marked another step toward grasping Stoicism on its own terms.

These debates about the relationship between Stoicism and Christianity and about the precise nature of Stoic fate were to become important themes in the work of Justus Lipsius (1547–1606). Like Erasmus and Calvin, Lipsius is also remembered for his editorial work on Seneca. In his case, however, it came at the very end of his career and stood as a final monument to a long-standing fascination with Stoicism. Lipsius was one of the few people during the Renaissance (or any other period since antiquity) to identify himself openly as a Stoic. Yet he also remained a Christian and grappled with the ongoing issue of the extent to which the two worldviews might be reconciled. He first tackled this in his *De constantia*, published in 1584. This consolatory

dialogue drew on Stoic material to offer remedies for emotional disturbances caused by external events. It opens with the Stoic claim that human suffering is ultimately the product of our judgments rather than external events. It goes on to offer arguments against the existence of external evils: they are imposed by God; they are the product of necessity and fate; they, in fact, benefit us; and they are neither grievous nor unusual (Lipsius 1584, 38). Much of this draws inspiration from Seneca, especially the claim that apparently evil events are, in fact, good for us, which repeats a line of argument developed in Seneca's *De providentia*. The most philosophically significant part of Lipsius's dialogue is the discussion of fate, in which he both drew on and distanced himself from the Stoic theory of fate, just as Calvin had done half a century earlier. Lipsius's explicit line is that Stoic fate ought to be modified in the light of Christian doctrine before it can be embraced. The problem with the Stoic position is that it subordinates God to fate, insists on an eternal succession of natural causes, denies contingency, and inflicts a violent force on our will (Lipsius 1584, 65). However, the details of Lipsius's account suggest that he thought there was no great dispute between the Stoic and Christian views of fate and that the Stoic position could be embraced unaltered (Sellars 2014, 657–63).

Twenty years later, in 1604, Lipsius revisited the topic, and this time was unequivocal in his embrace of Stoic fate. Central to the discussion was a problematic passage in Seneca's *De providentia* (5.8) which seemed to imply that God was himself bound by fate. Drawing on other passages in Seneca, along with the authoritative judgment of Augustine, Lipsius argued that the Stoics do not subordinate God to fate; rather, fate is the expression of God's will. And if fate is inevitable even for God, it is only because his perfection means he never changes his mind (Lipsius 1604b, 31–2). Although Seneca is sometimes clumsy in the way he expresses this, there is nothing in the Stoic theory that requires modification. Any apparent conflict is, as Augustine put it, merely a verbal difference (*De civitate Dei* V.8).

This second, more decisive, discussion of Stoic fate appeared in Lipsius's *Physiologia Stoicorum*,

printed in 1604, and one of a pair of volumes devoted to Stoicism published that year. The *Physiologia Stoicorum* and its companion the *Manuductio ad Stoicam philosophiam* (Lipsius 1604a, b) were both conceived as aids to the study of Seneca, whose complete works Lipsius was editing at the same time (and published a year later in 1605). In these two volumes, he gathered together the ancient evidence for Stoicism from a wide range of Greek and Latin sources, arranged it by topic, and added his own interpretive commentary (see further Saunders 1955). It was in these two books that for the very first time a reader could access more or less all the ancient evidence for Stoicism as a philosophical system in one place. This marked a watershed in the recovery of ancient Stoicism in the Renaissance.

All of Lipsius's works were written in Latin and intended for scholars. At the same time that he was preparing these, other writers attracted to Stoicism were among the first to present Stoic ideas in the vernacular. One of the earliest of these was Michel de Montaigne (1533–1592), who was an avid reader both of works by Roman Stoics (Seneca, Epictetus) and of texts which were rich sources of information about early Stoicism (Cicero, Plutarch). His reading of Stoic material was certainly an important influence on him, but he never became an advocate of Stoicism as Lipsius had been. Even so, the impact of Stoicism can be seen throughout his *Essais*. In *Essai* I.14, for instance, he took as his theme the saying of Epictetus that people are troubled not by things but by their judgments about things (*Enchiridion* 5). He argued in support of the Stoic claim that death, pain, and poverty are not evils in themselves by appealing to the diversity of human opinion on these topics: some people embrace death or pain for the sake of a higher ideal; some people are happier without riches than they are with them, including himself. Although he briefly granted the Epicurean claim that pain is the worst thing that can happen to someone, he went on to qualify this by saying that the only reason we think this is because we overvalue the body and neglect the importance of the soul when assessing our well-being (de Montaigne 1962,

56–7). He cited with approval from Cicero's account of the Stoic theory of emotions in the *Tusculanae disputationes* (III.71) the claim that grief lies not in nature but in our opinion (de Montaigne 1962, 61). When denying the value of riches, he quoted from Seneca (*Epistulae* LXXIV.4) while also drawing on his own experience. His conclusion presented a straightforwardly Stoic view: each person's ease or indigence (*l'aisance et l'indigence*) depends on their opinion. External goods such as health, fame, and wealth only have the value we give to them. Fortune does us neither harm nor good, and it is our soul that is the only cause of our happiness or unhappiness (de Montaigne 1962, 67). Although Stoicism is never mentioned by name in his discussion, he knowingly drew on Stoic texts in order to develop his argument. However, the final arbiter for Montaigne here and elsewhere is how well something accords with his own experience. He presented Stoic ideas with approval only to the extent that they agreed with his own.

The Frenchman Guillaume du Vair (1556–1621) stood somewhere in between Lipsius and Montaigne. He shared with Lipsius a philosophical commitment to Stoicism, with Epictetus taking the place of Seneca as the major influence. Like Montaigne, he wrote in the vernacular; and he translated Epictetus's *Enchiridion* into French for the first time (1585, published 1591). His work *De la constance et consolation es calamitez publiques*, published in 1594, offered a vernacular counterpart to Lipsius's *De constantia*. In the present context, his most important work was his *Philosophie morale des Stoïques* of 1585. This work, Du Vair says in the opening letter to the reader, was his attempt to present the same material as in his translation of Epictetus but taken to pieces and rearranged in a more systematic fashion (Du Vair 1945, 61). The result is more organized but far from technical; and Du Vair runs through the central doctrines of Stoic ethics concerning the role of external goods, the emotions, and the importance of living in accordance with reason, virtue, and nature.

Modern scholars have often labeled the revival of Stoicism in this period “Neostoicism,” in order to indicate the ways in which it differs from ancient Stoicism (see, e.g., Oestreich (1982); Morford (1991); Lagrée (2010)). It is often claimed that “Neostoicism” differs from “Stoicism” by involving various amendments to Stoic doctrine intended to make it acceptable to a Christian audience. The founder of “Neostoicism,” on this account, was Lipsius. Yet, as we have seen, Christianized versions of Stoicism were commonplace well before Lipsius, and the details of his account of Stoicism are on the whole faithful to the ancient Stoa. Even so the label is well established and is often applied to Lipsius, Du Vair, and a number of others indebted to Stoicism in the late sixteenth and early seventeenth centuries (Lagrée 2010, 20–1). Among these one might mention Pierre Charron (1541–1603), Francisco de Quevedo (1580–1645), and Hugo Grotius (1583–1645). These Neostoics all drew on and adapted Stoic ideas within a broadly Christian context just as others had done in the preceding centuries. If there was a difference, it was simply a reflection of the quite different cultural contexts in which early and late Renaissance readers of Stoicism were working: late fourteenth-century Italy was not the same as early seventeenth-century Northern Europe.

Impact and Legacy

Lipsius’s Stoic handbooks were published in 1604, followed by his edition of Seneca in 1605; he died the following year. That decade also saw the publication of a number of other early works of Stoic scholarship. In Poland, Adam Bursius produced a comprehensive study of Stoic epistemology and logic in his *Dialectica Ciceronis...maxime ex Stoicorum sententia* (Bursius 1604). In it he covered topics from the definition of logic and its place in the Stoic system, through epistemology (*aisthêsis*, *katalêpsis*, *sunkatathêsis*), to modal logic and Stoic syllogisms. Although presented as a commentary on passages from Cicero, Bursius made full use of a

wide range of Greek and Latin sources in his discussion, including Diogenes Laertius, Plutarch, Galen, and the Greek commentators on Aristotle. Bursius’s volume formed a natural complement to Lipsius’s handbooks on Stoic ethics and physics published in the same year, although it was probably far less well known. In the following year, Isaac Casaubon published his celebrated edition of the Stoic poet Persius (Casaubon 1605) which included a vast commentary discussing many aspects of Stoic doctrine. Caspar Scioppius’s *Elementa philosophiae Stoicae moralis* (Scioppius 1606) was printed the year after. Scioppius, a German humanist who corresponded with Lipsius, argued for the educational benefits of Stoic moral philosophy, in an attempt to reform Catholic education and, in particular, to challenge the Jesuits’ Aristotelian curriculum. Echoing Petrarch, he contrasted Aristotelian moral theory, which merely teaches what goodness is, with Stoic practical philosophy, which trains people to become good. Stoic philosophy is not contemplative but rather, like music and medicine, is an art that must be put into practice. As such, mastery of this art will require not only the study of philosophical doctrines but also mental exercises (Scioppius 1606, 18r). He also claimed that Stoicism was, in fact, more compatible than Aristotelian doctrine with Christianity. For these reasons, Stoicism ought to be preferred over Aristotle when looking for a foundation for a moral education (see further Krayer 2008). Just a few years later, Daniel Heinsius praised Stoicism in his oration “De Stoica philosophia” (Heinsius 1612, 131–92). This text was not really a contribution to Stoic scholarship but rather simply an exhortation to Stoic wisdom. Nevertheless, it reflected the increased interest in Stoicism at the beginning of the seventeenth century (Santinello 1993, 131). By this time, then, all the relevant Greek and Latin sources for Stoicism were available in print, and there was a small but expanding body of secondary literature offering readers a guide through the intricacies of the Stoic system. At the same time, the popularity of works by Lipsius, Du Vair, and Montaigne continued to

remind readers that Stoicism also offered very practical guidance about how to live.

The most important legacy of the Renaissance interest in and recovery of Stoicism was the confirmation that Stoic philosophy and Christian doctrine were ultimately incompatible. The foundations for this were laid by philological work on the texts of Seneca by many hands, eventually separating Seneca from his father, identifying the moralist with the tragedian, and dismissing a whole range of minor works as spurious. Most important was the rejection of the supposed correspondence between Seneca and St Paul. The recovery of ancient biographical accounts of Seneca which were not always flattering challenged the medieval image of Seneca as a proto-Christian saint. The matter was finally brought to a head, however, by a shift in focus from the later Roman Stoic moralists to the doctrines of the Athenian Stoics Zeno and Chrysippus. With all the available evidence more or less to hand, increasingly sifted and sorted, it became clear to readers that despite all the talk of God and providence, the Athenian Stoics were, like their contemporaries the Epicureans, materialists. When they spoke of God, they simply meant Nature. Although they talked about providence, this was simply another name for mechanical fate. As the seventeenth century progressed, “Stoic” became a term of abuse used against philosophers such as Thomas Hobbes (by Bramhall; see Bramhall and Hobbes 1656, 195) and Spinoza (by Vico 1744, 1:116). Earlier concerns also persisted: philosophers drawing on the Augustinian tradition such as Blaise Pascal and Nicolas Malebranche were highly critical of Stoicism, attacking Epictetus and Seneca respectively for claiming that human happiness is within the power of the individual, without the grace of God. By the eighteenth century, Stoicism had become a form of atheism (Brooke 2012, 127–48) and an example of modern paganism (Gay 1966, 295–304). The great Enlightenment *philosophe* Denis Diderot admired both Seneca for his pagan virtue and Stoicism for its materialism and atheism. All of this would have been impossible without the philological labors and

philosophical debates that took place during the Renaissance.

Università di Pisa, Pisa, Italy

The Warburg Institute, University of London, London, UK

Abstract

Francesco Storella was born in Alessano in around 1529. Close adherence to the text, exegesis, and criticism were the characteristic features of Storella's philosophical research, which was animated by a constant polemic against Girolamo Balduino. His works insist greatly on the importance of recovering the classical world through direct, unmediated study of Greek and Latin texts. His thought is permeated by a certain eclecticism, with references to aspects from Plato, Averroes, Duns Scotus, and William of Ockham. The most significant aspects of Storella's intellectual experience are his activity as a publisher of works from the ancient and medieval philosophical tradition, the texts of which had become difficult to find, together with his commitment to a strictly rational foundation for the study of nature.

Biography

Francesco Storella was born in Alessano in around 1529 (Antonaci 1966). He was introduced

to philosophical studies by his father Giovanni, who was a disciple of Pomponazzi. In Padua, Francesco listened to the lectures of Bernardino Tomitano, Panfilo Monti, and Marcantonio de' Passeri (known as Genua); he studied under excellent teachers and was a fellow student of other important figures, including the surgeon from Modena, Gabriele Falloppia.

In 1548, at 24 years of age, he was elected by the students as Rector of the University of the Arts.

In 1549, at the end of his year as rector, he received the academic degree of *Doctor Artium* and discussed the one hundred and fifty *Conclusiones* to earn the title of "public lector."

In 1550, the philosopher moved to Naples, where he became friends with Simone Porzio and Giovan Bernardino Longo, to whom he dedicated his work *Logicalium Caputum Decas Prima*. In Naples he wrote *De Definitione Logices*, his *Explanatio in digressione undecimi commenti Averrois*, and *De inventore Logices*; he also republished and provided a commentary for the pseudo-Aristotelian *Secretum Secretorum*. In 1557, Storella taught at the *Studium* in Salerno and published *Libellus an singulare syllogismus ingredi*, against Girolamo Balduino. The following year, he was back in Naples. Storella's numerous stays in Alessano are a constant feature throughout his life. He completed some of his main works during these periodic stays in the area around Otranto, including: *De inventore Logices*, *Tractatus quinquaginta contradictionum*, and *De Utilitate logicae*. He died of apoplexy in Naples, on December 18, 1575 (Storella 1549; 1553a, b; 1557, 1561a, b).

Heritage and Rupture with the Tradition

Storella's publishing activities are of great importance for understanding his relationship with the preceding philosophical tradition. Among the numerous works he republished, particular mention should be made of *Secretum Secretorum Aristotelis ad Alexandrum Magnum*, a long letter reputedly sent by Aristotle to Alexander the Great, in which he discusses issues concerning politics,

medicine, and astrology. Storella's edition, the last Latin edition of the text to be printed, is the only one with a preface and a substantial body of footnotes, which shows a clear tendency to discuss topics concerning the good government of the State (Schmitt 1982). Another characteristic feature of Storella's work was his attention to medical and scientific studies, which he cultivated in particular during his years in the Studium of Salerno. This interest explains his republication of *Secreta secretorum Hippocratis* and *Libellus de venenis Averrois*. Storella is also credited with reprinting Dante's *Quaestio de aqua et terra*, two works on the extent and authenticity of the Aristotelian *corpus* and a work on the arrangement of the *corpus* of Tomas Aquinas (Antonaci 1966).

Innovative and Original Aspects

Close adherence to the text, exegesis, and criticism were the characteristic features of Storella's philosophical research, which was animated by a constant polemic against Girolamo Balduino (Papuli 1967). His works insist greatly on the importance of recovering the classical world through direct, unmediated study of Greek and Latin texts. His thought is permeated by a certain eclecticism, with references to aspects from Plato, Averroes, Duns Scotus, and William of Ockham. Storella's predilection for the study of logic can be noted from the titles of his works alone, which are barely transliterated from Greek. He considered logic as both the science of thought and the science of the real, as it allows us to grasp things and then study their nature. Logic was both a practical and a speculative science. On the one hand, it had the characteristics of a theoretical discipline, and on the other, it provided cognitive tools for all the other sciences (Antonaci 1966; Longo 1996; Paladini 2009).

Impact and Legacy

The most significant aspects of Storella's intellectual experience are his activity as a publisher of works from the ancient and medieval philosophical

tradition, the texts of which had become difficult to find, together with his commitment to a strictly rational foundation for the study of nature (Schmitt 1982; Verardi 2012). He receives little mention in scholarly historical reconstructions of Italian culture during that period, and recent academic interest in his cultural activity has been focused on his role in the debate on logic in Padua and, above all, on his work as a publisher, particularly of the pseudo-Aristotelian *Secretum secretorum* and Dante Alighieri's *Quaestio de aqua et terra*. His commitment to republishing texts of unquestionable philosophical and literary interest is the aspect that best represents his contribution to the cultural debate of sixteenth-century Italy (Antonaci 1966).

Abstract

Johann Sturm was a Reformed pedagogic innovator, who established a teaching curriculum for gymnasia in order to provide an education based on the humanist ideals and on evangelical piety. This model described the

contents and the method of learning for boys from 7 to 16 years and consisted mainly of the study of grammar, rhetoric, and dialectic (based on Cicero and on classic literature). His method of learning was based on memorization and imitation rather than on the understanding of formal rules of reasoning. This model, rather than introducing students to religion, was intended to prepare them for the autonomous understanding of Scripture. Sturm was important also as he contributed to the innovation of biography as a genre, which he intended as more realistic than the typified premodern biographies.

Biography

Johann Sturm was born in 1507 in Schleiden, in the region of Eifel. After having received his first education in the house of the count Dietrich of Manderscheid, in 1521 he moved to the Gymnasium of Saint Jerome of Liège, where he studied Latin, Greek, the logic of Aristotle, mathematics, and some elements of theology, in accordance with a division of subjects he will assume as a model for his Gymnasium (Tinsley 1989, 24). In 1524 he moved to Leuven, where he attended the lectures of Latin of Conrad Goclenius and of Greek of Rutger Rescius (with whom Sturm associated as bookseller) and obtained his M.A. In 1528 he moved to Strasbourg and followed the lectures of Martin Bucer, while in 1529 he moved to Paris, starting to study medicine and lecturing at the Collège Royal from 1534, under the protection of Guillaume Baudé. His lectures were on Cicero's *Partitiones oratoriae* (Sturm 1546) and on the dialectic of Rudolf Agricola and were attended by Petrus Ramus. Probably under the influence of the Swiss physician Ludwig Carinus, he embraced the Reform. After the failure of the reconciliation between the French King Francis I and the Protestants, Sturm left Paris in December

1536 for Strasbourg, governed by the *Stettmeister* Jakob Sturm (not related to Johann). Jakob Sturm had supported the Reformation in Strasbourg since 1524, and in 1530 the town became part of the Tetrapolitan Confession, as well as of the Lutheran *Confessio Augustana* (1531) (Brady 1995). Accordingly, an educational reform consistent with Reform had to be initiated: from 1524 the Lutheran theologian and botanist Otto Brunfels assumed the direction of the Strasbourg Latin school, while at the cathedral Bucer gave lectures on the New Testament. For the end of providing an education to the younger, Johann Sturm was granted to found and direct the *Gymnasium Illustre* (1538), whose pedagogic manifesto was his *De literarum ludis aperiendis* (Sturm 1538a and 2007). Eventually, Emperor Maximilian transformed the *Gymnasium* into an Academy in 1566–1567. In 1564 Sturm set the program for a gymnasium in Lauingen, for which he wrote the *Scholae Lauinganae* (1565). However, from the 1560s, he suffered attacks from the Lutheran pastor Johannes Pappus, who addressed his supposed Calvinist theology (Kittelson 1977; Schindling 1977, 132–140) and led him to lose his position in 1581. He then retired in Northeim and died in Strasbourg in 1589 (Schmidt 1855; Tinsley 1989, 23–26; Schröder 2009, 12–22).

Innovative and Original Aspects

Sturm was a humanist – i.e., a scholar devoting himself to the *studia humanitatis* (i.e., mainly to grammar and rhetoric) (Tinsley 1989, 24; Kristeller 1955, 9–11; Sturm 1538b, 1574, 1575, 1576) – and a pedagogical innovator. His main aim was to provide a reform of high education based on the humanist ideal and on Christian faith (Schröder 2009, 9–14), i.e., to pursue a “wise and eloquent piety.” In his *De literarum ludis*, he outlines an educational program based on the study of the classics and covering the disciplines of the *trivium*: grammar, rhetoric, and dialectic (including logic). It is divided into nine grades, for boys from 7 to 16 years. In the first year, students study Cicero’s letters, while in the next ones Virgil, Horace, Terence, Plautus, Caesar, and

Sallust, and the works of Cicero, whose civic orientation makes him the foremost author to be studied (see Cicero 1540 and 1541). In the fifth year, they begin with Greek, and in the sixth, they learn Aristotle’s logic and poetics, together with other Greek authors such as Homer and Demosthenes. In the eighth, they study Hebrew, while in the ninth year they start with mathematics and astrology. To this cycle, a 5-year-long series of lectures on law, medicine, and theology, as well as on philosophy, literature, and oratory follow, in order to complete the education of boys until the age of 21 (Tinsley 1989; Sturm 2009a; Mehl 2009). Sturm’s teaching method was based on memorization and on the imitation of models, disputations, and declamations, which replaced the teaching of the deductive apparatus for logic. This approach is borrowed from the dialectic of Agricola (Sturm 1539) and from Melanchthon’s use of rhetorical *loci communes* (Mesnard 1966; Tinsley 1989, 30–31). As to the relation between education and religion, Sturm restricts religious education to the reading of the history of Christ and Moses, as the humanist education he was proposing had only to enable students to read Scripture, thus acquiring “literary piety” (Mesnard 1965). This model was refined in his further writings, as in his *Scholae Lauinganae*, the program is accelerated into five classes, although maintaining the contents of the Strasbourg Gymnasium grades (Sturm 2009b; Schindling 2009), while, in the *Classicae Epistolae*, (1565) a tenth grade is added to the program and the focus is given mostly to the learning of Latin and classic literature (Sturm 1938; Tinsley 1989, 35–36; Spitz and Tinsley 1995; Schröder 2009, 371–375). The influence of Sturm’s pedagogy spread from Germany and Alsace – where it coexisted with the Jesuit colleges (Negruzzo 2005) – to England, where Sturm’s pedagogy was praised in the *Schoolmaster* of Roger Ascham (Armytage 2012, 2–4), and to Poland-Lithuania, Bohemia, and Riga (Pietrzyk 2009; Holý 2009; Klöcker 2009). Finally, Sturm is important as a founder of the modern genre of biography, more realistic and less morally oriented and typified than premodern biographies, signaled for the first time by Jakob Burckhardt

(Burckhardt 1990) and exemplified by Sturm's *Beati Rhenani Vita* (1551). The life of Beatus Rhenanus (1484–1547) is described in contrast with Sturm's humanist ideal of man, devoted both to letters and to civic life, which was neglected by Beatus (Weiss 1981; Backus 2009).

Abstract

Francisco Suárez, S.J., born in Granada, Spain, in 1548, was perhaps one of the brightest luminaries ever produced by the Society of Jesus. Astonishingly, his early years and youthful academic promise were mediocre at best. After being initially rejected for admission to the Society of Jesus, scholasticism's future *Doctor Eximius* was eventually admitted with probationary status. During his early formation, Suárez experienced an almost supernatural intellectual transformation. Ordained a priest, the Jesuit went on to hold many teaching

positions throughout Spain, Rome, and eventually Portugal's University of Coimbra. His literary output was both enormous and systematic. The *Disputationes metaphysicae*, published in 1597, put the science of metaphysics on a new footing. For the first time, metaphysics was treated according to the logical exigencies demanded by the science itself rather than by the commentarial practice that the haphazardly arranged treatises of the Metaphysics had generated. Suárez was also drawn into numerous controversies between the Holy See and various political powers. One such controversy pitted Suárez against James I, which resulted in Suárez's *Defensio fidei* in which the oath of allegiance was roundly critiqued. Suárez's political and legal philosophy was spelled out further and more explicitly in his *De legibus*, which treated everything from the nature of law (eternal, human, natural, civil, and canonical) and justice to war, ecclesiastical and temporal powers, and the old and new laws. After teaching at the University of Coimbra for nearly 20 years, Suárez retired from the classroom and sought a climate that would accommodate his ailing health. This eventually led him to Lisbon where the *Doctor Eximius* died in 1617.

Biography

Francisco Suárez, S.J. (Granada, 5 January 1548–Lisbon, 1617), scholasticism's *Doctor Eximius*, was without doubt one of the most significant and influential thinkers within the Society of Jesus and, as some have argued, served "as the main channel by which scholasticism came to be known by modern classical philosophers" (Maurer 1962, p. 356). Be that as it may, Suárez's beginnings were rather unremarkable, and his academic aptitude seemed lackluster at best. He was born to Antonia Vázquez and Gaspar Suárez in the wake of a recently reconquered Spain (Fichter 1940, p. 6). When still a youth, aged only 13 years, Suárez was sent to Salamanca to pursue studies in canon law. Amazingly, the man who would decades later become a master of law

and author of the *De legibus* barely managed to pass his early coursework (*ibid.*, pp. 11–12). Perhaps, more important than his studies in canon law at Salamanca, at least with respect to Suárez's future vocation, was his making the acquaintance of Juan Ramirez, an Andalusian Jesuit known for his captivating sermons and encouragement of vocations to the Society of Jesus (*ibid.*, p. 45). Inspired by Ramirez, Suárez pursued a vocation with the Jesuits, but, much to the astonishment of his biographers, the young man was rejected, and the reason given was his lack of intellectual aptitude (*ibid.*, p. 38). Though lacking in academic gifts, at least by the Society's estimation, Suárez was not lacking in persistence. Eventually, after at least one unsuccessful appeal to the Jesuit provincial in Castile (*ibid.*, p. 48), on 16 June 1564 Suárez was granted admission to the Society but only as an "indifferent," that is, as one whose future as a priest or lay brother in the Society was left undetermined (*ibid.*, p. 51). After 2 years, Suárez professed his first simple vows in August 1566 (*ibid.*, p. 53).

Suárez's superiors could hardly be surprised when the young Jesuit's early studies revealed the mediocre talent and learning difficulties that they had come to expect from him. What provoked great astonishment among his superiors, however, was Suárez's almost instantaneous and complete intellectual transformation. The same philosophical problems that had only days before (sometimes just 1 day before) seemed insoluble to the young Jesuit were untangled with ease proper to a master (*ibid.*, p. 69). Some of Suárez's biographers, perplexed at his radical turnaround, find no other explanation besides divine intervention mediated through the intercession of the Mother of God (*ibid.*, p. 69). Whatever the cause, Suárez's future was determined; he would advance in the study of theology, and he did so at Salamanca from 1566 to 1570 (*ibid.*, p. 74).

While still a student, Suárez was tasked with the responsibility of teaching philosophy to new members of the Society of Jesus (*ibid.*, p. 70). Among his pupils was Gregory of Valencia, who would later become famous in his own right as a professor of philosophy and theology at the Roman College. In 1571, prior to his ordination

to the priesthood, the Society moved Suárez to the Jesuit College in Segovia, where he made his solemn profession of vows on 14 December 1571. Not long after he was ordained a priest in March 1572 (De Scorraile 1912, I, pp. 130–133).

Though it is an exaggeration to say that Suárez's priestly activity was exclusively academic and non-pastoral, his scholarly activity and production are almost without equal. Until 1574 he taught philosophy at Valladolid and then taught theology until 1580 (Fichter 1940, pp. 149–150). His scholarly output consisted principally of commentaries upon Thomas Aquinas's *Summa theologiae*, as had been the common academic practice at the time. From Valladolid Suárez was called to Rome to teach at the Roman College (ibid., pp. 111–119). The Roman climate proved to be incompatible with the Jesuit's frail constitution, and so at the end of the 1585 school year, Suárez was forced to return to the more hospitable climate of his native Spain, where he resumed teaching at Alcalá (ibid., p. 126).

While at Alcalá, Suárez played a significant role in the creation and implementation of the *Ratio Studiorum*, the Jesuit pedagogical plan. Additionally, Alcalá witnessed the first publications of the budding academic (ibid., pp. 136–138). In 1590 Suárez's treatise dealing with the Incarnation went to press (ibid., p. 149), and only 2 years later (1592) he published yet another volume devoted to the life of Christ, the *De mysteriis vitae Christi*, in which work was intended for the benefit of scholars and preachers of the Word alike (ibid., p. 154). In 1593 Suárez's frail health, exacerbated this time by tensions with his rancorous Jesuit colleague Gabriel Vázquez, prompted him to leave Alcalá and seek relief in Salamanca (ibid., pp. 168–170).

By this time, Suárez had already attained celebrity-like status as a theologian, and so Salamanca was only too happy to receive back its most famous alumnus. The peace that Suárez had begun to enjoy in Salamanca and the leisure to pursue his scholarly projects served as the perfect environment for the Jesuit to begin one of his most important and significant works: the *Disputationes metaphysicae*. This peace of mind

was short-lived, however, since, in May 1596, King Philip II commanded the Society of Jesus to send Suárez to the University of Coimbra where he would assume the principle chair of theology (ibid., p. 205). After several futile protests, in 1597 Suárez was finally obliged to assume the post.

The relative peace that Suárez had enjoyed in Salamanca was replaced with turmoil and conflict in Coimbra, not the least of which was the *De auxiliis* controversy that embroiled not only the Spanish Dominicans (largely following the banner of Bañez) and the Jesuits (chief among whom was Luis de Molina) but also the entire Church. Only an intervention by the pope (Clement VIII) could calm the matter, but even then the matter was never really resolved. Beyond controversies over free will and grace, the black plague, which was afflicting the area in 1599, forced Suárez to seek refuge once again in Salamanca before he could return to Coimbra to begin lecturing on Law between 1601 and 1603 (Fichter 1940, p. 240). These lectures would become the basis for the Jesuit's massive study on law published as *De legibus*. Like its metaphysical counterpart, the *De legibus* is a systematic and exhaustive work that examines various types of law (eternal, natural, international, positive) over the course of ten books.

After his course on law, Suárez turned his intellectual gaze to a study of the sacrament of penance, which resulted in the publication of his *De poenitentia* (1602) and *De censuris* (1603) - (Fichter 1940, p. 249). The speculations contained in these volumes led to a serious conflict between Suárez and the Holy See over the subject of epistolary confession, which Suárez supported and the Holy See condemned. After a trip to Rome to give account of his position to the Holy See, a position that Suárez would end up retracting, the Jesuit returned to Coimbra in 1605 to resume teaching and writing (ibid., p. 263).

Suárez's reputation was soon restored, however, when he entered into a dispute between the Holy See and Venice regarding the extent of papal jurisdiction. He sided with the Holy See and authored the *De immunitate ecclesiastica contra Venetos* in support of the pope. The work so

endeared him to Pius V that on October 1607, Suárez received from the pope the title *Doctor Eximius et Pius* (ibid., pp. 272–273). Yet Suárez would soon be swept up into an even fiercer controversy, this time concerning James I of England. At issue was the oath of fidelity that James required of all his subjects. Paul V condemned the oath and enlisted the service of his finest theologians, including not only Suárez but also Bellarmine, to critique the oath. For Suárez's part the result was his *Defensio fidei catholicae*. In it Suárez insisted upon papal authority and claimed that the crown has no primacy over the pope in spiritual matters. The work was completed in 1610 but, owing to a shortage of printing materials, was not published until 1613 (ibid., pp. 295–300).

By this time, Suárez's career as a professor was drawing to a close. After having taught at Coimbra for nearly 20 years, the *Doctor Eximius* retired in July 1615 (ibid., pp. 204–208). Though his teaching duties were abrogated, Suárez remained scholarly active, revising several of his works for publication, including the *De gratia*, *De religione*, *De angelis*, *De opera sex dierum*, and *De anima* (ibid., pp. 326–327). Ever in search of a more suitable climate that would accommodate his frail constitution, Suárez moved to Lisbon in order to complete his projects. Yet, once again, the Jesuit found himself in the midst of political and ecclesiastical turmoil, and, as to be expected, the subject of dispute was jurisdiction, more specifically, ecclesiastical and civil jurisdiction over property rights. The squabble was so intense that the entire city was eventually placed under interdict (ibid., pp. 330–333). After his own investigation into the matter, Suárez himself came to the conclusion that the interdict was indeed licit according to both canon and civil law (ibid., p. 331).

As the political atmosphere decayed, so too did Suárez's health. By September 1617 Suárez's health declined beyond hope for recovery. Ever industrious, he spent his remaining days dictating letters of farewell and accepted the ministrations of his fellow Jesuits as they helped prepare him for death. Early in the morning of 25 September 1617, Suárez serenely slipped into eternity (ibid.,

p. 338). In recognition of the incalculable contributions that Suárez made to the intellectual life of the Church, the papal representative, Archbishop Accoramboni, temporarily lifted the interdict in Lisbon so that proper funeral services could be celebrated for the deceased Jesuit (ibid., p. 338).

Disputationes metaphysicae

Suárez was by his own estimation a theologian. Yet, in the course of developing his theological doctrine, Suárez, as he explains in the preface *ad lectorem* of the *Disputationes metaphysicae*, recognized that it would be worthwhile precisely for his task as a theologian to make explicit the philosophical principles employed within his theology. Thus, while in the midst of his commentary on the *tertia pars* of Thomas's *Summa theologiae*, Suárez paused his theological work to undertake the composition of what would be a mammoth metaphysical project that went entirely beyond the commentaries on Aristotle's *Metaphysics* that had been the standard practice of the time. Suárez organized his project according to the logic of the inner exigencies that the science of metaphysics required of itself: "And so to proceed with the greatest concision and brevity, and finally to be able to treat the things according to an appropriate method, we shall abstain – in that which concerns the text of Aristotle – from prolix explanations, and will consider the things themselves to which this wisdom is directed, with the order of the theory and the exposition that accords with them better" (*DM* 2 prol.). Nothing quite like the *Disputationes metaphysicae* had ever been produced before, and, while other Renaissance thinkers (such as Agostino Nifo, Crisostomo Javelli, and Diego Mas) authored texts that explored metaphysical themes explicitly and protractedly, none had produced a work that had the breadth, systematicity, and exhaustiveness of Suárez's 2,000-page masterpiece (Pereira 2007, p. 14).

Its novelty is undeniable, but so too is the *Disputationes metaphysicae*'s continuity with the medieval tradition. Étienne Gilson notes that insofar as the *Disputationes* locate their various theses

against the larger backdrop of the scholastic tradition and only after having evaluated thoroughly the claims made within that tradition concerning the issue at hand are they properly understood as an extension of medieval thought (Gilson 1956, p. 96). Indeed, according to Gilson, “Suárez enjoys such a knowledge of mediaeval philosophy as to put to shame any modern historian of medieval thought” (Gilson 1956, p. 99). Despite his embeddedness within a continuing tradition, the originality of a creative thinker shines through clearly. The opening *disputatio* examines the nature of metaphysics in general and attempts to determine the proper object of metaphysics. Suárez considers and rejects six theses concerning the adequate object of metaphysics before advancing his own claim that metaphysics has its adequate object being insofar as it is real being (*ens in quantum ens reale*) (DM 1.1.26). This opinion, notes Suárez, is consonant with the majority of the tradition and agrees with Thomas Aquinas, Alexander of Hales, Duns Scotus, Albertus Magnus, Alexander of Aphrodisias, and several who have followed in their wake. What is more, so construed, metaphysics considers not only the divine being but other immaterial and material substances as well as their real accidents. Excluded, however, are beings of reason and *ens per accidens* (ibid.).

In the second *disputatio*, Suárez treats the character of being in general, its properties, and its causes, a task which is carried out in the remainder of the first part of the *Disputationes metaphysicae* (i.e., disputes 1 through 27). More proximately, Suárez is concerned with the features of being that allow the natural powers of the intellect to grasp it. Here, he turns to an examination of formal and objective concepts as they pertain to metaphysics. A formal concept, explains Suárez in agreement with common scholastic teaching, “is said to be the act itself, or (what is the same) the *verbum* by which the intellect conceives a thing or common feature [*commune rationem*]” (DM 2.1.1). To this the Jesuit contrasts the objective concept which is “said to be the thing or *ratio* which is properly and immediately known or represented by the formal concept” (ibid.). By way of example, Suárez explains that when one conceives a man, that

act, which is effected in the mind for the purpose of conceiving a man, is called the formal concept, but the known man represented by that act is called the objective concept, a “concept,” Suárez adds, that is so-called through extrinsic denomination relative to the formal concept through which its object is said to be conceived (ibid.). The latter concept is of chief importance for Suárez since not only does it pertain to singular things, it also pertains to universals, confused things, and common features among things as well as privations, negations, and the like. The second disputation primarily explicates the objective concept of being as such according to its complete abstraction, in which concept is, for Suárez, the “object of metaphysics.”

Since an examination of the objective concept is laden with great difficulties, Suárez proposes to conduct his investigation by turning to the formal concept since it is “more knowable” (*notior*) than the objective concept (ibid., 2.1.1). What is more, since the formal concept, objective concept, and *vox* signifying them maintain a proportional relationship among themselves, Suárez thinks that one can argue from one to the other (ibid., 2.2.24). Some have suggested that the Jesuit’s approach, though realist in orientation, adumbrates modernity’s epistemological shift, epitomized by René Descartes who makes an intramental subjective act (consciousness) – the correlate to the formal concept – the measure and guarantor of the real, the correlate to the objective concept (Pereira 2007, 31, pp. 137–139).

The third disputation concerns the properties and principles of being in general. Here, one finds Suárez’s transcendental analysis of the concept of being in which he differentiates himself from Scotus (DM 3.1.1–2), with whom, *prima facie*, the *Doctor Eximius* shares many points of similarity. Perhaps the most significant difference is that unlike Scotus, who regards the concept of being as *simpliciter simplex* – and thus as ultimately determinable by its transcendental disjunctive relations (e.g., infinite-possible, necessary-possible, etc.) – Suárez maintains that the concept of being is a confused one that “intimately transcends” its *inferiora* (3.1.6–8). As such, being is not really distinct from its *passiones*; it is only

conceptually distinct. This conceptual distinction has a basis in reality (ibid., 3.1.6), which implies, for Suárez, that being really includes its *passiones*, which are merely prescinded from in the intellect's inadequate conception of being (ibid., 3.1.12).

The fourth disputation explores transcendental unity in general. Suárez retains the by-then traditional claim that "unity adds nothing positive above being, neither in terms of a conceptual nor real addition, nor [does it stem] from the nature of the thing, nor only from the character of a distinct being" (ibid., 4.1.6). Rather, unity expresses a being's indivision by means of the negation of divisibility. Accordingly, inasmuch as unity is predicated upon a negation, it is conceived in terms of a relation of reason (ibid., 4.1.16). The fifth disputation narrows Suárez's transcendental analysis of unity to a consideration of individual unity and its principle. He explains the character of an individual or singular being by saying that it is "everything which is an actual being, or which exists, or is capable of immediately existing" (ibid., 5.1.4). Individuality does not add any real being to a common or specific nature (ibid., 5.2.8–9). What is fundamentally at issue here is the principle of individuation. Suárez rejects the Thomistic claim that signate matter functions as the individuating principle (ibid., 5.3.9–33), nor does the Jesuit accept the claim, attributed to Durandus, that substantial form serves as the principle of individuation for a material substance (ibid., 5.4.3). Finally, Suárez settles upon the notion that "in all singular substances, there is nothing lacking for the principle of individuation besides its own entity, nor beyond the intrinsic principles that are consonant with its being" (ibid., 5.6.1). The sixth disputation continues Suárez's exploration of unity but now with respect to the unity of forms and universals. He considers the Scotistic position, which holds that there is a formal unity in things that is distinct from a thing's numerical (individual) unity, as well as the Thomistic position, which holds that essence, taken precisely from the individual, does not have any real entity. Suárez agrees with all insofar as each holds that a per se formal unity congruent with each and every essence or nature is found in all

things (ibid., 6.1.8). He disagrees, however, in maintaining that the distinction between that formal unity and the individual is had through reason and does not stem from the thing or its nature (ibid., 6.1.9–10).

Since a recurring theme in the previous disputations is the notion of "distinction," Suárez devotes his seventh *disputatio* to a study of the issue. He first explores the nature of real distinction and then addresses the nature of a rational distinction. Briefly, a real distinction is basically the distinction of "a thing from a thing" (ibid., 7.1.1). Here, Suárez adduces the example of the distinctions that are obtained between and among various *supposita* and their accidents. A rational distinction, in contrast, "is that which formally and actually is not in things, which are thus denominated distinct, just as they exist in themselves, but only as our concepts subsist [in them], and from them they receive some denomination. . . ." (ibid., 7.1.4). As an example of a rational distinction, Suárez points to the distinction between and among attributes in God and also the relation of identity. The Jesuit then differentiates among various sorts of rational distinction. That distinction which has no foundation in a thing or reality is called a *distinctio rationis ratiocinantis*, which originates solely from functioning of the intellect. In contrast, a distinction that has a foundation in a thing is called a *distinctio rationis ratiocinatae*, in which distinction has some basis in reality prior to the operation of the intellect (ibid.).

With the basis established for the distinctions thus far employed, Suárez returns to his transcendental considerations and in the next four disputations addresses truth (disputations eight and nine) and goodness (disputations 10 and 11). Among the *passiones entis* truth is prior to goodness but is subsequent to unity. Suárez's reason for this order stems from the fact that the intellect, to which corresponds truth, is prior to the potentiality of the will, to which corresponds the good (ibid., 8 prol.). Following the "common opinion," Suárez holds that truth – as well as falsity – resides in the intellect's composing and dividing. Nevertheless he also admits that transcendental truth is intrinsically said of real being itself (ibid., 8.7.24).

Ultimately, such truth, while still denoting a relationship between the mind and the thing, consists in a relationship of correspondence to the divine mind (*ibid.*, 8.7.28–31). Disputation nine treats the opposite of truth, namely, falsity. Unlike truth, Suárez argues that falsity is not a feature or property of things. In fact, something can only be called “false” in a kind of metaphorical sense by means of extrinsic denomination (*ibid.*, 9.1.6).

The tenth disputation begins Suárez’s treatment of transcendental goodness. He considers theories that hold goodness to be a relation of reason and others that maintain it to be a real relation. Goodness does not add anything to being except the character of agreement (*convenientiae*), which is not a relation, Suárez insists, but only connotes the order between some nature and its own inclination, capacity, or conjunction with a perfection; thus, goodness is rightly said to be the perfection of a thing (*ibid.*, 10.1.12) and is founded on being (*ibid.*, 10.3.3). The eleventh disputation explores the converse of goodness: evil. Like the previous scholastic tradition, Suárez holds that evil is not a thing or a positive form, nor is it merely a negation. Rather, evil is a privation of some perfection that should be present in a being (*ibid.*, 11.1.3).

Disputation 12 begins a protracted treatment of the causes of being in general, followed by specific studies on the material cause of substances (disputation 13), the material cause of accidents (disputation 14), the formal cause of substances (disputation 15), the formal cause of accidents (disputation 16), efficient causality in general (disputation 17), proximate efficient causes (disputation 18), and necessity and contingency in efficient causality (disputation 19). Disputations 20 through 22 focus on creation as a specific instance of causality and related themes, namely, the concurrence of primary and secondary causes and the conservation of being. Returning to his treatment of the remaining four Aristotelian causes, the 23rd disputation treats final causality in general before examining – in disputation 24 – the ultimate end in particular. Suárez studies exemplar causality in the 25th disputation, and then in the 26th disputation, he considers the causal community that emerges between causes

and their effects, in which it is seen that no effect exceeds the perfection of its cause. Disputation 27 closes the first part of the *Disputationes metaphysicae* and offers a comparison of causes as they relate among themselves.

The second part of the *Disputationes metaphysicae* opens with the 28th disputation in which Suárez traces the descent of the common concept of being to its *inferiora*, namely, the disjuncts’ infinite and finite being. Important here is Suárez’s doctrine of the *analogia entis*, which attempts to balance two metaphysical dynamics: the unitary concept of being and the priority-posteriority of that concept as it descends to its *inferiora*. While Suárez is committed to the unitary concept of being, owing to the scientific demands of metaphysics that require a unified subject (*DM* 28.3.15), he does not embrace the Scotistic doctrine of univocity (*ibid.*, 28.3.5). Suárez’s disagreement with Scotus stems from the fact that, according to the Franciscan thinker, a univocal concept descends to its *inferiora* equally without an ordering of priority and posteriority. But, in the Jesuit’s eyes, there is an order in the descent of the concept of being since it pertains first (*per prius*) to God, who is being essentially, and secondarily (*per posterius*) to creatures, which are being *per participationem* (*ibid.*, 28.3.17). In noting an ordered relation within the concept of being, Suárez insists upon its analogical character. Yet the kind of analogy advocated here is far from the standard Thomistic view espoused by Cajetan and later affirmed by John of St. Thomas. In fact, Suárez’s view of analogy is hardly Thomistic at all. For Cajetan, analogy was understood in terms of proper proportionality – that is to say, a four-term relationship in which a: b::c:d – and attribution was inappropriate to a metaphysical project since, according to the Renaissance Dominican, attribution is entirely extrinsic. Yet, as Suárez sees it, proportionality is extrinsic and attribution – which denotes an ordered relation of cause to effect – functions intrinsically, whereby it is capable of accommodating the exigencies proper to being (*ibid.*, 28.3.11).

The 29th disputation is the locus of Suárez’s argument for God’s existence. He allies himself

with thinkers such as Albertus Magnus and Duns Scotus and, more remotely, with Avicenna, insofar as they favored an argument that was more metaphysical in character than the physical argument that had been the choice of Averroes (ibid., 29.1.3). Predisposed to a metaphysical approach, the Jesuit finds Thomas's proof centered upon the claim that "*omne quod movetur ab alio movetur*" is insufficient for the task of demonstrating God for the reason that there are instances in which the proposition simply does not hold, for example, actions of the will (ibid., 29.1.7), nor can it attain an immaterial first cause (ibid., 29.1.8). Accordingly, Suárez reframes the premise metaphysically as: "*omne quod fit ab alio fit*" (ibid., 29.1.20). He thus formulates his argument for God's existence as follows: "every being is made or not made (i.e., uncreated); but not all beings in the universe can be made; therefore it is necessary for there to be some being that is not made (or uncreated)" (ibid., 29.1.21). The major premise, argues Suárez, is evident since its necessity derives from two contraries; the minor premise argues against the possibility of an infinite regress with respect to created creator-beings and demands that one arrives at last at an uncreated-creator (ibid.).

After having demonstrated God's existence, disputation 30 develops Suárez's natural theology and proceeds to an examination of what God is. Hardly surprising, Suárez attributes all entitative perfection to God (ibid., 30.1.1). Additionally, despite the fact that finitude and infinitude have been understood to be attributes of mass, Suárez argues that God is properly understood as infinite (ibid., 30.2.2). He disagrees, however, with Thomas Aquinas who attributes infinitude to God on account of the divine *esse*'s not being received into some distinct essence or potentiality that would serve as a limitation (ibid., 30.2.19). Rather, as Suárez sees it, God's infinity consists in His possessing in His own *esse* the totality of all entitative perfection (ibid., 30.2.21). Only after having established God's complete perfection and infinitude does Suárez then conclude that God is pure act and entirely simple. The Jesuit then demonstrates in succession God's divine attributes: ubiquity, freedom,

unity, incomprehensibility, ineffability, life, knowledge, and will.

The 31st disputation moves on to a consideration of finite being, in particular, the relationship or distinction between finite essence and *esse*. By "*esse*," Suárez explains that he means the "actual existence of a thing" (ibid., 31.1.2). He first considers the (Thomistic) thesis that *esse* and essence are really distinct and, then, the (Scotistic) claim that their distinction stems from the nature of the thing, which is to say they are formally distinct. Suárez, however, describes and affirms a third thesis, namely, that *esse* and essence are distinct only according to reason (ibid., 31.1.13). As such, the Jesuit argues that prior to God's production of a creature, the creature's essence is "entirely nothing" (ibid., 31.2.1).

Disputation 32 focuses on created being in general and considers its division into substance and accident(s). The next four disputations (33–36) treat the nature of substance in general (including a discussion about the difference between primary and secondary substances), *supposita*, subsistence and its causes, and immaterial substances and their attributes. Of particular note, here, is Suárez's claim, supported by several arguments, that the existence of spiritual substances besides God can be demonstrated (*DM* 35.1). It is not repugnant, *ex parte rei*, that they should exist, nor is it impossible that the power to produce them efficiently should be lacking the first cause. In effect, Suárez argues that angels are possible (ibid., 35.1.3). He also maintains that the existence of an immaterial soul, which is incomplete yet immortal, suggests the possibility of the existence of a spiritual being that is not incomplete but more perfect than the soul (ibid., 35.1.4). Suárez also argues that the perfection of the universe requires grades of immaterial beings (ibid., 35.1.5).

The 36th disputation descends from a consideration of spiritual substances to a treatment of material substances, which are essentially the same, says Suárez, as corporeal substances that are composed of matter and form (ibid., 36.1.12). Additionally, the Jesuit rejects Averroes' claim that a material substance's essence consists only in its form and follows, instead, Thomas, who

argues that matter must also be reckoned to be part of the essence (ibid., 36.2.3).

The 37th disputation begins Suárez's treatment of the last nine Aristotelian predicaments, beginning, first, with a consideration of the nature of accidents in general, then explaining accidents' relation to substance in terms of priority and posteriority (*disputatio* 38), accounting for division of accidents into nine highest genera (*disputatio* 39), and, finally (*disputationes* 40 through 53), moving onto an examination of each accident individually. Disputations 40 and 41 deal with continuous and discrete quantity, respectively, while disputation 42 examines quality. Potency and act form the subject of the 43rd disputation. *Disputatio* 44 treats various *habitus*. The next two disputations return to a deeper consideration of quality in terms of contrariety (*disputatio* 45) and intensity (*intensio*) (*disputatio* 46). The 47th dispute addresses relation in general and in particular (viz., real, rational, etc.). Disputations 48 and 49 treat action and passion, respectively. Duration is then examined in *disputatio* 50. In the next two disputations Suárez attempts to establish a subtle but nevertheless real difference between place (*ubi*) (*disputatio* 51) and position (*situ*) (*disputatio* 52). That difference, he explains, amounts to the fact that *ubi* pertains to being "present" somewhere in terms of distance, but *situ* pertains to a thing's disposition in itself that results from an ordering of parts in a location, in which ordering does not include the notion of being "present" (*DM* 52.1.9). Then, in the 53rd disputation Suárez returns to *habitus*, but this time from the perspective of its being a certain genus of accident, that is, he considers it here as a quality or disposition (or a certain species thereof) of permanence.

Finally, Suárez concludes his mammoth *Disputationes metaphysicae* with a discussion of *entia rationis* (*disputatio* 54). At the onset of his metaphysical project, Suárez had clearly excluded *entia rationis* from the scope of metaphysics (*DM* 1.1.6). His reason was that *entia rationis* and *ens reale* do not fall under the same common concept of being (ibid., 1.1.4), in which concept is the adequate object of metaphysics (ibid., 2.2.1). Be that as it may, Suárez considers the examination of

entia rationis as beneficial to the study of real beings as well as for the successful progress of other sciences (ibid., prol.1). Beings of reason and real beings, though they have no metaphysical community, enjoy an analogical community in terms of proper proportionality (ibid., 1.1.5). As Suárez sees it, the "being" proper to *entia rationis* is simply that of being thought or *esse objectivum*. As such they only have an efficient cause, namely, the intellect that produces them, but none of the other four causes.

De legibus ac deo legislatore

The legal counterpart to the *Disputationes metaphysicae*, the *De legibus* is a massive and systematic exposition of law in all its categories: divine or eternal, natural, international (i.e., *jus gentium*), and positive or human. Composed of ten books, the *De legibus* begins with a consideration of law in general, the signification of the name "law," and related topics of concern (e.g., justice, the necessity of law, law's character or *ratio*, etc.). For Suárez, taken in its most fundamental sense, law is simply the rule of our operations and measure of their goodness or lack thereof (*De leg.* 1.1.1). He adverts to Plato's discussion of matters related to law the *Meno* wherein a twofold distinction is deployed between "art" and "custom," to which are added the notions of "order" and, with the *Timaeus* and *Gorgias* in mind, "natural propensity" (ibid., 1.1.2). Suárez then approaches law etymologically and tells the reader that "law" is drawn from the term "binding" (*ligando*) since law's "propter effect is to bind or oblige" (ibid., 1.1.9). Also of concern in the first book is the relationship between law and justice (*jus*). Justice signifies fairness and equality, which the law "prescribes" (ibid., 1.2.4); more specifically, "law" signifies "commanding" or "ordering" (*jubendo*), which Suárez identifies as the etymological origin of justice (*jus*) (ibid., 1.2.6).

In the second book of the *De legibus*, Suárez identifies and examines the nature of specific kinds of law, beginning with the divine or eternal law. Despite the claim that there can be no eternal law since it requires that it be imposed upon

someone and there is no creature coeternal with God upon whom the law could be imposed (ibid., 2.1.1), Suárez cites the common opinion of the theologians as militating against this position (ibid., 2.1.3–4). To this objection, Suárez responds with a distinction. Law can be taken in a twofold manner: first, as an internal disposition of the legislator and, second, as externally constituted through its imposition upon subjects. In the first sense, law can be eternally attributed to God, though not in the second (ibid., 2.1.5). For Suárez, the eternal law is fundamentally associated with the divine will. He denies that it governs immanent divine actions, such as the generation of the Word and Spiration of the Holy Spirit, for these actions follow entirely from the nature of God (ibid., 2.2.2). Rather, the eternal law pertains to God's free operations toward creation, that is to say, it pertains to the order God establishes within creation and the providential actions by which He governs the world (ibid., 2.2.3–4, 12–13).

At this point, the concern arises whether the eternal law is principally a matter of the divine mind or the divine will (ibid., 2.3.1). Suárez emphasizes the divine will and, in so doing, distinguishes himself from Thomas, who associates the eternal law with divine reason (Doyle, p. 14). For Suárez, the eternal law concerns the absolutely free decrees of God as they establish order, either generally as all parts of the universe are ordered to a common good, or immediately as these parts agree with the character of the whole universe (*ratione totius universi*), or specifically with respect to the order by which intellectual creatures measure their own actions (*De leg.*, 2.3.6). While divine providence, in terms of its governance, would seem to pertain to the eternal law, Suárez is careful to distinguish the two and follows Thomas in holding that the eternal law is compared to providence as general principle to particular conclusions or actions, just as occurs in the case with humans for whom first practical principles are compared to prudence (ibid., 2.3.12). Moreover, as the eternal law “is God Himself,” it has no cause over it (ibid., 2.4.1) but is the cause of certain effects that follow from it. Here, Suárez notes that the eternal law extends to its inferiors, namely, creatures, not so much by

imposing obligation upon them, but by inducing in them an “instinct, inclination, or naturally determined impetus to one thing” (ibid., 2.4.1).

In relating the eternal law to various other laws, Suárez explains that the eternal law is participated in by the natural law which concerns the rational order discoverable in nature; in a particular way, the natural law concerns those beings of a rational nature (ibid., 2.2.1), for it is, he says, “nothing other than rational nature itself” (ibid.). The reason for this claim stems from the fact that a rational being has the intellectual power to discern what is in accord (or discordant) with its own nature (ibid., 2.5.1). In fact, Suárez maintains that the natural law most properly exists in the actual judgment of the mind (ibid., 2.5.14). Nevertheless, it is distinct from conscience. Natural law pertains to a general rule regarding action, whereas conscience pertains to a particular situation or practice; in short, the latter is the application of the law to a particular work. Thus conscience applies not only the natural law, Suárez says, but other kinds of law (divine or human) as well (ibid., 2.5.15). In its most general consideration, then, the basic precept of the natural law is to do good and avoid evil (ibid., 2.7.5). Because the natural law is a feature of rational nature itself, Suárez disagrees with those (e.g., Navarrus and Sancius) who hold that it can be abrogated or dispensed by any other law or human power (ibid., 2.14.1). The pope, who is unable to dispense the divine law, is certainly not able to dispense the natural law (ibid., 2.14.5) nor is the king for that matter (ibid., 2.14.10). What is more, Suárez thinks that not even the absolute power of God is able to dispense with the natural law. Though the natural law, he says, includes the precepts and prohibitions of God, there is nevertheless supposed within nature an intrinsic value or worth (*honestum*), and, thus, God cannot not prohibit the rational creature from carrying out that which natural reason shows to be evil and dissonant with nature which is immutable (ibid., 2.15.4).

Stemming from the natural law is the *jus gentium* or law of nations. The *jus gentium* is natural in the sense that it derives from the dictates of (natural) human reason, but it is not to be

confused as it often is, Suárez thinks, with the natural law. Though the *jus gentium* is “nearest” to the natural law, it is actually between the natural law and human law (ibid., 2.17.1). Suárez notes that some distinguish natural law from the *jus gentium* insofar as the former is common to brutes as well as humans, whereas the latter pertains exclusively to the social relations of humans (ibid., 2.17.3). The Jesuit himself, however, marks a distinction between the two by noting that the natural law pertains to conclusions that are necessary that follow, not upon the will of individuals or society, but upon the principles of nature. The *jus gentium*, however, pertains to those conclusions that, though they follow from nature, are not absolutely necessary but consider the circumstances attendant upon human society and its conservation (ibid., 2.17.9). Accordingly, the *jus gentium* cannot be reduced to the natural law, nor can it be identified merely with conventional character of human positive law. Though it stems from the consistent social customs practiced across almost all nations, it does so with respect to a nature that is diversified across various cultural contexts (ibid., 2.19.6). The upshot of the *jus gentium* so construed is that it can serve as common stage of social discourse among various cultures. To be sure, the Jesuit points out that the *jus gentium* does not have as its intent or goal the formation of a global society or single nation. Rather, it serves as a forum for each and every republic, whereby each nation can interact justly and, if need be, redress injuries (ibid., 2.18.5). The *jus gentium* possesses special competence, then, to address issues such as ambassadorial privileges, commerce, war, trade, and even marriage (ibid., 2.19.10).

Book three of the *De legibus* descends from a consideration of the natural character of law to a treatment of positive human law. One of the main theoretical questions regarding human law is “whether humans can impose obligations upon themselves through proper laws” (ibid., 3.1.1). There is some doubt whether such a possibility exists since humans are free beings and, as sacred scripture itself says, “only God is the king, legislator, and master of men” (ibid.). Be that as it may, Suárez argues that man is firstly a social

animal and naturally and rightly seeks to live in community (ibid., 3.1.3). The Jesuit then notes that a community can either be familial or political. The former is “maximally natural and quasi fundamental” (ibid.), but, because of want or needs that could not be fulfilled within familial society, humans enter into community with others, thereby generating the state (ibid.). This association, moreover, is a free consequence of the will, and it is from the consent of its constitutive individuals that the state receives its power (ibid., 3.3.1). Of course, Suárez thinks that the ability to enter into agreement with the state is ultimately given by God: “In this matter the common opinion is seen to be that this power [to form political communities and author legislation] is given immediately by God as the author of nature; therefore men quasi-dispose matter and effect a capable subject with this power, God, however, quasi-bestows the form giving this power” (ibid., 3.3.2). God has thus immediately given humanity the power to punish evil doers (even to the point of putting them to death), to enact policies encouraging the good, to impose obligations, and to vindicate injuries of individuals (ibid., 3.3.3). Nevertheless, the state receives its power immediately from the people, and it is up to them to determine what form of government to adopt (*Def. fid.* 3.2.9). One may thus justly consider Suárez to be the progenitor of modern day democracy (Pereira 2007, p. 20). Still, Suárez himself thinks that monarchies are the best form of government (*De leg.*, 3.4.1). But even so, the king’s authority and power are not absolute, for that power stems not immediately from God but is instead derived from the people (*Def. fid.* 3.2.8). Accordingly, when a king steps beyond his authority and becomes tyrannical – as was the case with James I, according to Suárez in agreement with Bellarmine – the populace has the right to defend itself (ibid. 3.3.3). Indeed, Suárez even holds that it is just for a person attacked by a tyrannical king to defend himself, even if it should result in the king’s death (*Def. fid.*, 6.4.5; Doyle, p. 347).

The fourth book of the *De legibus* moves onto a treatment of canon law, that is, Church law. The Church, Suárez argues, does indeed have the

power to rule and govern itself; he cites both biblical authority – in which Christ gives the keys of the kingdom (i.e., authority) to Peter to bind and loose sins (*De leg.*, 4.1.2) – and Church tradition (ibid., 4.1.5). The Jesuit marks a distinction between canon and civil law insofar as each has distinct ends. Canon law pertains to supernatural felicity, the final unification of diversity, and the sanctification of the soul; civil law, however, pertains to the temporal governance of the political body (ibid., 4.2.1). The authority with respect to canon law pertains in a special way to the pope since, according to Suárez, Christ immediately gave Peter authority (ibid., 4.3.1). Nevertheless, that authority was also extended to the rest of the apostles such that Peter – the pope – could bestow the authority he received to other members of the Church; here, Suárez has in mind the rest of the bishops of the Church. Like Bellarmine, Suárez accords primacy to the pope – the head of the Church – and denies that the rest of the apostles are equal in power or jurisdiction (ibid., 4.3.4). But inevitably the question arises as to who is superior in jurisdiction and power: the papacy or the civil ruler; the Church or the state? Not surprisingly, Suárez accords supremacy to the Church. Nevertheless, Suárez's answer is far from simplistic and recognizes the difficulties involved in Church-state relations. The Church, through the ministry of its priests, has the power to remit sins, ordain other priests, bind and dissolve censures, and dispense from the spiritual treasures of the Church. In terms of its universal extension, then, Suárez holds that ecclesial power is “clearly . . . far more excellent than civil power” (ibid., 4.8.1). In part, Suárez argues for the supremacy of the Church over the state because of the former's unity as a mystical body, which stands over the diversity of individual states (ibid., 4.9.3). The Church has jurisdiction over its subjects and thereby over members of the state. The state is related to the Church, in Suárez's mind, as the Church is itself related to Christ, namely, “as the body is subordinate to the soul” (ibid.). This is not to say that Suárez sees no limit to the Church's authority over the state, for the state retains its right to immediate jurisdiction over its temporal affairs. The Church's primacy, in contrast,

concerns a superiority of spiritual over temporal affairs (ibid., 4.11.3, 5).

Book five treats human law in its varieties, both written and non-written, and investigates its relation to conscience, penalties, and contracts. Book six marks the beginning of the second division of the *De legibus*, and in it Suárez considers who counts as the proper interpreter of law and what those particular circumstances might be in which the law can be abrogated or amended. Book seven studies the manner in which custom affects the formation of civil law, especially its codification. Insofar as custom always involves (good) moral character as the source from which its actions derive, the connection that morality has to the formation of law is examined (ibid., 7.1.4). Privilege forms the subject of discussion in book eight, whereas the old and new divine laws form the topics of books nine and ten, respectively. In book nine, Suárez notes that while the Mosaic law is obligatory, it is a law that is incapable of “saving” (ibid., 9.7.1–14). The new law, however – treated in book ten – exceeds and completes the old. The old law was necessary, he explains, but only as a preparation for the new (ibid., 10.8.18). In fact, the two are related, says Suárez, as “truth to shadow” (ibid., 10.8.18), such that if the old law is to have any salvific function, it is only through being completed in Christ, whose blood has “opened the gates of heaven” (10.8.18).

De anima

Suárez's explicit and most developed thought on human nature, the rational soul, and its various faculties are found across the six books that compose his *De anima*. The first book examines the substance, essence, and informing character of the rational soul. In this opening book, a rather straightforward Aristotelian account of the soul and its nature is presented. Suárez maintains Aristotle's teaching that the soul is “the first act of a physical corporeal substance organized so as to have the power of life,” and “that by which we live, feel, move about, and understand” (*DA* 1.1.1). For Suárez, a discussion of the rational soul must be unfolded against the backdrop of

Aristotle's philosophy of nature, which is ultimately understood in terms of the hylomorphic composition of form and matter (ibid., 1.1.2). As there are many different kinds of material substances, some living and some inanimate, and even among those substances that are living there are various grades (e.g., plants, animals, humans), the principle of differentiation cannot be matter – that which each kind of substance has in common. Rather, the differentiation must derive from the formal principle, which is simply what the tradition or “common opinion” has understood as the soul (ibid., 1.1.3, 4).

Although Suárez principally intends to examine the rational soul *ex professo* in the *De anima*, he does find it necessary to account for its distinction from, but also continuity with, the lower souls, namely, vegetative and sensitive souls (ibid., 1.4). Here, Suárez holds that that which is less perfect can be separated from that which is more perfect. And, so, the sensitive soul, which is more perfect than the vegetative soul, is separate therefrom and, a fortiori, so too is the rational soul. Thus, “when animals sleep, they live as plants” (ibid., 1.5.1). But, Suárez is noting, here, a distinction between and among grades of kinds of being, not (substantial) distinctions within one and the same being, for he disagrees with the theory, as taught by some medieval thinkers, that there is a plurality of substantial forms within one and the same being (ibid., 1.6). All three – the vegetative, sensitive, and rational – are united in one simplicity (ibid., 1.6.13), he says, and their distinction comes about only through precise abstraction (ibid., 1.6.14).

In the second book of the *De anima*, Suárez examines the various powers of the soul, especially its nutritive and life powers. Here, he argues for a real distinction between the soul and all its powers (Doyle, p. 13). Suárez locates his own position against the backdrop of four common theses pertaining to the matter: first, there are those (such as Gabriel Vázquez and Ockham) who maintain there is no distinction whatsoever between the essence of the soul and its powers; others argue for only a formal distinction as does Duns Scotus; while still others, for example, Bonaventure, hold there to be no distinction between

the soul and its vegetative powers but maintain a distinction only between the soul and its sensitive and rational powers; finally, Suárez cites Thomas, who holds that the soul is “really distinct” from all its powers (ibid., 2.1.2). For example, the nutritive powers, notes Suárez, whereby a thing exercises the operations attendant to life are accidental and thus distinct from the substance of the soul (ibid., 2.1.4). Following Anselm, Suárez explains that vital powers, insofar as they are vital, have a distinct definition (*ratio*) from the soul precisely as soul. Suárez then attributes this difference in *ratio* to follow from a difference on the part of the things (*ex parte rei*) involved. In short, the character of the soul, insofar as it is a form, is essentially ordered to a body, whereas powers are essentially ordered to operation (ibid.).

The third book narrows the discussion to a consideration of the sentient soul and thus cognition, its nature, and powers. Suárez examines the various external senses and notes what is specific to each before passing to the next. Of some note here, while in the context of discussing sight, Suárez has occasion to enter an excursus concerning the nature of light (ibid., 3.14). In such discussions the limits of the Aristotelian physics, to which Suárez certainly subscribed, are reached. The “old view,” which the Jesuit dismisses, simply holds that light is the manifestation of color. Others, however, consider light to be a body. Suárez finds fault with this theory too and follows Thomas's interpretation of Aristotle, which holds that light is an active quality of the substantial form of fire (ibid., 3.14.1). For Suárez's part, he defines light as a “per se visible quality in the air taken just as an object” (ibid., 3.14.5). Surprisingly absent from Suárez's consideration here, especially considering the Jesuit's exhaustive grasp of the history of philosophy, is any mention of Robert Grosseteste's *De luce* in which the topic of light is treated at length in the latter's cosmogonical account of the universe.

In the fourth book of the *De anima*, Suárez explores the nature of the intellectual power. The first order of business is to determine what counts as the adequate object of the intellect. In this regard Suárez considers and rejects the claim that the adequate object of the intellect is being

in general. Thomas, he notes, holds that the proper object of the intellect is the quiddity of a material thing, but, following Scotus, Suárez shows why that theory is lacking. The intellect can know things beyond that which is material, i.e., the angels and God. Also, the intellect grasps something insofar as it is intelligible, but whatever has being is intelligible. Therefore, it cannot be the case that the intellect is restricted to the quiddity of material things (ibid., 4.1.2). Thus, Suárez concludes that the adequate object of the intellect is “being in its total latitude” (ibid., 4.1.3). Here, the Jesuit faces the question as to whether or not beings of reason fall under the scope of being “in its total latitude” (Doyle, p. 13). Despite the fact that real being and beings of reason do not possess a formal unity, Suárez holds that beings of reason, though they have only objective being, presuppose real being. That is, beings of reason always entail some order to real being, which is why negations and privations can only be understood relative to real being (ibid., 4.1.4).

Also of particular note in the fourth book is Suárez’s claim that the intellect knows singular things, as opposed to just universals (Doyle, p. 13). He notes contrariwise that Aristotle and his followers (viz., Alexander of Aphrodisius) insist that one of the chief differences between sensation and intellection pertains to the fact that senses know singular things but the intellect, which trades in intelligible species, grasps universals (ibid., 4.3.1). Suárez also points out that, according to Thomas, the intellect does not directly know the singular, but attains knowledge of the individual only reflexively (ibid., 4.3.2). In contrast, the Jesuit thinks that the intellect forms distinct and proper concepts of both universals and singular things. As it is the case that the intellect is capable of forming propositions about both singular (e.g., “Peter is a man”) and universal things, it must be capable of forming concepts corresponding to both. Additionally, both prudence and faith are intellectual powers, yet each involves cognition of singular things. One must therefore maintain the ability to form proper concepts, Suárez thinks, of the singular (ibid., 4.3.3).

Suárez devotes the fifth book of the *De anima* to a study of appetites. Appetites are shared in

common by both animate and inanimate things. A natural appetite, he says, is the propensity of something to its own proper good (ibid., 5.1.1). Appetite seems to be a natural joining together, then, of one thing with some other thing to which the former is ordered. This ordering need not necessarily presuppose cognition (ibid.), and so the object of an appetite is whatever elicits such an act (ibid., 5.1.2), but that object is always regarded as something good (ibid., 5.1.5).

The sixth and final book of the *De anima* is devoted to an exploration of the separated soul. Here, Suárez notes some of the philosophical difficulties surrounding the matter, for example, whether the being (*esse*) that the separated soul retains is the same being (*esse*) as the whole human (ibid., 6.1.1). What is at issue is the metaphysical status of personhood since a person has always been understood as a whole or complete substance. Yet a separated soul obviously lacks completeness. Suárez cites Cajetan’s claim, which, although “obscure” and “was lacking efficacy” (*non vendicabat*), held truly that the separated soul is a “semi-person” (ibid., 6.1.1). This is a position that Thomas Aquinas himself had made (*ST* I, q. 75, a. 4, ad 2). Suárez thinks that the separate soul has the same subsistence that it had in the body and that, in experiencing separation, it does not, as Cajetan had thought, experience a change in being (*mutat entitatem*) but only a change in a mode of being (*DA*, 6.1.3). The separated soul, in Suárez’s view, does not itself change or attain a new kind of subsistence, but simply retains the kind of subsistence it already always had prior to the corruption of the body (ibid., 6.1.4). Nevertheless, he does agree with Cajetan in calling the separated soul a “semi-person,” for the reason that the subsistent soul remains only a part of the totality of a human person (ibid., 6.1.5). “Absolutely speaking, the soul’s status in the body is more natural” (ibid., 6.9.6), Suárez holds, and so the unnatural status of the separated soul lends credence to a philosophically meaningful expectation of the resurrection of the body (Doyle, p. 14). After all, it is maximally consonant with the inclination of the soul to be perpetually united to the body. Accordingly, Suárez thinks that it falls to the providence of

God, who is the author of nature, to reunite the separated soul with a body that is in some way incorruptible so that one's complete nature and perfection can be attained (*ibid.*, 6.9.6).

Suárez's Legacy

It is impossible to overestimate the profound influence Francisco Suárez's thought has had both on succeeding generations of scholastic (especially Jesuit) philosophers and on canonical modern and even postmodern thinkers. Long considered the father of modern philosophy, René Descartes' association with Jesuit education, especially at La Flèche, has been well documented. Descartes himself, in a letter to the French Jesuit Jacques Grandamy, acknowledges his profound intellectual debt to the Society of Jesus and claims that they prepared the foundation for all his future learning. In a subsequent letter to Marin Mersenne, Descartes identifies the Conimbricenses, in particular Francisco de Toledo and Antonio Rubio, as especially significant to his intellectual formation. Nevertheless, Suárez's own thought is never too far away, and, in replying to Arnauld's objections to Descartes' position on materially false ideas, the French philosopher appeals to the *Doctor Eximius* to validate his own claims.

But Suárez's influence may have had an even deeper, although perhaps subtler, influence on modernity's epistemological shift to the cognitive subject. As noted above, Suárez's second disputation of the *Disputationes metaphysicae* addresses the relationship between formal and objective concepts. The proper and adequate object of metaphysics, Suárez argues, is the common objective concept of being. But, as he also maintains, since the objective concept of being is "more difficult to understand" than the formal concept, which, as a product of our own intellect, is more knowable, his metaphysical project will unfold with special reference to the formal concept (*DM* 2.1.1). In other words, Suárez has placed a subjective act (the formal concept) as the criterion and judge of what is real (the objective concept) (Pereira 2007, pp. 137–139). One

might thus argue that the path to modernity was clearly pointed out, and, though Suárez remained a metaphysical and epistemological realist, the inversion of the mental over the real would be accomplished with the Cartesian cogito's elevation as the standard for objectivity and Clemens Timpler's understanding of reality as fundamentally the "*pan noēton*" (Doyle 2012 B, pp. 70–71).

Whereas Descartes, much to the frustration of his biographers, seemed reluctant to acknowledge his sources and debts, Leibniz does not fail to provide an encomium of Suárez. The polymath tells his readers that, as a youth, he devoured Suárez like a novel (Pereira 2007, p. 27). In fact, Suárez's claim that the principles of entity are themselves the principles of individuation (*DM* 5.6.1) no doubt helped illuminate a philosophical option that led to Leibniz's famous monadology. The great esteem with which Leibniz held Suárez seemed to have been shared by his pupil Christian Wolff. Throughout Wolff's *Philosophia prima sive ontologia*, several scholastic theses are examined, but Suárez is one of the few scholastics mentioned by name and almost always with appreciation. What seems clear is that, for Wolff, Suárez represents the epitome of scholastic philosophy. When reflecting on the character of being, Wolff argues that the meaning of being is ultimately resolved in terms of essence; what is more, he cites Suárez as having taught the same thing. "Certainly Francisco Suarez of the Society of Jesus, who among the Scholastics, has meditated more profoundly upon metaphysical things, as is agreed upon, [holds] in his *Disputationes metaphysicae*... that the essence of a thing is said to be what is the first, radically and intimate principle of actions and properties that agree with the thing" (Wolff 1962, I 2.3.169). Finally, to the extent that Suárez helped shape Wolff's metaphysics, so would the Jesuit come to define metaphysics as Kant understood and rejected it. As Gilson put it, "Suarez begot Wolff" (Gilson 1956, p. 112), to which it could be added without too much exaggeration, and Wolff begot Kant. In short, one could argue, with great qualification and nuance of course but no less accurately, that Suárez begot not only Wolff but – as Heidegger has intimated – also modernity and even to a

certain extent postmodernity. Heidegger writes, “With the peculiar character which the Scholastics give it, Greek ontology has, in its essentials, travelled the path that leads through the *Disputationes metaphysicae* of Suarez to the ‘metaphysics’ and transcendental philosophy of modern times, determining even the foundations and the aims of Hegel’s ‘logic’” (Heidegger 1962, pp. 43–44).

As remarkable as his philosophical achievements and the lasting influence he has had on the history of philosophy are, what is more remarkable is the radical contingency of it all. That is, it is difficult to imagine how philosophy would have been reshaped had Suárez remained a reject of the Society of Jesus and not given the opportunity to become, and not only for scholasticism (one may justly argue), the *Doctor Eximius*.

Subiectum/Obiectum

► Subject/Object, Renaissance Concept of

Subject/Object, Renaissance Concept of

Riccardo Pozzo

Department of Humanities and Social Sciences, Cultural Heritage, Consiglio Nazionale delle Ricerche, Rome, Italy

Abstract

The pair of concepts subject/object derives from the Greek **hypokeímenon** and **antikeímenon** and from medieval usages of the verbs *subiicio* and *obiicio*, which actually mean the opposite of their post-Cartesian usages.

Synonyms

Hypokeímenon/antikeímenon; **Soggetto/oggetto**; **Subiectum/obiectum**; **Subjekt/objekt**; **Sujet/objet**

Introduction

The couple of concepts subject/object involves philosophical approaches that are relevant to the

intertwinement of logic, metaphysics, ethics, and psychology (Kobusch 1984; Karskens et al. 1998; Kible et al. 1998). During the Renaissance, some major contributions were proposed by the Aquinas commentator Tommaso de Vio Cardinal Cajetan, the humanist Petrus Ramus, the pure Aristotelian Cornelius Martini, the semi-Ramist Bartholomaeus Keckermann, and the lexicographer Rudolf Goclenius. Mostly, however, the discussion was led by Ramus and his followers, the Ramists, because of the role they played in exacerbating a discussion on the constitution of objectivity that was to have an impact on Cartesian and post-Cartesian theories of subjectivity. Finally, keeping in mind that Kant was familiar with the *secunda Petri*, i.e., with the second part of Ramus's logic, namely, the theory of judgment, some common ground is recognizable on subject/object between Ramus and Kant as well. Decades and decades before Descartes, the issue of subjectivity arose as a consequence of the setting of domains of objects, which brought the momentous change that logic's foundations were not in nature (as Plato and the Stoics assumed), but as a habit, within a thinking subject. Subject/object is about three questions: (1) Is logic a system based on nature or is it in the human understanding as a habit? (2) What are the form and the matter of the object to be considered? (3) How does the human subject elaborate semantic models in accordance with the heuristic of each science (Pozzo 2012)?

Etymology. The concepts derive from the Greek **hypokeímenon** and **antikeímenon** and from medieval usages of the verbs *subiicio* and *obiicio*, which actually mean the opposite of their post-Cartesian usages (Risse 1963). The former refers to the logical discernment of the intellect and the latter to the investigative activity of the senses. In other words, the former designates what we today call a formal approach and the latter is close to what we call today the subjective conditions of experience. Several studies have investigated the history of this pair of concepts, and scholars have become again familiar with the pre-Cartesian understanding of the terms. There is still much to be considered, however, about the motives that led Renaissance philosophers to switch from the Aristotelian notion of a logical

or metaphysical subject to the Renaissance idea of a human subject who aims at using reason in the most consequential way (Pozzo 2002). Finally, it needs to be kept in mind that we are looking into the works of sixteenth- and seventeenth-century philosophers who talked of concepts instead of terms, of judgments instead of propositions, and of reasoning instead of arguments. They were philosophers who openly relied on psychology and, less openly, but just as effectively, on metaphysics (Easton 1997, i). A subject is what accidents subject to and is grasped by the intellect. An object is what one looks at and is felt by the senses. One has first to deal with the subject rather than with the accidents, because the accidents presuppose the subject. As a matter of fact, nothing is without subject, and the subject is either what the accident is in or that upon which the accident falls or inheres. Aristotle teaches in *Categories* 1a20-1b7 that something is either referentially (*de re*) in the subject (**en hupokeímenon**, *in subiecto*), in which case the predicate is in an individual subject, or something is said attributively (*de dicto*) upon the subject (**kath' hypokeímenon**, *de subiecto*), in which case the predicate is said to be of whatever substance is its subject. In the latter case, what matters is that a human being has posed a question and that his or her subjectivity has the responsibility of isolating a determinate domain. The task of providing attributive predication was taken over in the Renaissance by the operator **thema**, a characteristic feature of humanistic logic, which turns out to be pivotal for understanding the constitution of objects. In fact, it is up to the human subject to focus on domains of objects and to thematize them according to his or her operative conditions (Pozzo 1999).

Heritage and Rupture with the Tradition

The opposition of subject/object concerns intentional semantics. It focuses on the question of how we approach the subject we are speaking about or referring to (Hintikka 1975; Jardine 1988; Popkin 1988). In his *De natura logicae*, which appeared in 1578, Jacopo Zabarella gave a new interpretation of the question about the

subject of logic and of the individual sciences by connecting semantics with the epistemic questions related to the completeness of Aristotle's five intellectual habits. His goal is to formulate a general model for the semantics of a complete system of the sciences (Zabarella 1597). The particular logical theories to be presupposed here are abstraction and reduplication. The problem of the *subiectum* becomes relevant in traditional and in humanistic logic in connection with the task of providing a renewed approach to science based on the triad of *res significata*, *discursus*, and *conceptus* (Ashworth 1974, pp. 42–49). Gabriel Nuchelmans has referred to some occurrences of *modus concipiendi* in Arnauld and of *modus considerandi* in Leibniz (Nuchelmans 1982, pp. 74, 224) and Massimo Mugnai to occurrences of *modus concipiendi* in Leibniz (Mugnai 1979, p. 85), thus indicating to the later history of this problem up to Kant.

The following is the text by Zabarella in *De natura logicae* I,15 that constitutes the basis of the discussion:

In fact the subject of a science has two parts: one namely matter, which is called the thing considered *subiectum* [*res considerata*], the other form, which is said ratio and mode of consideration [*modus considerandi*]; the thing considered is not proper to some science, but can be common with others; the mode of consideration however is proper and it restricts the thing considered, which was for itself common: e.g., in operative disciplines we use to name the subject in as far as it is restricted by the goal: so we say that in the medical art the subject is the human body in as far as it must be healed; we see then that the subject of an operative discipline is the same thing considered in the contemplative discipline, and the goal of the operative discipline corresponds to the mode of consideration of the contemplative discipline according to a certain proportion; with which similarity however a dissimilarity is connected: for that mode of consideration in the medical art is not a determinate thing that exists and that is proposed for consideration; it signifies instead something that do not exist, which is proposed to be effected: for this reason we do not speak correctly when we say that the subject of the medical art is the human being in as far as it must be healed, almost as it were constituted by two parts, namely by matter and form; correctly speaking the former is called subject, i.e., the human body, the latter not subject, but rather goal. (Zabarella 1597, pp. 39–40)

Determination and Reflection. Looking at dictionary entries on determination and reflection from the Greeks to Spinoza, one cannot fail to mention Aristotle's description of the role played by **próthesis** in *Analytica posteriora* Alpha 27 in the passage “from the unity, which is a substance without position, to the point, which is a unity with a position: this passage is the result of a determination” (87a34–36). Reflection, instead, does not occur in Aristotle. It does not occur in any Greek thinker – and in fact, in the *Differenzschrift*, Hegel declares he was wondering what the ancient philosophers ever thought in terms of consciousness (GW 5: 11). It is true that in *De anima* Gamma 3, Aristotle admits that the “intellect can think itself” (429b9), but he leaves it there, so that one has to wait until Aquinas for an elaboration of the matter. In the *Summa theologiae*, Aquinas observes that since “the intellect reflects upon itself, by such reflection it understands both its own act of understanding, and the species by which it understands. Thus the intelligible species is secondarily that which is understood; but that which is primarily understood is the thing, of which the species is a likeness” (Pars I, Quaest. 85, Art. 2). The modern understanding of reflection goes back to Locke's *Essay*. Locke writes, “the second fountain from which experience furnisheth the understanding with *ideas* is the *perception of the operations of our own minds within us*, as it is employed about the *ideas* it has got: which operation... I call... *reflection*, the *ideas* it affords being such only as the mind gets by reflecting on its own operations within itself” (Book II, ch. 1, § 4). But it is Spinoza's connection of determination and reflection with negation that attracts our attention, as it attracted that of Kant, Schelling, and Hegel. In the letter of June 2, 1674 to Jarich Jelles (no. 50), Spinoza talks about conceiving geometric shapes as negations, not as positions, because as long as one considers matter indefinitely, matter cannot have any shape. Shapes can take place only in finite and determinate bodies. Given “that a shape is determination,” he argues, and given “that all determination is negation (*omnis determinatio est negatio*), it follows that a shape is nothing but a negation” (W 5: 121). Thus, every position of a new note to the list of intensions, i.e., every

position of the list of properties contained by a concept, implies (in accordance with the theorem of Port Royal about the inverse proportionality of the intension and extension of a concept) that in consequence of a determination, the concept is negated of some of the extensions, i.e., of some of the objects of which it used to be affirmed. In the *Ethica*, Spinoza introduces determination in terms of causal efficiency (*a Deo determinatur*; E1 P27–28), while whatever we conceive to be in the power of God (*a Deo concipitur*) necessarily exists (E1 P35).

Innovative and Original Aspects

The question is whether or not one is entitled to translate the Greek term *sképsis* (from *sképtomai* or *episképtomai*) in the first line of *Analytica Priora* Alpha 1 (24a10) with the Latin *consideratio*. In fact, *Metaphysica* Alpha elatton 3 (995a14) provides the syntagm *trópos epistémēs*, whose Latin translation with *modus cognoscendi* has a large diffusion in the eighteenth century due to Christian Wolff's interpretation of the cognitive difference between *forma* and *materia*. When introducing the distinction between *res* and *modus considerandi*, Zabarella explicitly refers to *Analytica Priora*, to *Ethica Nicomachea*, and to Averroes in *Analytica Posteriora* (Zabarella 1597, pp. 38–39).

Averroes. The most important source for *modus considerandi* is indeed to be found in a passage in Averroes' commentary of *Aristotelis... Posteriorum Resolutorium Libri Duo: Cum Averrois... Magnis Commentariis*, where the philosopher from Cordoba takes up the example given by Aristotle in *Ethica Nicomachea* Alpha 7 and compares perspective and geometry (1097a20–34). The latter “considers the line insofar as it is a line”; the former “considers instead the line is as far as it is an irradiating line.” In fact, “considering the matter absolutely... is closer to truth,” for “the science that considers its subjects in abstraction of the matter is more certain than the science that is depending on the matter” (Averroes 1562–1574, Vol. I/2: fol. 375B).

Averroes introduces *modus considerandi* in the section in his *Epitome in Libros Logicae Aristotelis* while delving into the distinction between *artes/scientiae universales* and *artes/scientiae particulares* on the basis of the *forma-materia* distinction (Averroes 1562–1574, Vol. I/2b: fol. 59C). Averroes begins with those *artes et scientiae speculativae*, which can be divided according to the universality or particularity of their objects. On the one hand, there can be a “universal art, which considers being absolutely [*quae considerat ens simpliciter*], and whose properties are only those that follow from being, such as plurality and unity, potency and.” On the other hand, there is also a “particular art, which considers being as it is [*quae considerat esse quid sit*] and the properties that follow from its parts, what this thing is, such as natural sciences and the other arts” (Averroes 1562–1574, Vol. I/2b: fol. 60C). Any individual discipline, according to Averroes, can thus be considered in a twofold way, namely, either “according to its subjects” or “according to the difference of *modus considerandi* in them. ... In as far as they differ according to consideration, certain sciences are universal arts, and they are of three parts: metaphysics, logic and rhetoric [*ars primae philosophiae, ars topica, et ars sophistica*]” (Averroes 1562–1574, Vol. I/2b: fol. 60D).

Cajetan. Thomas de Vio, Cardinal Cajetan was the most influential Aquinas commentator of the Renaissance (Vio 1503). For the sake of the argument, I refer to the exposition of Cajetan's theory that something can be in the intellect either *subjective*, or *objective*, or *objective consequenter* provided by Cornelius Martini in his metaphysics course of 1597, which was the first course on metaphysics ever to be held at a German Protestant university (Martini 1597):

In the first mode, subjectively, the intelligible species and the act of understanding are in the intellect, as accidents are in their carrier. In the second mode, which is objectively, the object is directly known by the intellect. In this mode, the thing that is subjectively external is objectively intelligible. When, e.g., a color is offered to vision, the color is subjectively not in vision but in the colored body; it is nonetheless said to be objectively in vision, because it is thrown to vision, insofar as it is in its

perspective. The intelligible thing that is offered to the intellect is the object of a potential cognition, and it is at the same time subjectively in the intellect, although the thing is outside it. In fact, the stone is not in the soul, but rather the species or idea of the stone, as it is given upon the soul. The species is said to be objectively in the intellect insofar as it is thrown to it and the species is thrown to the intellect's potency. The third, inferentially objective mode, is that in which one infers the essence of the thing insofar as it is known by the intellect. Essences, however, are outside reason, for the things do not correspond by their own essence, but rather because they are represented to the intellect, or, in other words, because the intellect reflects about them. This happens, e.g., to the human being when the intellect reflects upon him or her. It is the mind that investigates the correspondence between subjects and predicates, minor and major terms. This correspondence, however, does not lie in the human being itself insofar as it exists in nature, but rather insofar as the intellect is occupied about him or her. So correctly, wrote Cajetan. (Martini 1597, fol. 4r)

Just like Aristotle and Aquinas, Cajetan makes it clear that dealing with objects belongs to the realm of psychology. In fact, "for a given knowable object, there must necessarily be a certain habit, by means of which we can perceive it" (Martini 1604a, th. 12). Cajetan's exposition is connected with what Aristotle says in books Beta and Gamma of *De anima* (especially 424a17-424b20, 427a20-427b27). What is new is the stress on the workings of the mind, which determine the domain of both the subjective and objective modes, while the formal approach of cognition to truth, which used to be all-pervading for Aristotle and Aquinas, is for Cajetan confined to the objectively consequent mode.

Ramus. In his groundbreaking papers on Ramus and Descartes, Wilhelm Risse has pointed out that for Ramus, the principles of logic are known a priori, which means that Ramus relies on the Platonic standpoint that there is an ideal *systema* that provides mankind with necessary and universal truths. This kind of proto-idealism is quite the opposite of the Aristotelian stance that logic is rather a habit of the mind and that its principles are the results of generalizations of experience, just like the principles of any individual sciences (Risse 1960, 1963, 1964). From Ramus on, then, the theory of subjectivity

developed itself into the positions of Descartes and Berkeley (Wilson 1997).

Ramus submitted late scholastic semantics to a sharp critique. His tools were the operator **thema** and the theory of the **tópoi** or *loci*. For Ramus, the spontaneity of the human subject displays itself by means of the operation of making a domain of objects the theme of one's investigation. Philosophical investigation is not based on the experience of the subject, but rather on nature itself, which provides the human subject with eternal and necessary structures (the *loci*), for him to be made a theme of. Already in *Topica* Alpha 1 (100a19-20) Aristotle had explained that the object of an argument depends on the scope of its subject matter, insofar as it argues about every problem that has been proposed. But it was only in the Renaissance that **thema** was used to determine an objective and public content of thought, as opposed to the subjectivity of private ideas and images. In this spirit, Rudolf Agricola identified the object of logic with the discussion "about whatever one can talk of with order and propriety" (Agricola 1526, II, 6, 226). Eventually, however, it was Melanchthon who in his *Compendiaria dialectices ratio* put **thema** at the core of logic, which he defined as "the artifice of speaking orderly and appropriately of whatever theme" (CR 20: 711).

In Ramus's logic, there is no mention of the term *obiectum*, and the same holds for his metaphysics. One can, however, trace back the concept by looking at the *loci* of *subiectum* and *adiunctum* (Ramus 1572, p. 16). The latter is that to which something is subjected to (*subiicitur*); it is the argument, and if the subject is a light one, then the argument is more abundant and frequent (Ramus 1572, p. 18). What Ramus did not address explicitly, the Ramist Friedrich Beurhaus did. Beurhaus admits that his master has obliterated the role played by *obiectum* within the notion of *adiunctum*, which is undoubtedly wrong, and he proposes to configure *obiectum* as a *locus* that works as the exact complement of *subiectum* (Beurhaus 1588, p. 583). In fact:

There is a similarity between subject and object insofar as both exist and are not figments of the imagination. There is an important difference,

however, namely that the object can be effective and the subject cannot. Colors stimulate the eye to see, sounds stimulate the ear to hear, other sensible things stimulate the corresponding senses, and, generally, the things that are thrown stimulate our faculties to act. (Beurhaus 1588, p. 585)

Instead, the subject cannot be the efficient cause of its accidents, because its role reduces itself to merely offering a topical space for arguments. This is because the power by means of which the subjects occupy the accidents cannot be the same as an efficient cause. The subjects do not produce their accidents on the basis of a determinate matter. The subjects offer to the accidents only an occasional power of coming to be, but it is always the accidents that throw (*obiiciunt*) themselves to the intellect (Beurhaus 1588, p. 585). It is consequently not true, as Ramus has maintained, that all sensible things and whatever is proposed for discussion on behalf of their virtues and vices are *subiecta*, while all virtues, vices, and the arts that deal with them are their *adiuncta*. What is true is that “all *obiecta* and *materiae* are related to the corresponding *subiecta*, and cannot be simply identified with the *adjuncta*” (Beurhaus 1588, p. 596).

Zabarella. Zabarella indicates the basis for the distinction between *res considerata* and *modus considerandi rem* in the operations displayed by the scientists when they investigate. Zabarella’s systematization has a quadripartite shape. One has to consider four species of *subiectum*. In fact, “the first is when the subject is taken most amply for whatever thing considered in whatever; second, when it is taken for a subject of demonstration, which have contemplative sciences; third when it is metaphorically understood as a subject while being the goal of an operative faculty, e.g., when we say that health is the subject of medicine; and finally forth when it is taken for a subject of operation, which is properly said of the subject of operative disciplines, such is the human body in medicine and iron in carpenting” (Zabarella 1597, p. 40).

The *prima significatio* does not need any commentary, because one finds it also in everyday language (Zabarella 1597, p. 34). The *secunda significatio* is more determinate and refers to

specific conditions: “subject is taken more properly when not everything that is treated in a certain faculty is called subject, but only what satisfies certain conditions” (Zabarella 1597, p. 34). The separation between theoretical (*speculativae*) and practical (*operativae*) becomes relevant. First, because of the goals to be pursued, “operative disciplines have operation as a goal while speculative disciplines have science as a goal” (Zabarella 1597, p. 34). Second, according to the point of view of the subject. The conditions of the investigation and the scope of its application (*scopus*) apply only to a determinate kind of subjects, “the subject must be necessary being, which is preknown by us and signified by a name; it must have also its proper affections and principles, for the affections are demonstrated of the same by means of its principle” (Zabarella 1597, pp. 34–35). Zabarella calls this occurrence *subiectum demonstrationis (de quo)*. He reminds the reader that it deals only with *contemplatio*:

And no other should be the end of the philosopher that contemplates in such subject but knowing the affections of his subject and the principles, in case they are hidden; the subject of a science can thus be subject of demonstration, i.e., subjects *de quo*, while accidents are demonstrated as soon as they are known; the subject of contemplative sciences is of this kind. (Zabarella 1597, p. 35)

With regard to the *tertia significatio*, Zabarella first calls attention to a misunderstanding. It is true that the subjects of the operative sciences are constituted with regard to the goal (*finis*) to be accomplished by an operation, “Operative disciplines have a subject under a different condition: namely that in some way they can do without a subject, for they do not depend on the subject, they are constituted by the goal, whose generation is required” (Zabarella 1597, p. 35). Also Aristotle states, “art is constituted by its goal, while scientia is constituted by its subject” (Zabarella 1597, p. 35). Unfortunately, Zabarella remarks, it often happens that the goal of an operative discipline is confused with its subject, “in these discipline often the goal is called metaphorically subject; e.g., when we say that health is the subject of the medical art” (Zabarella 1597, p. 35). Therefore, the need to stress that the identification, “the

subject is the goal,” is neither legitimate nor precise, “for beyond their goal these disciplines have a subject that is properly taken and that is distinct from the goal: e.g., the medical art has the human body, *in quo* it aims at effecting or preserving health; so that if we want to speak correctly, we ought to call the human body the subject of the medical art, and we ought to call health not subject, but goal” (Zabarella 1597, p. 35).

The *quarta significatio* defines the *subiectum operationis (in quo)*. This is the actual subject of the *artes*, insofar as one can correctly perceive it without being misguided by the metonymical usage of subject *qua* goal, “such is in the medical art the human body, in the moral discipline the human soul, in the art of carpenting iron or wood” (Zabarella 1597, p. 38). This subject is distinguished from the *subiectum demonstrationis* because “the scope of an operative discipline is not knowing, it is operating; i.e., its subject is not proposed for knowing, it is proposed for operating, so that a certain form is generated in it, which is the goal of the discipline, e.g., the moral philosopher generated virtue in the human soul, the physician health in the human body, the smith the form of the key in the iron” (Zabarella 1597, p. 38).

The subject of a *scientia* or *ars* can be defined insofar as its application or scope (*scopus*) is distinctive and with it, the conditions which we must observe before treating it: “the scope of contemplative sciences is the perfect cognition of the proposed subject, which makes it possible that all its principles and its proper accidents be known without gaps; while the scope of operative discipline is not knowing, it is operating” (Zabarella 1597, p. 38). Zabarella concedes however “there is a certain similarity between the subject of science and that of an operative discipline” (Zabarella 1597, p. 39).

These explanations permit Zabarella to generalize his theory so that the twofold point of view of *res* and *modus considerandi* can be applied to every discipline. From a systematic point of view, the complementarity involved in any *scientia* or *ars* is expressed by the following formula: “the subject that sciences have we call the subject of demonstration, or *subiectum de quo*: of which

even the affections are demonstrated in accordance with principles; the subject of operative disciplines we call instead subject of operation or *subiectum in quo*; for in it one operates and something is brought to effect” (Zabarella 1597, p. 40). For an example, Zabarella recalls the distinction between logic and philosophy, because it can be explained following the criterion of *forma* and *materia*, “according to which distinction the logician discords from the philosopher in considering things” (Zabarella 1597, p. 48). The problem of the distinction of logic from other disciplines with regard to *forma* is summarized by Zabarella with the help of a formula taken from Averroes, “all things are the subject of both philosophy and logic, although in different modes” (Zabarella 1597, p. 49). This enables Zabarella to accomplish a fundamental determination of the subject of logic, which is threefold: (1) *in quo*, according to the nature of logic’s own instruments, i.e., concepts of concepts; (2) *ex fine*, according to its goal, i.e., the knowledge of things; and (3) *de quo, ex scopo*, according to the peculiarity of logic’s own *modus considerandi*” (Zabarella 1597, p. 50).

Ramism. Another Ramist, Anton Nothold, took a stance on subjectivity. Nothold charged the Aristotelians – he addressed himself first and foremost against Martini – of psychologism. He maintained that the respect shown by the Aristotelians for objectivity is an inadmissible hypostasis:

Either concepts are simple, if they are grasped without composition and division, or they are complex. Complex concepts are called propositions. If true, propositions have grounding in the things, and are caused by the things. At the same time, they are in the soul. How? Subjectively. For it is clear that no composition and division of concepts can take place outside the intellect. (Nothold 1597, fol. D6v-D7r)

Against the Aristotelian notion that the first intentions are concepts or images of the actual things, Nothold objects that if one accepts that the first intentions correspond to the things themselves, the status of the second intentions poses irresolvable problems. Would the second intentions correspond to the things only after a while? Or would they correspond outside the intellect,

given that the first intentions correspond inside it? Or would they not correspond to the things at all? The expressions “first intention” and “second intention” are a convenient way of distinguishing, e.g., what the predicable genus “animal” is from what an animal is. We first observe that there are animals of different kinds and that “animal” can be said of them all and that while a horse is an animal, we do not say that an animal is a horse – rather that some animal is a horse – nor do we say that “horse” is this particular one. In this way, we notice that our mind has related one thing to many in a special way. This is how we come to know in a reflexive way what a predicable genus is. What animal is – however vaguely known – a first intention, but the particular type of relation our mind conceives as we predicate it of different kinds is a second intention. Moreover, the Aristotelians maintain that the *formalitas* of a concept inheres immediately to the things themselves. But, Nothold observes, taking a hint from Ramus, it is not clear whether this holds for both first and second intentions. In fact, Ramus had refused to distinguish between *notiones primae* and *secundae* (Risse 1960, p. 49). Would first intentions inhere immediately and second intentions only mediately? Or would second intentions not inhere at all? These are the doubts that the Aristotelian position leaves the reader with (Nothold 1598, pp. 19–20). The distinction between first and second intentions is not only useless, it is wrong. The Aristotelians contradict themselves when they maintain that the first intentions are not the product of our mind while the second intentions are such, because the former would not receive existence from the mind. Granted that every concept is neither a first nor a second intention, then, there is no more need to rely on experience. The time has come, concludes Nothold, to abandon the Aristotelian theory of concepts and switch to Ramus’s proto-idealism.

Severin Sluter summarized the point of view of the Ramists: “the subject of all philosophical disciplines dealing with what is and inheres formally is the human mind” (Sluter 1610, th. 107). For Ramus and the Ramists, the accidents come to the human mind on behalf of the mind’s own powers. The mind is ready to know the accidents, not

insofar as they come to it from experience, but rather insofar as they are part of what the mind knows innately. In a word, Ramus and the Ramists stress the spontaneity of the mind when acquiring cognitions, while the Aristotelians stress the receptivity of the human subject.

Impact and Legacy

Aristotelianism. Against the Ramists, the Aristotelian Cornelius Martini claimed that the constitution of an object takes place by means of abstraction, not of thematization:

Whenever we conceive something that is thrown to our intellect, we first grasp it as something we can define as a whole, although it is still confused. . . . Thus, when the intellect apprehends the universal object, it apprehends it first as something definable, but which is still in a confused manner. (Martini 1607, th. 9, 49)

Martini maintains that second intentions are *entia rationis*, “for they are given only to reason, and nothing actual corresponds to them outside the intellect” (Martini 1604b, th. 11). Being the result of an operation of the mind, the *ens rationis* is accidental. It cannot be being itself, then, “because being cannot depend from accidents” (Martini 1604b, th. 13). The *ens quatenus est ens reale* is the opposite of this, and it provides the subject matter of metaphysics (Martini 1604b, th. 15). On the other side, the *non ens* cannot be the subject matter of metaphysics “because it is conceived by the intellect accidentally in the same way that the intellect conceives the *ens rationis*” (Martini 1604b, th. 16). For his definition of the subject matter of metaphysics, Martini relies on the Late Scholastic (precisely Scotist) and post-Tridentine (especially Suárezian) distinction between *conceptus formalis et obiectivus*. E. J. Ashworth has written on Descartes’s reception of the Scotist distinction through Pedro de Fonseca and Francisco Suárez (Ashworth 1997). First we know the objective concept of being (*conceptus entis obiectivus*), which is thrown by the things to the mind (*a rebus menti obiectus*) and which is then abstracted into a formal concept inside the mind (Martini 1604b, th. 17):

A formal concept expresses the similarity with the thing itself expressed in the act of the mind by means of which it represents the form... an objective concept expresses the thing itself insofar as it is known by means of a formal concept... For example, when I know a human being, the formal concept is the idea in my mind that expresses the form of the human being, and as such it is an accident of my mind; the objective concepts express instead the human being itself, i.e., the common and universal nature that is present in whomever human beings as it is derived from his or her formal concept. (Martini 1604b, th. 19–21)

In other words, when we grasp a *conceptus realis*, we imply a certain thing be thrown (*obiiciatur*) to the mind and be conceived in it. Such a concept is in the mind subjectively (*subiective*) (Martini 1604b, th. 23).

For Martini, an object is what determines the domain of human cognition, i.e., the scope (*scopus*) of the human mind, while a subject is determined by the way the mind gets hold of being. Metaphysics, says Martini, deals with the *ens quatenus ens*, which is *ens reale* as opposed to the *ens rationis*. The subject matter of metaphysics has being outside the intellect, because its first causes are God, the angels, the heavens, and the elements, which nobody denies to be *ens realia*. Besides, it is produced by an actually effective cause and it is in something subjectively (*subiective*), because the mind's concepts and habits are all formed by means of the intelligible species and the act of intellecting. Finally, metaphysics is a *scientia realis*, because it does not consider anything but actual subject matters. There is no doubt, then, that metaphysics is an objective science of the intellect (*obiectiva intellectus scientia*) (Martini 1605, pp. 15–16).

The subject matter of metaphysics is being, which is a formal concept that is posited in the intellect and becomes subsequently an objective concept in the things in the following threefold way. First, formal concepts are in our intellect “subjectively just like the intelligible species are formally in the intellect.” A formal concept is the idea of the thing itself expressed by an act of the mind, whereby it is always the thing, which constitutes the idea that the mind represents to itself, i.e., the thing itself is thrown to the mind. Second, concepts are in our intellect “objectively, because

the object or the thing itself is known by means of formal concepts.” So, when the color is offered to vision, it is subjectively not in the vision but in the colored body. However, when the color is thrown to the vision and generates a species in it, we say that it inheres to the vision objectively. Therefore, when the intelligible things are offered to our intellect as objects of its intellective potency, the intelligible things are not subjectively in the intellect, but only objectively. It is not necessary to give many examples, because it is easy to see that what is in the things, i.e., what causes my formal concept, i.e., the essence that is the cause of thousands of individuals reunited under one concept, cannot be in the intellect unless insofar as it is thrown to it as the object of its potency. Third, “concepts are in the intellect in an inferentially objective way insofar as they follow from the essence of the thing, i.e., insofar as the thing is thrown to the intellect” (Martini 1622, p. 64).

For Martini and the Aristotelians, the subject is not only the carrier of the accidents; it is also that without which there would not be any accidents; it is what gives them a formal structure. The object is the result of our elaboration on the subject, although the concept of an object, an objective concept, comes about merely by chance. The human subject is thus passive when constituting objectivity, and the principal roles it plays are to host the cognitive process and to support it by means of the intellectual habits.

Interconnections

Keckermann. At the close of the Renaissance, the semi-Ramist Bartholomaeus Keckermann reformulated the discussion on subject and object in the following terms. A “subject” is what accidents subject to. One has first to deal with the subject rather than with the accidents, because the accidents depend on the subject, i.e., “nothing is without subject, and the subject is that against which the accident falls or inheres, i.e., it is what the accident is in,” which is what Aristotle teaches in *Categories* (1a20–21) about something being **en hypokeímenon**, being *in subiecto* (Keckermann 1614, p. 190). Instead, the

Object is what a function of the soul is occupied with. We say that the object of vision is the color or the light and the object of hearing the sound, because vision is occupied with light and colors and hearing with sound. In the same way, a scholar is occupied with the study of languages and of virtuous things, which are his proper object, just like a farmer is occupied with cultivating, plowing, hoeing, and cutting his field. (Keckermann 1614, p. 195)

Keckermann thinks primarily of the Aristotelian use of **hypokeímenon** as *subiectum in quo*. He has, however, also the Ramist position in mind that the subject is not inert and passive, but rather spontaneous and active in specifying settings. This is what connects Keckermann's theory of subjectivity to Descartes. Keckermann does not mention Aristotle's **antikeímenon**, and this is no surprise. In fact, his understanding of objectivity is entirely active. He considers objects to be the result of determinate operations made possible by the faculties of the soul. It is clear that such a notion of objectivity can be constituted only on the basis of an active subjectivity, because nothing is without subject (*nihil sit sine subiecto*), as Keckermann says. Moreover, an object cannot be *in quo*, because it does not rely on an essence of its own. An object can only be *de quo*, i.e., it can be thematized, i.e., it is the effect of a cause to be determined. On this basis, Keckermann proposed a new division of the sciences in *obiectivae* and *directivae*:

The former deal with the things themselves posited in nature insofar as they are thematized by our intellect (like theology, law, medicine, and philosophy), the latter neither deal with the things themselves that are to be known, nor do they inform and perfect the human intellect with the things themselves, they only prepare operations of the intellect while directing and ordering it by means of certain norms and instruments (like arts and skills). (Keckermann 1614, p. 77)

Although he relied on Aristotle for the notions of logical subject and intellectual habits, Keckermann opened up the path toward the full evaluation of the spontaneity of human subjectivity when constituting objects, which was to be achieved by Descartes.

Goclenius. Goclenius's *Lexicon philosophicum*, the first philosophical dictionary ever to be printed, which was published in 1613, presented the pair of

concepts "subject" and "object" in its full complexity. Goclenius distinguished first the *subiectum metaphysicum sive topicum* from the *subiectum axiomaticum*. The former refers to being, "insofar as the subject of predication refers to the external world," the latter to the theory of judgments, "according to which the subject is the carrier of the predicates" (Goclenius 1613, pp. 1086–1087). As regards the *subiectum metaphysicum sive topicum*, Goclenius distinguishes between the *obiectum* as such and the *subiectum pressius acceptum*. The *obiectum* as such, says Goclenius, is the subject matter of psychology, while the *subiectum pressius acceptum* is that of logic. As a *subiectum inhaesionis*, finally, the subject expresses the determinate thing, i.e., its partial concept and the medium of its reception (Goclenius 1613, p. 1087). The *subiectum inhaesionis*, says Goclenius, is the *subiectum quo*, i.e., that in which the accidents are received immediately, while the *subiectum denominationis* is the *subiectum quod*, which is actually the essence that sustains the accidents, because it subsists on its own and not on behalf of others (Goclenius 1613, p. 1087). The pairs of concepts *subiectum denominationis* and *subiectum inhaesionis* or *subiectum quo* and *subiectum quod* correspond to the two methodical ways of analysis and synthesis. The *subiectum quo*, which is a second intention that results from an abstraction, represents the effects, and the *subiectum quod*, which is a concrete and a first intention, the cause. For example, Goclenius indicates one of the divine persons, which is affected as a subject *quod* in a concrete meaning, while the human nature is affected as a subject *quo* in an abstract meaning – in other words, God is affected in His own flesh and is the principle of what the human being feels (Goclenius 1613, p. 1087).

Speaking about the *subiectum topicum et metaphysicum*, Goclenius opposes **hypokeímenon**, *subiectum in specie* and **antikeímenon**, *obiectum*. The **hypokeímenon** can be divided into *ex quo*, *materia/permanens-transiens*, and *in quo*, *recipiens*. The **antikeímenon** depends on how we become aware of a state of affairs. Accordingly, it can be divided into *partiale* and *totale*. The *obiectum partiale* is either *principale* or *minus principale*, while the *obiectum totale* is either

mediatum seu commune vel remotum or propinquum, proprium, i.e., *immediatum* and *adaequatum*. The parts of the *obiectum proprium* are twofold, namely, matter (*res considerata*) and form (*modus considerandi*) (Goclenius 1613, p. 1087). The last one is an epistemic distinction that was conclusively elaborated by the Aristotelian Jacopo Zabarella and found widespread discussion in early modern philosophy until Immanuel Kant (Zabarella 1597, pp. 39–40). Goclenius's composition of the approaches of Ramus and Zabarella is the proof that the analysis of an object requires the epistemic distinction between *res* and *modus considerandi*. Goclenius is clear that *obiectum* does not belong to logic, but rather to psychology. Consequently, he requires that an acting subject carry out a thematization of a domain of objects. For Goclenius, "*Thema* is a position" (Goclenius 1613, p. 1131).

Descartes. The Ramist position had a fallout on Descartes's understanding of the workings of the mind. In fact, one can say that Descartes's distance from Aristotle was due at least in part to the impact of Ramus and especially of Ramus's idea that scientific method ought to be freed from the distinction between first and second intentions and thus from the requirement of being connected with experience. For Ramus, science does not consist of a series of progressive abstractions, but rather of a series of formally derived propositions that can be defined with clarity and divided with distinction; and scientific cognition must be based on universal and necessary, homogeneous and reciprocally convertible concepts. This, reminds Risse, is exactly what Descartes was eventually going to formulate in his four rules of method: (1) to accept nothing as true which one is not aware of being so; (2) to divide every question with sufficient precision; (3) to carry out one's reflections by proceeding from the standpoint of cognition, i.e., to go from simple to complex concepts, while avoiding the standpoint of the thing itself, which goes from what is elementary to what is derived; and (4) to review that nothing has been omitted (AT 6: 18). Ramus, says Risse, provided for Descartes's first rule when he maintained that logic should not limit itself to the proof of objective truths and rather extend to

the proof of the consequentiality of methodical procedures. Rationality, in a word, has intelligibility as its domain, not actuality, because only the intellect determines what is thinkable and because scientific cognition is the product of clarity and distinction (Ramus 1570, p. 157). The second rule is contained in Ramus's principle of logical division. The third is implied in the maxim of methodical order, and the fourth derives from Ramus's idea that the universality of a concept is a guarantee of the completeness of its extension (Risse 1963, pp. 280–282).

Burgersdijk. There is some probability that Descartes, concludes Risse, knew Ramus, at least through the mediation of Ramists such as first and foremost Franco Burgersdijk. With Ramus had begun that "subjectification" of logic, which Descartes was going to accomplish (Risse 1963, pp. 281–283). For Burgersdijk, exactly as for Ramus and Descartes, the object of a definition is not the objective data on the essence of the thing, but rather its conceptual illumination; the object of a division is not factual diversity, but rather our subjective ability to distinguish; the object of an argument is not formal consequentiality, but rather the material elimination of our ignorance; and the object of method is not a systematic order, but rather the systematic elimination of disorder (Burgersdijk 1626, p. 4; Risse 1963, p. 284).

Kant. In conclusion, a word on the role played by Renaissance philosophers on Kant. The philosopher from Königsberg was a product of eighteenth-century German scholastic philosophy, which was a curious blend of Aristotelianism, Cartesianism, Lockeanism, and Leibnizianism (Kuehn 1997). With him, the issue of subjectivity became centered on a transcendental theory of consciousness (Kitcher 1997). Without doubt, Kant had the Aristotelian distinction between *hypokeímenon* and *antikeímenon* in mind, when he specified that "objects are given to us by means of sensibility, and sensibility alone affords us intuitions; but objects can be thought only through the intellect, and from it arise concepts" (KrV B33). He did not go as far as to say that concepts are in the intellect subjectively, though, because he needed to keep

the word for phrases such as space and time being the “subjective conditions” of all outer appearances (KrV B42, B52), which, in a way, is close to the position maintained by Martini. On the other side, Kant’s notion of objectivity is in agreement with the stress on spontaneity made by the Ramists. In fact, Kant used *thema* as well, which for him means so much as the setting (*positio*) of a *thesis*, which eventually takes the form of a *Satz* (*propositio*) (AA 8: 193–194). Lastly, Kant knew Ramus, if not directly, for much of hearsay. In a passage reported in the *Logik Philippi* (a students’ notebook from 1772), Kant mentioned that:

Ramus began by declaring war against Aristotle in Paris. He proposed a dissertation in which he intended to contradict every proposition Aristotle had said. In this way he eliminated the blind and servile tyranny of Aristotelianism and awakened the spirits out of their lethargy. He wrote a logic whose first part dealt with *de inventione*, the second *de iudicio*. (From Ramus originates the way of saying that one is in lack of *secunda Petri*, i.e., which one is in lack of judgment.) (AA 24: 337)

Abstract

In early modern thought, the sublime is a great or noble quality of literature or art, which is characterized by an irresistible and overwhelming effect and which produces strong and often conflicting emotions such as awe, fear, and admiration in its recipients. From the mid-sixteenth century onwards, a growing interest in Pseudo-Longinus' Greek treatise *Peri hypsous (On the Sublime)* emerged throughout Europe. The sublime as described by Longinus had an inherently dual nature: it could be seen as a type of style with corresponding stylistic devices and prescripts, as well as a ravishing and transporting effect, which emerges from genius and defies the rules of style. In the course of the seventeenth century, the latter interpretation of the Longinian sublime gained the upper hand and fuelled debates on the effects of literature, and later also of art, architecture, music, and spectacle. Besides Longinus' theory of sublimity, the early modern sublime was also shaped by the religious notion of *sacer horror*, the natural philosophy of Lucretius and Pascal's idea of infinity, and operated in a web of neighboring concepts such as *magnificence*, *le merveilleux*, *la meraviglia*, and *le je ne sais quoi*.

Heritage and Rupture with the Tradition

The Sublime from Antiquity to Early Modernity

In ancient literary theory, “the sublime” or “sublimity” (Greek: *hypsos*; Latin: *sublimitas*; literally “height” or “elevation”) is a metaphor that denotes a departure from normal or regular speech to a heightened or extraordinary level (Porter 2016). It is identified as a stylistic category and/or as the aesthetic experience arising from literary or natural greatness (Till 2006).

Sublimity or grandeur as a stylistic category is formalized in theoretical discussions about the various types of style (Greek: *charaktêres tês léxeōs*; Latin: *genera dicendi*), such as can be found in Aristotle’s *Rhetoric*, Pseudo-Demetrius’ *On style*, the *Rhetoric to Herennius*, Cicero’s *De Oratore*, *Brutus* and *Orator*, and Hermogenes’ *On types of style* (Quadlbauer 1958). Early modern rhetorical works, such as Gerardus Joannes Vossius’ *Commentariorum rhetoricorum libri sex* (1606) generally used a threefold division of a high, middle, and low style as their main framework and harmonized systems that discerned more than three styles with the tripartite system (Till 2006).

The sublime as an aesthetic experience is most commonly associated with Pseudo-Longinus’ treatise *Peri hypsous* (*On the Sublime*), written in the first or third century AD. The work describes how sublimity in writing can be achieved through elevated subject matter as well as dignified expression. In this respect, it largely conforms to other discussions of the highest style in writing, and hence early modern scholars often regarded the treatise as a discussion of the “high style” in a system of multiple styles (Till 2006; Huss 2011). In the course of the seventeenth century, scholarly interest however shifted to other aspects of Longinus’ theory, which would eventually come to dominate the interpretation of the treatise in later periods (Porter 2016; Jansen 2016). Longinus’ insistence that “greatness of thought” is the most important prerequisite for sublimity (*Peri hypsous* 9), his emphasis on the sublime effect (*Peri hypsous* 1 and 15), his approval of the outbursts of genius, even if erratic

(*Peri hypsous* 33–36), and his descriptions of awe-inspiring natural phenomena (*Peri hypsous* 35) engendered the construction of an idea of sublimity that transcends matters of literary or rhetorical style, and which is a matter of subjective experience rather than stylistic normativity (Kerslake 2000; Delehanty 2005; Till 2006; Eck et al. 2012; Porter 2016).

Other Sources of the Early Modern Sublime

The sublime as an independent aesthetic concept was not just shaped by Pseudo-Longinus’ treatise *Peri hypsous*. Notions of the sublime also played a role in ancient natural philosophy and Christian doctrine and were implicitly used in tragedy and epic. In his *De rerum natura* (*On the Nature of Things*), the Roman philosopher Lucretius (99–55 BC) for instance thematized the material sublime (*maiestas rerum*, “the greatness of things”) by reflecting on natural phenomena such as storms, volcanic eruptions, and earthquakes. The primordial fear of cosmic infinity that is central to Lucretius’ natural philosophy is essentially a portrayal of the overwhelming effects of sublime phenomena on the human mind (Porter 2007; Porter 2016). Another type of sublimity was developed in the tragedies of the Roman playwright Seneca. His bloodthirsty horrors and monstrous personages raise overwhelming feelings of abomination and played an important role in early modern tragedy from the mid-sixteenth century onwards (Langdon 2012; Gunderson 2015).

The ancient and early modern idea of the sublime moreover bears a moral dimension, as is exemplified by the reflections on the antithesis between sublimity and humility in for instance Ovid’s *Metamorphoses* and most importantly in the writings of Augustine. In the story of Phaeton (*Metamorphoses* 2.1–339), Ovid problematizes the relation between *sublimis* and *humilis* by confronting the deep human longing to be elevated above earthly pursuits with the impossibility to become part of the elevated world of the Olympians, which in the case of Phaeton eventually leads to disaster. Phaeton’s story inspired many early modern writers: Dante in *Divina Comœdia*, Shakespeare in *Richard II*, Vondel

and Lully/Quinault in their respective play and opera *Faëton/Phaeton* used the story to contrast the human craving for sublimity with the humble constitution of man (Brownlee 1984; Merrix 1987; Scott 1994; Bussels 2016). In Augustine's works, the contrast between *sublimis* and *humilis* refers to the magnificence of God and the humble constitution of man, especially in his *Soliloquies* (Michel 1986; Martin 2012). In *De doctrina Christiana*, Augustine reflects on the paradoxical "sublime simplicity" of scripture, which springs from the fact that its subject matter is elevated while its language is often very simple, thus departing from the traditional rules of ancient rhetoric (Shuger 1988). Eventually, throughout the whole Christian world "the sublime" became a synonym for the sacred with, among other examples, *Sublimis Deus* in the title of the famous papal bull of 1537 that forbade the enslavement of the Indians, in which God's infinite, sublime love for the human race is emphasized (Prien 2017). God's sublimity moreover manifests itself in his wonders, which go far beyond human understanding and inspire awe and fear similarly. The divine wonders, as well as their worldly counterparts, the seven ancient Wonders of the World, became a standard reference point in discussions of the overwhelming feeling of ecstasy that results from beholding magnificence (Otto 1980; Clayton and Price 1988; Daston and Park 1998).

The Sublime up to 1674

For a long time, it has been assumed that Longinus and his idea of the sublime appeared on the stage of modern criticism only after Nicolas Boileau's canonical French translation of *Peri hypsous*, titled *Le traité de sublime, ou du merveilleux dans le discours* (Paris, 1674). In the preface to this translation, Boileau had stated that the sublime is not to be understood as the sublime style (*le stile sublime*) but as an extraordinary quality of discourse that can even be found in simple phrases (Adam and Escal 1966). Furthermore, as a result of Boileau's (polemical) exchanges with some of his contemporaries Longinus' quotation of the Biblical *fiat lux* became the key example of "sublime simplicity" in the late

seventeenth-century debate on the nature of the sublime (Declercq 1994). Although Boileau's writings certainly left a mark on the early modern interpretation of Longinus' treatise and the development of the concept of the sublime (Brody 1958; Doran 2015), the early modern engagement with Longinus and the sublime already started much earlier (Fumaroli 1996). Early seventeenth-century scholars, such as Daniel Heinsius, Jean Chapelain, Jean-Louis Guez de Balzac, Tanneguy Le Fèvre, John Milton, and Thomas Blount, already reckoned that the sublime, besides its usage as the highest category (*genus sublime*) in the stylistic hierarchy of the *genera dicendi* in rhetorical theory, could also be understood as an independent concept that pointed at the ravishing and transporting effects of discourse (see, e.g., Brody 1958; Hache 2000; Norbrook 1999; Cronk 2002; Jansen 2016; Gilby 2016). Moreover, the idea that the sublime is less about style than about the effects of discourse led to the association of the sublime with the unbridled outbursts of genius. Parts of Longinus' treatise could be read as an argument that sublimity might be reached by ignoring or transgressing poetical and rhetorical rules (Bussels et al. 2016; Jansen 2016). Against the backdrop of the widespread neo-Aristotelian emphasis on rules for the creation of literature and art, Longinus appeared throughout the seventeenth century as a major reference point in defending the importance of natural talent in the creation of truly great literature (Fumaroli 1996).

Innovative and Original Aspects

The Sublime in Different Media and Fields

Although Longinus and many of his commentators describe the sublime as an effect of discourse, the early modern use of the concept is not necessarily limited to the domain of literature or speech alone. Recent scholarship has elucidated early modern applications of the sublime to the visual arts, music, performing arts, as well as its use in the fields of religion, science, and in the experience of nature (Gilby 2006; Martin 2012;

Costelloe 2012; Van Eck et al. 2012; Van Oostveldt and Bussels 2016; Bussels and Van Oostveldt 2017). The terminology of the sublime for instance found its way in art theoretical works, such as Franciscus Junius' *De pictura veterum* (1637), which influenced many contemporary and later theoreticians throughout Europe (Weststeijn 2015; Nativel 2016). Musical metaphors in Longinus' treatise were interpreted within the framework of early modern musical theory, such as in Leone Allacci's *De erroribus magnorum virorum in dicendo* (1635) (Refini 2012). Claude François Ménéstrier's *Des représentations en musique anciennes et modernes* (1682) referred to Longinus in the discussion of the effects of spectacles (Bussels and Van Oostveldt 2017). In religious thought, a profound engagement with the sublime can be discerned in the interaction between the term *sublimis* and the idea of *sacer horror* in late sixteenth-century Jesuit writings (Melion 2016; Dekoninck and Delfosse 2016). For science and the experience of nature, Pascal's notion of the infinity of the universe or Dominique Bouhours' Lucretian inspired experience of the sea are likely candidates to be included in a discussion on the sublime in early modernity (Cronk 2002). Recent scholarship even discerns sublime "sensitivities" in artistic practices such as in the paintings of Poussin, Rembrandt or Allaert van Everdingen, in Bernini's sculptures, or in the construction of large public buildings such as the Amsterdam Town Hall or the colonnade of the Louvre (Nau 2005; Delbeke 2012; Weststeijn 2016; Sheers Seidenstein 2016; Blanc 2016).

The Sublime and Neighboring Concepts

Whether in early modern poetics, in the visual arts, musical theory, or the performing arts, the sublime does not operate as a strictly codified concept, which exclusively derives its theoretical foundation from Longinus' treatise *Peri hypsous*. In early modern thought, the sublime is rather a floating concept, which often operates within a wider network of other, "neighboring" concepts, such as the French idea of *magnificence*. In the early modern political and iconographical

tradition, *magnificence* is increasingly associated with the elevated status and imposing quality of royalty. In a mid-seventeenth-century French translation of Longinus' treatise, the term *magnificence* is used as a synonym for the sublime, giving the sublime a political undertone that suggests the enormous and overwhelming power of royal sovereignty (Gilby 2007; Martin 2012). The inexplicable character of the sublime as the product of natural genius runs parallel with seventeenth-century discussions of *le je ne sais quoi* in French criticism, as for instance in Dominique Bouhours' *Les entretiens d'Ariste et d'Eugène* (1671) (Scholar 2010). The astonishing effect of the sublime tunes in with early modern discussions of *le merveilleux* and *meraviglia* in the arts and even the sciences (Daston and Park 1998). To understand the history of and the impact of the sublime in early modern thought, one should acknowledge those varieties in the meanings and scope of the concept. A close look at how the sublime operates within a larger semantic field and how it "travels" from domain to domain may well open up unexpected connections and questions for future research.

► Subject/Object, Renaissance Concept of

Symmetry in Renaissance Art

Michael Selzer

Colorado Springs, CO, USA

Abstract

Although many scholars suppose that the concept of bilateral symmetry was known in Classical times, the earliest evidence of it does not appear before the second half of the fifteenth century: it is a concept that originated in the Italian Renaissance. From the outset it was not only a descriptive concept but a normative one, which asserted that to be beautiful a design must be symmetric. The only person during the Renaissance known to have offered a rationale for this norm was L. B. Alberti, who claimed that Nature’s forms are symmetric and that the Ancients, recognizing as much, saw to it that their artifacts and buildings were always given symmetric shape. These claims (whether original to Alberti or not is unclear) would prove to be immensely influential and durable and are the origin, not only of the preponderance of symmetrical architecture, but of tenacious scientific fallacies such as the alleged symmetry of snowflakes and other crystals.

Symmetry

The concept of shapes whose left and right halves mirror each other – unknown in Classical and medieval times – had its origins in the early Italian Renaissance (Selzer 2016, pp. 41–79; 196–238). The earliest evidence of it is in three works of the latter half of the fifteenth century: Alberti’s *De re aedificatoria*; Pius II’s *Commentarii*; and Colonna’s *Hypnerotomachia Poliphili*. We do not know who first formulated the concept or what train of ideas led to it. The concurrent use of different terms for it may indicate that it sprang from more than one source.

“Symmetry” was one of those terms. In Classical Greek and Latin it meant something like

“pleasing proportions” (e.g., Plutarch 1932, pp. 540–542), and it retained this meaning during the Renaissance (e.g., Wotton 1624, p. 54); so that the one word was used – sometimes in the same book (e.g., [Colonna] 1499, b ii’ and a viii’) – for two unrelated concepts, both in the field of aesthetics. The confusion this engendered continues to our day, with some modern scholars (e.g., Tavernor 1998, p. 43) mistakenly claiming that when Vitruvius, for example, used the term he was referring to symmetry in the modern sense.

The *norm* of symmetry, with which the concept was associated from the outset, prescribed symmetric design for all artifacts, including buildings, on the grounds that only symmetric shapes can be beautiful. This prescription was usually presented as self-evident. Thus Pius II (1984, p. 547), explaining why a fake doorway was placed on a façade of his Pienza palace, declared only that its purpose was *ad servandam simmetrie gratiam*; similarly, Serlio (1584, p. 156) did not elaborate on his statement that an off-centered portal was *molto contrario alla buona architettura*. Others – among them Vasari (1568) and Michelangelo (1875, p. 554), echoed in England by Wotton (1624, p. 117) – limited themselves to citing the purported symmetry of the human body (which in fact is *not* symmetric!)

Leon Battista Alberti thus stands out as the only Renaissance writer known to have formulated a wide-ranging rationale for the symmetry norm. His *collocatio* comprises two elements. One is descriptive and stipulates that the right and left halves of a form mirror each other *exactly*. The other element of *collocatio* is prescriptive. It is based on Alberti’s assertion (Alberti 1966, IX: 7) that it is of the essence of Nature that all the forms she makes are symmetrically shaped (*tam ex natura est ut dextra sinistris omni parilitate correspondeant*). This, Alberti claimed, (*ibid*, IX: 7) had been recognized by the ancient Greeks, who deduced from it the fundamental principle that in works of art and architecture the right must accord with the left (*dextra sinistris convenirent*) even in the minutest details (*in minutissimis*). *Collocatio*, indeed, is a prerequisite of beauty (*ibid*, IX: 5).

These arguments are unpersuasive. As anyone can tell, Nature’s forms are invariably

asymmetric; and the insistence that only symmetric forms are beautiful cannot survive even a moment’s scrutiny. Moreover, there is no literary or linguistic evidence that the concept of bilateral symmetry was known in the Ancient world. Alberti wrote that he had discovered *collocatio* by carefully examining “every building of the ancients, wherever it might be, that has attracted praise” (*ibid*, VI: 1, 3, 6). Implausible in itself, this claim is not helped by the fact that the only ancient structure he cited were the ruined walls of Antium Anzio, about which he tells us merely that they must have been very long.

Separately, Alberti also argued that any combination of two disparate shapes is inherently offensive (*ibid*, IX: 7). We would be repelled, he wrote, by a dog that had one ear like that of a donkey. Whether asymmetric design is usefully characterized by such images may be doubted. Moreover, as he presented it, Alberti’s point is to deplore the asymmetry of the two ears, not the inappropriateness of one of them; which implies that we would not be repelled by the sight of a dog whose two ears were identically shaped like those of a donkey!

We do not know if these arguments were original to Alberti, but their jejune quality has always characterized attempts to rationalize the symmetry norm: for example, the argument of Montesquieu (1825, p.616) that: *la raison que la symetriad plaît à l’âme, c’est qu’elle lui épargne de la peine, qu’elle la soulage, et qu’elle coupe pour ainsi dire l’ouvrage par la moitié*.

Nevertheless the influence of the symmetry norm is undeniable. It accounts among much else for the predominant symmetry of Western architecture since the end of the fifteenth century, for the widespread belief that not just Classical art and architecture but the artifacts of primitive cultures were symmetric, and for such persistent scientific fallacies as the claim that snowflakes and bees’ cells – and indeed the universe itself – are symmetric.

Syphilis in Renaissance Medicine

Abstract

The attack of syphilis in Europe was first reported in July 1495 in connection with the Italian invasion of French King Charles VIII (1470–1498). During the war, many soldiers were contaminated with a new type of disease. As the army of Charles VIII was composed not only of Frenchmen but also of foreign mercenaries, the disease was spread in Italian cities and then in other European towns once those men returned. Going beyond the Alps, syphilis reached France and Switzerland by 1496, England by 1497, and the Northern European countries by 1499 (Quet  l 1986). Because France was regarded as responsible for this calamitous spread of the disease, it was called

“French disease” (*morbus Gallicus*) in most countries and “Neapolitan disease” (*morbus Neapolitanus*) in France.

Synonyms

French disease; Neapolitan disease

Major Aspects

Italian physician Girolamo Fracastoro (1478–1553) wrote a long poem entitled *Syphilis or French Disease* (*Syphilis sive Morbus Gallicus*) (Verona, 1530). In this work, he adopted the name of Syphilis, who was a shepherd contaminated by a sexually transmissible disease in Virgil’s *Georgica* (Fracastoro 1530).

Even before Fracastoro, since the early stage of its diffusion, diverse possible causes were speculated for syphilis. Soon after its mode of transmission was identified with sexual relations, a religious explanation became dominant: the disease was the sign or result of God’s anger against the perverted behaviors of human beings. At the same time, astrological arguments also gained popularity: celestial phenomena such as the conjunction of planets were its causes. A small book written by Joseph Gr  npeck (ca. 1470–1531) about syphilis devoted nine of its ten chapters to the disease’s connection with planetary conjunctions. In his *Prediction on Epidemic Scabies* (*Vaticinium in epidemicam scabiem*) (Nuremberg, 1496), Theodericus Ulsenius (ca. 1460–1508) adopted woodcut engravings by Albrecht D  rer (1471–1528). One of them depicted a man contaminated with syphilis and a heavenly sphere with an inscription of 1484 above him. This meant that the disease was produced by the great conjunction of Mars, Jupiter, and Saturn of that year (Ulsenius 1496).

Following this line of astrological reasoning, Swiss physician Paracelsus (1493/1494–1541) elaborated his complex theory for the cause of syphilis. In his treatise, *On the Origins and Causes of French Disease* (*Vom Ursprung und Herkommen der Franzosen sampt Rezepten Heilung*) (written in 1529), Paracelsus argued that

celestial phenomena were not the sole cause for its appearance. Although its transmission is due to sexual relations, the disease itself was produced by the transformation of the pathogens, which already existed in the human body. These pathogens of an old type of disease were “transmuted” into syphilis by the influence of human perverted imagination and desire as the internal agents and by the power of the planet Venus which governs love and sex as the external agent. Using this idea of the transmutation from an old disease to a new disease, Paracelsus tried to explain the diversity of symptoms (Paracelsus 1922–1933, VII: 183–366; Keil and Daems 1977; Kikuchi-hara 2013).

As the sixteenth century went on, the view that syphilis was brought from America to Europe became dominant. It was because the outbreak of the hitherto unknown disease coincided with the return of the expedition led by Christopher Columbus (1450/1451–1506). According to this view, if Columbus’s crew members had sexual relations with local people contaminated with syphilis, they would be its first European patients. Those contaminated crew members came back to Europe and provoked the secondary contamination, leading to the outbreak of syphilis. Besides the theory of the American origin, there were also other opinions (including the theory of the African origin), which advanced that the disease already existed in Europe before the beginning of commerce with the New World. There had been lively debates on the American origin of syphilis over centuries, namely, at the end of the nineteenth century, when a historian of medicine Karl Sudhoff (1853–1938) used historical evidence to criticize dermatologist Ivan Bloch (1872–1922), who supported the American origin (Quet  l 1986).

As syphilis spread in Europe during the first decades of the sixteenth century, many curing methods were tested while searching for its cause. Among others, the wood of a tropical plant called “guaiac” (*Guaiacum*) gained popularity, as it was believed to be used by Native Americans for skin diseases. Since syphilis also produced skin wounds, the medicine produced from this wood was regarded as its specific cure.

Guaiac was called by diverse names such as “sacred wood” (*lignum sanctum*) and “wood of life” (*lignum vitae*). Although it was unclear when guaiac was first imported to Europe, it was used for syphilis in Spain as early as ca. 1508. Its use was spread all over Europe by the 1520s. The Fugger family of Augsburg contributed much to this wide diffusion. Not only did they have an exclusive right to import guaiac into Germany but also they promoted its use in the hospital they were running (Munger 1949; Arrizabalaga et al. 1997).

The first writings on guaiac appeared in the 1510s. German physician Ulrich von Hutten (1488–1523) wrote a small treatise *On the Guaiac Medicine and French Disease* (*De guaiaci medicina et morbo gallico*) (Mainz, 1519). Hutten, who himself was sickened by syphilis, defended guaiac’s healing power and contributed to its large-scale popularity. His work was a global guidebook on syphilis and guaiac. It aimed to explain not only guaiac’s properties and usage but also syphilis’s nature, origins, symptoms, curing methods, and even prognosis. It was more than a medical treatise since it also reported Hutten’s personal experience of the guaiac remedy as a patient. His book was very successful and was translated into several European languages (Benedeck 1992).

The guaiac remedy started to lose popularity in the second half of the sixteenth century. Despite its sporadic resurgence in the seventeenth century, it totally disappeared from the medical scene in the nineteenth century (Munger 1949). But what explains its vogue during the first decades of the sixteenth century? First, there was a resistance to the abuse of the mercury remedy. Although it was traditionally used by physicians, including Paracelsus, the mercury remedy was dangerous. Patients were confined in a room with a high temperature for many days and weakened by sweating and vomiting (Munger 1949; Quet  l 1986). The guaiac remedy, by contrast, did not provoke as much pain or side effects as the mercury remedy.

Second, the guaiac remedy respected the norms of the orthodox medicine of Hippocratic-

Galenic school. Its efficacy was believed to be at the highest degree if a patient with an empty stomach orally absorbed guaiac rendered in power and diffused in water, while a bad regime of a patient would diminish its efficacy (Munger 1949). A regime based on food restriction was advised, which naturally fit the traditional medical precepts. Although the plant was recorded nowhere in the works of the ancients, the remedy followed a typical perspective adopted in the medical tradition of Europe.

Third, there was the impact of the Age of Discovery and the natural history vogue that followed. With the expansion of commerce with Asia and America, a plethora of rare or unheard-of specimens and goods were brought to Europe. Among those specimens, medicinal plants used by native peoples were most appreciated because they inspired hope for curing diseases hitherto considered to be incurable. Physicians were interested in foreign drugs and medicinal plants and animals, which led to the vogue of natural history, including botany and zoology. The wood of guaiac was closely connected to this gain of interest in exotic products.

Tacitus and Tacitism

Eric MacPhail

French and Italian, Indiana University,
Bloomington, IN, USA

Abstract

Tacitism represents an important phase in the history of classical scholarship and a characteristic feature of Renaissance political thought. The two most prominent representatives of Tacitism are Marc-Antoine Muret and Justus Lipsius, exemplary editors, commentators, professors, and disciples of the Roman historian Cornelius Tacitus (ca. 55–120 AD). Tacitism is sometimes depicted as a sequel to Machiavellism, an updated version of cynicism and dissembling suited to the paranoid atmosphere of Counter-Reformation Europe. It can more properly be thought of as an important philological achievement and a productive literary motif. In fact, Tacitism forms a crucial link between classical scholarship and vernacular literature in the early modern era.

Biography

The Roman historian Cornelius Tacitus was a leading statesman and chronicler of the first century of the Roman principate. Tacitus himself tells us in the prologue to his *Histories* that his public

career or *dignitas* began under Vespasian, continued under Titus, and advanced quite far under Domitian before reaching the fortunate era of Nerva and Trajan (Tacitus 1911, 1). Among the offices he held were the praetorship in 88, membership in the college of priests known as *Quindecimviri*, and finally the proconsulship of Asia for 112–113. In 98 he published his first work, the *Agricola* about Iulius Agricola, governor of Britain, which was followed by the *Germania*, an ethnographic treatise on the tribes of Germany. Under Emperor Trajan, Tacitus began to compile the materials for his *Histories*, and at the end of his life he composed the *Annals*, which chronicle the atrocities of the Julio-Claudian dynasty from Tiberius to Nero. He is thought to have lived into the early years of Hadrian's reign.

Impact and Legacy

Despite the admiration of Pliny the Younger and other contemporaries, Tacitus seems to have enjoyed a rather meager *fortuna* in antiquity and the Middle Ages. His name seems to have survived primarily due to the opprobrium heaped upon it by Tertullian and the Christian tradition until his work was first edited from manuscripts conserved in German monasteries starting in the late fifteenth century. The surviving corpus consists of the following texts: the *Annals* in 16 books (of which books 7 through 10 are missing), the *Histories* in five books, the *Life of Agricola*, the

Germania, and the *Dialogue of the Orators*. All these works were available in print by 1515. Their impact upon Renaissance culture was manifold and immediate. To begin with, the *Germania* “was used to fan the fires of German nationalism” and helped give birth to the myth of German purity and simplicity (Mellor 1995, xxii–xxiii). In his capacity as the author of the *Germania*, Tacitus may even have played a role in fomenting the Reformation as an assertion of German independence from Rome. The *Annals* and the *Histories*, with their lapidary style and memorable portrayal of despotism, became a sort of breviary of European courtiers living in the new age of absolutism. In particular, the portrayal of Emperor Tiberius in the first six books of the *Annals* seemed to epitomize the perverse lesson of deceit and dissembling deemed necessary for survival and advancement at the courts of princes. Francesco Guicciardini testifies to this reputation as early as 1530 in his *Ricordi* where he proclaims, “Tacitus teaches people who live under tyrants how to act prudently, just as he teaches tyrants how to found their tyranny” (Guicciardini 1984, 28: “Insegna molto bene Cornelio Tacito a chi vive sotto a’ tiranni el modo di vivere e governarsi prudentemente, così come insegna a’ tiranni e modi di fondare la tirannide” C18). In this sense, Tacitism denotes the amoral utilitarianism to be derived by unscrupulous opportunists from a lucid and unemotional chronicler of grandiose inhumanity. In the domain of rhetoric, so constitutive of Renaissance culture, the *Dialogue of the Orators* offered the tantalizing possibility of a stylistic alternative to Ciceronianism in the transition from civic humanism to what Marc Fumaroli has called aulic humanism (Fumaroli 2002, 63–70). Tacitus’ *Dialogue* stages a debate over the *optimum genus dicendi* that seems to speak directly to Renaissance readers and that resonates particularly deeply with the tradition of Attic prose studied by Morris Croll (Croll 1966).

The vogue for Tacitean wisdom developed in tandem with work on Tacitus’s texts performed by Renaissance humanists. Circulating fairly widely in manuscript in fifteenth-century Europe, Tacitus reached print in 1470 in an edition prepared by the first Venetian printer Vindelino de Spira. The next

noteworthy edition was prepared by Francesco Puzeolano in Milan beginning in 1475, known as the Puteolanus. In 1515 Filippo Beroaldo the Younger published the complete works of Tacitus in Rome, including the *editio princeps* of books one to six of the *Annals*, based on a ninth-century manuscript conserved in the Laurentian Library in Florence known as *Mediceus primus* or *Mediceus* 68.1. There followed editions by the law professor and inventor of emblem books Andrea Alciato, by Erasmus’ disciple Beatus Rhenanus, and by another law professor Aemilius Ferretus, before Justus Lipsius revolutionized the field with his series of seven editions of Tacitus with commentary starting in 1574. Coinciding with the last of this series, in 1607, Curtius Pichena published a new edition of Tacitus based on careful collation of the *Mediceus* codex conserved in the Laurentian Library, to which he enjoyed privileged access as the secretary to the Grand Duke of Tuscany. In this way, “as the sixteenth century wore on, readers had a better and better text at their disposal” (Schellhase 1976, 15). The diffusion of Tacitus’s work benefited further from the industry of translators, including Giorgio Dati in Italy, Claude Fauchet in France, and Henry Saville in England.

The establishment of a reliable text and apparatus in turn helped to make the study of Tacitus a university discipline beginning as early as 1492 when Conrad Celtis lectured on Tacitus at the University of Ingolstadt. Later Lipsius would deliver an important oration on Tacitus at the University of Jena in 1572 in the course of his spiritual and geographic peregrinations. The decisive moment in the story we are telling arrived in November 1580 when Marc-Antoine Muret inaugurated his lecture course on Tacitus’s *Annals* at La Sapienza in Rome. In his survey of the Tacitist tradition for his Sather Lectures, Arnaldo Momigliano points to Muret’s pivotal role: “We may put the turning point around 1580, when Marc-Antoine Muret started to give lectures on Tacitus’s *Annals* at the University of Rome – the very center of the Counter-Reformation” (Momigliano 1990, 123). Similarly, in his own survey of Tacitism, Peter Burke looks to 1580 as the time when interest in Tacitus “turned into a fashion, a craze, a movement which lasted some 100 years” (Burke 1969, 150). Muret did not exert

his most crucial influence as editor or commentator but rather as public spokesman of the lessons of political prudence taught by the *magister prudentiae*.

On November 3, 1580, Muret inaugurated his course with an epideictic oration in which he praises history above all disciplines, Rome above all nations, and Tacitus above all historians (Muret 1971, 1: 376–382). As the holder of the chair of rhetoric, Muret starts by praising Tacitus for his style:

In the first place let us acknowledge that everyone grants Tacitus the highest praise in writing: never was any writer more prudent or careful; his style is dry and sober, sparing in words and dense in thoughts; nothing superfluous can be detected in his speech, nothing empty, nothing redundant; each word contains a thought. Great praise and such that he can do without others. For just as our most prized possessions are those whose size is small but whose value is great like gold or jewels, and just as the best foods are those with the least waste and the most flavor, so the best speech embraces the most thoughts in the fewest words. That proves that it is born in the mind not the mouth.

Tacitus's preeminence as a writer is confirmed by the celebrity and sagacity of his most prominent readers:

This excellence of style, which among all Latin writers is most evident in Tacitus, is the reason why the wisest men of all ages, led not by the empty sound of words but by the quality of thoughts, have always held Tacitus in great honor and judged his work most useful for princes. As proof I could mention the Emperor Tacitus who had the historian's image and his books collected in all libraries and archives. However, that is an old and obsolete example, and examples so far removed in time carry less persuasive force. Pope Paul III, than whom our age witnessed no wiser senior, wore out his copy of Tacitus with frequent reading. Cosimo dei Medici, the first Grand Duke of Tuscany, a man born to rule, a man who maintained that what the common people call fortune consists in deliberation and prudence, loved Tacitus and profited avidly from reading him. Today many princes as well as those who are consulted by princes in the highest matters of state read him religiously and consider him a teacher of prudence.

Here Muret consecrates Tacitus's role as *magister prudentiae* whose work is a mirror for princes and courtiers alike.

In teaching Tacitus, against considerable institutional resistance, as he explains in his subsequent lecture, Muret is conscious of his own innovative role (and wants to make sure that we are conscious of it too). He has reformed the curriculum, much to the chagrin of those who squandered their youth learning a few eclogues of Virgil or a speech and some measly letters of Cicero. Now it is time to learn something more serious and more profitable. Anybody can teach those scholastic trivialities, he boasts to his audience, but you will not find many teachers willing or able to teach Tacitus. With Muret, Tacitism emerges as a pedagogical reform.

The next day, November 4, Muret delivered the second installment of his inaugural discourse where he responds systematically to the detractors of Tacitus (Muret 1971, 1: 382–392), including, presumably, those Cardinals on the Congregation of the Index who previously had forbidden him to offer a course on Tacitus. We know from a letter of 1572 that Muret had tried and failed to obtain permission to teach Tacitus (Giot 2012, 382), but he persevered until he finally secured the necessary authorization in 1580. There are, Muret reminds us in this new oration, five charges traditionally leveled against his client: Tacitus is the chronicler of tyranny; he is a liar; he hates Christians; his style is difficult; and his Latin is distinctly non-Ciceronian. The first accusation allows Muret to highlight Tacitus's greatest asset: his timeliness in an age of absolutism. Practicing the very prudence that he professes, Muret reminds his audience that they live in neo-Roman times. Gone are the Republics of the past; everyone lives under the arbitrary rule of one. And though, by god's mercy, the current age has no Tiberius, Caligula, or Nero, nevertheless, it is handy to know how good and prudent men managed to live under such rulers without endangering themselves or shamefully approving others' vices. To elicit the pertinent lessons of such conduct requires some particularly torturous logic from the lecturer:

For there are many things about the Prince that a good man, though he cannot praise them, can allow to pass in silence. Those who cannot connive at their rulers' vices expose themselves and their

rulers to danger. For many people, who believe their vices to be hidden, will voluntarily correct them lest they be discovered; and while they still think they are considered good men, will endeavor to become so. Whereas if they see that their vices are obvious, they will openly do what is openly said of them.

At this point, politics and morality have parted ways. The exemplary figure of the *Annals* is Tiberius, and he teaches imperial dissembling:

From the perpetual dissembling of Tiberius, from his expression and speech which displayed everything except what he was thinking, we will learn to behave cautiously with princes and not always to trust their looks or compliments. We will learn to ignore the things which princes wish to keep hidden, regardless of what we actually know, and we will see how not to penetrate deeper into their secrets than they would like us to. . . . Thus, even bad examples will be useful.

In short, Tacitus teaches us to make good use of bad examples, and that ought to keep him in print indefinitely.

Another aspect of Muret's second lecture that merits our attention is his defense of Tacitus's writing style against partisans of Ciceronian Latin. Earlier editors had routinely acknowledged Tacitus's inferior Latinity but had blamed it on the degenerate tastes of his time, as we can see particularly well in the preface to Beatus Rhenanus's edition of 1533 (Ulery 1986, 105). Muret takes a different tack. If Tacitus spoke differently than either Cicero or Caesar, then he must have preferred a different style. If he uses many words and expressions that earlier writers had not used, so what? In effect, Muret restages here the debate in Tacitus's own *Dialogue of the Orators* where Marcus Aper, the *novus homo*, insists that style must change with the times and that whatever is different (from Cicero) is not necessarily worse: "nec statim deterius esse quod diversum est" (Tacitus 1975, 81). This is the motto of historicism, at odds with the strictest classicism (Grafton 1985). Erasmus' spokesman Bulephorus articulates the same claim in the *Ciceronianus*: "ne statim existimes deterius, quod dissimile est" (Erasmus 1971, 705), whose wording is hardly dissimilar from Aper's in Tacitus. So Muret's Tacitism participates in a much larger tendency of the modern age, which we can call historical

relativism and which is filled with productive tensions for historical thought.

Muret's public lectures helped to trigger what Momigliano has called "the sudden vulgarization of Tacitus" in the 1580s (Momigliano 1947, 98). As a witness to this chronology, he cites the Italian prose writer Giovanni Botero, famous for his treatise on reason of state. At the outset of the 1580s, Botero apparently was not familiar with the name of Tacitus, but by the end of the decade he informs us in the preface to his *Ragion di stato* (1589) that, wherever he went on either side of the Alps, at the courts of kings and princes he found people who would spend all day talking about reason of state and quoting either Machiavelli or Tacitus. As Botero was prefacing his work, Justus Lipsius, having seen to press his fifth edition of Tacitus, was preparing for publication the *Politicorum libri sex*. In a letter from September 1589 addressed to Michel de Montaigne, Lipsius announces the imminent publication of his work: "et nescio quid in Politicis brevi dabo, meo textu, non tamen filo" (MacPhail 2014, 84). The text is his, but the thread is supplied by others. As it turns out, Lipsius would supply plenty of thread to Montaigne when he revised his essays on the *Exemplaire de Bordeaux* after receiving a copy of the *Politica* from the author. Lipsius's *Politica* is in fact a vast tapestry of quotations taken from classical authors writing about politics and government. Preeminent among them is Tacitus, as Lipsius explains in the *Auctorum syllabus* that precedes the work:

See here, if you like, in one glance the authors from whom this book has been derived. CORNELIUS TACITUS stands out among them, who must be especially mentioned, because on his own he contributed more than all the others together. The reason for this is the man's Prudence, and the fact that his text is very full of pithy formulations; but also that he is very familiar to us, and presented himself without being asked. (Lipsius 2004, 255)

Jan Waszink, from whom this translation is taken, calculates that of the total number of 2669 quotations used by Lipsius, 528 or 21% [sic] are supplied by Tacitus (Lipsius 2004, 149). Tacitus's sententious style certainly lends itself to such a labor of excerption, and his prudence is unrivaled.

In effect, what Lipsius did was to merge two of the most important trends of Renaissance culture, Tacitism and commonplace method, in order to create a Tacitean commonplace book that inspired many others in its wake. The commonplace method, as Waszink argues astutely (Lipsius 2004, 155), seriously inflects the understanding of Tacitus's meaning, for the author of the *Annals* seems less broodingly ambivalent, less disillusioned with despotism, when taken in bite-size doses.

In the same year of 1589, after the publication of the *Politica*, Lipsius's publisher issued a separate volume of notes entitled *Ad libros Politicorum breves notae*. The note to book one, chapter nine of the *Politica*, on history as the easy road to prudence (*facilem ad Prudentiam viam*), appends a list of prudent historians, both Greek and Latin. Among the Latins, Tacitus is the leader, not by virtue of eloquence but for his other qualities, especially prudence and judgment. He has an amazing capacity to express more than he seems to express, or to mean more than he says: "Mirabilis omnino scriptor, et qui serio hoc ipsum agit, quod non agit" (Lipsius 2004, 733). In other words, Tacitus is the master of the art of insinuation, and he trains his readers to discern implicit meanings. This is the same property that Erasmus claims for his *Apophthegmata* and Montaigne for his *Essays*, and that Quintilian summarizes in the rhetorical figure of *significatio*: "plus significat quam dicit" (MacPhail 2014, 139–140). In this way, Lipsius inscribes Tacitus at the head of a tradition that includes some of the great monuments of Renaissance literature.

The following decades ushered in the Italian vogue for Tacitism, *il tacitismo*, illustrated, so to speak, by a host of second rate authors dutifully catalogued by Benedetto Croce in his history of the Italian baroque (Croce 1957, 86–89). Most of these works "serve the purposes of a disguised Machiavellianism" (Momigliano 1947, 98), but there is one which stands out both for its formal and ideological qualities. Traiano Boccalini not only authored a vernacular commentary on Tacitus that remained in manuscript until 1677 but also composed the satirical masterpiece *Ragguagli di Parnaso*, published in two centuries or collections

of 100 chapters, the first in 1612 and the second in 1613, the year of his death. With Boccalini's *Ragguagli*, we can see how the vogue for Tacitus was ripe for satire. In chapter 23 of the first volume, Lipsius, who had died in 1606, makes his triumphal entry into Parnassus, which occasions a quarrel over precedence between Tacitus, representative of political studies, and Seneca, champion of moral philosophy. Seneca is forced to yield, because the philosophers know that politicians will use any unscrupulous means to obtain their end. Having completed his triumphal procession with Tacitus at his right hand, Lipsius displays stunning ingratitude when he accuses Tacitus of impiety for having denied divine providence. Tried in the court of Apollo, the case turns on the interpretation of a passage from book one of the *Histories* (1.3) where the narrator suggests that the gods are not concerned with our safety, which Lipsius misinterprets in Christian terms. Tacitus is the only one who can correctly expound his own text and show that his sentiment was not only not impious but in fact an exemplary statement of piety, since the gods punished Rome for its crimes. Lipsius is obliged to admit his fault and to confess to his master, "the more we read you, the less we understand" (Boccalini 1624, 85), which is a dubious tribute but a fitting expression of Tacitism. This pseudo trial is an interesting parody of various aspects of Tacitism, since it stems from a philological problem, the meaning of *securitas nostra* (Tacitus 1911, 3) in Tacitean usage, and it pits a censorious Christian view of Tacitus against a historically relative interpretation where Tacitus furthermore comes out very strongly against despotism and tyranny. In this respect, Boccalini's episode represents the potential for a politically dissident, if not republican Tacitism.

Having once accused Tacitus, in a later episode of Boccalini's work (I, 86), Lipsius goes to the other extreme and professes such unqualified admiration for the Roman historian that, out of envy, other disciples of Tacitus like Beatus Rhenanus, Josias Mercier, and Muret accuse Lipsius of idolatry. When brought in chains to plead before Apollo, Lipsius rehearses the usual praises of Tacitus as the father of human prudence,

the very oracle of reason of state, and the touchstone for assaying the value of princes. Indignant, Apollo responds with a comprehensive vituperation of Tacitus, reversing all the value judgments expressed by Lipsius and leaving the audience, both inside and outside the work, uncertain of Tacitus's true merit. For Apollo, the very worst and most "intolerable" part of Tacitus is the life of Tiberius (*Annals* 1–6), which long remained hidden in Germany until some cursed German brought the manuscript to life at the very same time as Luther was spreading his heresy (Boccalini 1624, 404). This dual condemnation of Luther and Tacitus, as the dual source of a modern scourge emanating from Germany, prompted Momigliano's broad claim that "Tacitus found himself at the confluence of the two great movements of the sixteenth century, religious reform and monarchic absolutism" (Momigliano 1990, 122). Boccalini's Apollo rounds off his oration with a parodic lament that nowadays Tacitism is such a plague that even the shopkeepers and porters are experts in reason of state. When Lipsius steadfastly refuses to recant his beliefs, Apollo sentences him to be burned at the stake, like a heretic. In effect, in this warped parody of the Counter-Reformation, Lipsius risks becoming a martyr of Tacitism, although upon the point of death, he earns a reprieve in recognition of his Stoic constancy. While Boccalini's own view of Tacitus remains ambivalent, it seems clear that he enrolls the historian in a polemic against the cruelty and intransigence of religious orthodoxy, a polemic that was destined to enjoy a great future in seventeenth-century Europe. This may indeed be the most important aspect of Tacitism for the history of modern thought.

Boccalini was not the first to suggest a connection between the legacy of Tacitus and the urgent question of religious tolerance. Already in 1580, when he published the first edition of his *Essays*, Michel de Montaigne devoted an essay to the Roman Emperor Julian the Apostate under the provocative heading "On the freedom of conscience" (II, 19). The essay begins not with the posthumous reputation of Julian, whom Montaigne would rehabilitate, but with the fate of the

work of Tacitus. Good intentions, Montaigne tells us with his usual taste for paradox, can produce very vicious effects if they are pursued without moderation. The prime example of a viciously good intention is religious zeal, which has wrought havoc not only in his own era of religious war but also in late antiquity when Christians destroyed pagan literature in the name of religion. Of this process, Cornelius Tacitus is a good witness, "un bon tesmoing" (Montaigne 1978, 668), since most of his works were destroyed by Christian censors. The same zeal can also lead to the unwarranted defamation of pagan emperors such as Julian. In this prologue, Tacitus, who chronicled Nero's persecution of Christians, becomes an unexpected witness in the sense of a martyr to freedom of conscience. He witnesses the vicious effects of religious intolerance and persecution. Moreover, when Montaigne visited Rome in November 1580, his books were confiscated, including his copy of the *Essays*, and only returned to him the following March, with an explanation that the Roman censors had reviewed his work and formulated a certain number of objections (Montaigne 1992, 119). One of their objections was to the essay on freedom of conscience. So Tacitus's relation to religious tolerance is by no means an antiquarian question in an era of censorship, confessional struggle, and uneasy religious pluralism. From Montaigne to Boccalini, Tacitism becomes intertwined with the paradigmatically modern cause of freedom of conscience.

If we look back in retrospect in order to assess the legacy of Tacitus in early-modern Europe, we are struck by the hesitations, contradictions, and equivocations of his readers. It is not easy to measure the true scope of his influence. It is possible to dismiss Tacitism as a superficial fashion or, as Peter Burke suggests among possible conclusions to his survey of Tacitism, "as no more than a transition between moralized politics and scientific politics" (Burke 1969, 168). In this view, Tacitism is simply a step on the way from Christianity to social science. At the other end of the scale of possibilities, Arnaldo Momigliano, writing in the aftermath of fascism, thought that Tacitus had identified a problem "of immediate

relevance to us” (Momigliano 1990, 131). We may even suggest that, because of its contested relationship to religious orthodoxy, Tacitism, no less than Tacitus, remains immediately relevant today.

Abstract

Matteo Tafari, lover of Greek and Latin literature, *philosophus*, physician, and skilled astrologer, was born in 1492 in Soletto, a small town in the Otranto area, where he died in around 1584.

From the Aristotelian tradition, he adopted elements of *physica*, understood as knowledge of celestial and terrestrial phenomena in relation to their natural causes, whereas Plato's *Timaeus* was a particular inspiration for his *Commentary on the Orphic Hymns*, where, as in the *Pronostico*, Ptolemy also proved to be a decisive source of influence, reinterpreted in the light of Plotinus' concept of star signs.

While the *Pronostico* confirms Tafari's ability to read horoscopes, his *Commentary on the Orphic Hymns* is a fairly bold attempt to combine Orphic, Platonic, and Hermetic elements with Aristotelianism, as well as Counter-Reformation Thomism.

Biography

Matteo Tafari, lover of Greek and Latin literature, *philosophus*, physician, and skilled astrologer, was born in 1492 in Soletto, a small town in the Otranto area, where he died in around 1584. As a young boy, he imbibed the teachings of Sergio Stiso, at whose school he learned Greek and Latin literature. He later spent various periods in Naples, where he studied the art of astrology and rubbed shoulders with Neapolitan scholars of medicine, natural magic, and physiognomy. The Neapolitan experience proved decisive for him. His relationship with Giovan Vincenzo Della Porta, elder brother of the more renowned Giovanni Battista, was of particular significance (Badaloni 1960; Rizzo 2014).

Tafari's talent blossomed so rapidly that his teachers urged him not to stay in Naples but to immerse himself in the most advanced schools of European culture. Thus Tafari frequented not only the most renowned centers of Italian culture, such as Rome, Padua, and Venice, but also went to England, France, and Spain. In 1525 he was in Venice. This was the period of his astrological dispute with Luca Gaurico, who dedicated to him a short section of his *Tractatus astrologicus*, which also features his native chart. Tafari later went to England, where he was suspected of Lutheranism and indulged in some misguided prophecies, predicting the imminent death of Charles V. It appears that Tafari may have been drawn toward certain shamanistic magical-religious practices there. Thus, on his release from prison, he went to Ireland, where he was accused of practicing magic and condemned by the Inquisition. However, papal intervention led to the charges being dropped, and Tafari was able to return to Venice.

In the following years, the philosopher was in Paris, where it appears that he graduated in

Artibus from the Sorbonne. He then went to Spain, Greece, and probably also Asia Minor (Manni 1997; Di Mitri 2001; Papuli 2001; Rizzo 2001; Galante 2005; Rizzo 2014).

Heritage and Rupture with the Tradition

He is reputed to have written several works of natural magic, physics, physiognomy, and astrology. However, only two manuscripts still survive: a *Commentary on the Orphic Hymns* (pre-1537), written in Byzantine Greek, and *Pronostico del nascimento di Hemilio Del Tufo* (1571), in Italian vernacular. From the Aristotelian tradition, he adopted elements of *physica*, understood as knowledge of celestial and terrestrial phenomena in relation to their natural causes, whereas Plato's *Timaeus* was a particular inspiration for his *Commentary on the Orphic Hymns*, where, as in the *Pronostico*, Ptolemy also proved to be a decisive source of influence, reinterpreted in the light of Plotinus' concept of star signs.

Innovative and Original Aspects

While the *Pronostico* confirms Tafari's ability to read horoscopes, his *Commentary on the Orphic Hymns* is a fairly bold attempt to combine Orphic, Platonic, and Hermetic elements with Aristotelianism, as well as Counter-Reformation Thomism.

Thus, although he adopted aspects of Renaissance Platonism, permeated by Hermeticism and a certain mystagogical tendency, he also participated in the most advanced upheavals in the cultural environment of southern Italy, helping to reestablish natural magic on a new basis.

Impact and Legacy

His great ability to forecast future events, certainly frowned upon in the ecclesiastical circles of the late sixteenth century, earned him an extravagant mention in Giovan Battista Della Porta's *Coelestis physiognomonia*, in which the philosopher from Soletto is remembered as a man of excellence in every field of learning (Della Porta 1996).

Abstract

Omer Talon was a French humanist and author of books on rhetoric. He was a close friend and colleague of Petrus Ramus.

Alternate Names

[Talaeus, Audomarus](#)

Biography

The details of Omer Talon's life remain quite a mystery. We know that from 1534 onward, he taught rhetoric at the Collège du Cardinal Lemoine in Paris – a college of the former Université de Paris – and that he was a fervent disciple of Petrus Ramus.

Works

Omer Talon became famous for his commentaries on the works of Cicero (*Cicero, Marcus Tullius. Academia. In academicum Ciceronis fragmentum explicatio*, [1547a](#)) and Porphyry (*Dialecticae praelectiones in Porphyrium*, [1547b](#)), as well as his ideas on the components and content of rhetoric. He wrote *Institutiones oratoriae*, which was published in [1544](#) and reprinted several times (Pettergree and Walsby [2012](#), pp. 1506–1507). This work, which serves as a counterpart to Petrus Ramus's *Dialecticae institutiones* (1543), presents a basic discourse on the ornament of style, focusing on the number (*numerus*) and rhythm of Talon's time (Meerhoff [1986](#), p. 191 *sqq.*). His approach was clearly influenced by Ramus, precursor to

Descartes (La Ramée 1555). In fact, the two men worked so closely together that the authorship of their respective texts is sometimes put into question. *Dialecticae institutiones* and *Institutiones oratoriae* predicted that rhetoric would be split into dialectic – which, at the time, was related to *dispositio* (or “judgment”) and *inventio* – and rhetoric, the art of speaking well and elegantly through figures of *elocutio*. The combined works of Talon and Ramus therefore marked a turning point, with the onset of “restricted rhetoric” (Genette 1972, pp. 21–40), which progressively became confined to *elocutio* and detached from logical considerations.

Rhetorica ad Carolum Lotharingum was published in 1548. Three hundred and ten editions of this popular text were published in a dozen or so countries, up until the following century (Pettergree and Walsby 2012, pp. 1506–1507). This work defines rhetoric as the art of speaking well, notably by mastering style and pronunciation. Style is determined by tropes (metonymy, irony, metaphor, and synecdoche) and figures – such as number (*numerus*) – that are important when looking at the rhythm. Pronunciation focuses on tone and gesture. Once again, the link with Ramus’s ideas is apparent: Talon’s ideas on rhetoric had already appeared in Ramus’s *Brutinae quaestiones* and *Rhetoricae distinctiones in Quintilianum*, published in 1547 and 1549, respectively. In 1555, Antoine Fouquelin translated Talon’s *Rhetorica* into French (*Rhétorique française*), making a few changes to the examples (Fouquelin 1990; Meerhoff 2001, p. 96; Leake 1968).

Tartaglia, Niccolò

Born: Brescia, Italy, 1499 or 1500

Died: Venice, Italy, December 13, 1557

Andrea Bernardoni
Institute and Museum of the History of Science,
Museo Galileo, Florence, Italy

Abstract

Considered one of the greatest Italian algebraists from 500, he is principally known for his

contribution to the solution of cubic equations and the dispute with Lodovico Ferrari and Girolamo Cardano. Known are his studies of ballistics and his works as editor and translator of Euclid and Archimedes.

Synonyms

Fontana, Nicolò; Tartalea; Tartaia

Biography

Nicolò Fontana, the real name of Tartaglia, was born into a poor family; his father died when he was 6 years old and his childhood was beset with difficulties. In his *Quesiti et inventioni diverse*, he tells a story about having to interrupt his education when he got to the letter “K” in the alphabet. From then on he was self-taught and studied “the works of dead men” (*Quesiti*, bk. VI, question 8). During the pillage of Brescia in 1512, he was seriously injured by Gaston de Foix’s soldiers: a sword blow to the face caused permanent damage to his jaw and as a result, he stammered for the rest of his life. It was for this reason that he was called “Tartaglia” – which means stammer in Italian. In his career as a mathematician, he taught Abacus in Verona and Mathematics in Venice where he died in 1557.

Heritage and Rupture with the Tradition, Innovative and Original Aspects, Impact, and Legacy

Tartaglia’s name is linked to the history of Algebra, Topography, and Military Science.

His most important contribution to Mathematics concerns the solutions of cubic equations. The formula was first discovered by Scipione del Ferro (1465–1526) during the first 20 years of the sixteenth century, but was never disclosed.

Tartaglia rediscovered the same method in 1535, but he communicated the formula in his *Quesiti* in 1546 after it had been published without the author’s approval by Girolamo Cardano in his *Ars Magna*. This led to a dispute between Tartaglia and the mathematician Lodovico Ferrari

(1522–1565), a disciple of Cardano. Between February 1547 and August 1548, Ferrari published six Pamphlets (*cartelli*) which provoked six replies from Tartaglia (Ferrari and Tartaglia 1876).

The mathematical areas developed in the replies to the Pamphlets are multiple and refer to topics such as Calculus, Extraction of Root Numbers, Calculation of Denominators, Combinatorial Analysis, and the Calculation of the Coefficients of the Binomial which culminates in the definition of the so-called Tartaglia triangle.

Tartaglia developed an important role in the spread of classical geometrical and mathematical theories, publishing the first Italian translation of the *Elementi di Euclide* (Euclide 1543) and a collection of writings by Archimedes edited by William of Moerbeke in the thirteenth century (Archimedes 1543). In 1551 he returned to the works of the Syracuse scientist and wrote for the Venetian editor Curtio Troiano Navò the commented Italian translation of part of the first book of *De insidentibus aquae*, in addition to *Opusculum de ponderositate* by Giordano of Nemore.

Tartaglia also made important contributions in the field of Mathematics to the Military Arts. In 1537, he published *La nuova scienza*, a treatise traditionally considered to be the first work dealing with the science of external ballistics based on Mathematics.

The author presents the new science as a discipline for the use of artillery; however, references to technology and the phenomena connected to the use of firearms are marginal compared to those on the movement of bullets which is the main topic of the book. Tartaglia concludes that, leaving aside air resistance – a negligible element for heavy bodies like artillery bullets in his opinion – the trajectory described by them is always curved, and the maximum range can be reached with an elevation of 45°. In the treatise, some measuring instruments are described including the gunner’s quadrant which facilitated the positioning and elevation of the cannon and the ballistic tables. These themes were also dealt in *Quesiti* and in *General trattato di numeri et misure* (1556–1560). In the brief treatise *Travagliata invenzione*, Tartaglia finally presents a method for the salvaging of shipwrecks in addition to various topics of Technology, Meteorology, and Physics.

Abstract

Pierre Tartaret (d. 1522) was a philosopher and theologian active at the University of Paris during the late fifteenth and early sixteenth centuries. His *oeuvre* primarily consists of commentaries on school authors (Aristotle, Peter Lombard, and Peter of Spain), whom he explained according to the doctrines of Duns Scotus or fourteenth-century nominalists such as John Buridan and Albert of Saxony. His commentaries on logic and natural philosophy, in particular, had a remarkable *fortuna* and were reprinted until well into the seventeenth century.

Biography

Pierre Tartaret was a Scotist philosopher and theologian active at the University of Paris around the turn of the sixteenth century. Nothing is known

about the earliest years of his life, except that he was born in Romont, in the diocese of Lausanne. He enrolled at the University of Paris, probably c. 1480, where he studied philosophy at the Collège de Reims under Johannes Sudoris. He took his Bachelor's degree in 1483 and his Master's 1 year later, in 1484 (Lohr 1972: 372). Since the title of Master of Arts was only granted to students who had reached the age of 20, Tartaret was probably born in the first half of the 1460s. After graduating, he started teaching philosophy at his college; Jérôme d'Hangest and possibly also Josse Clichthove figured there among his students (Demonet 1999: 91; Sullivan 2011: 516–517). He combined these teaching duties with higher studies: in 1496, he obtained his licentiate in theology, and in 1501, he became a Doctor of Divinity (Müller 2013: 17–20). As a member of the (secular) Third Franciscan Order, he is known to have lectured on Peter Lombard's *Sentences* at the Franciscan convent at Paris during the early sixteenth century (Villoslada 1938: 218–219; Wegerich 1942: 187–190). Tartaret was one of the most respected members of the theological faculty at that time, which can be judged by the fact that he formed part of the committee of Parisian theologians who were assigned the task of examining the writings of the German humanist Johann Reuchlin in 1514 (Giard 1980: 12). He died in 1522, probably around the age of 60.

Philosophy

Apart from a treatise on natural philosophy based primarily on Gregory of Rimini (Tartaret 1493c), Tartaret's philosophical work consists solely of commentaries, which are the product of his teaching at the Arts Faculty and the Franciscan convent: he commented on Peter of Spain's *Summulae logicales* (Tartaret 1494a), Peter Lombard's *Sentences* (Tartaret 1494b, 1519, 1520), and nearly the entire Aristotelian corpus (Tartaret 1493a, b, 1496, 1504). Most of these commentaries, which remain largely unstudied to date, were prepared for publication during the 1490s. According to his own testimony, they bear the stamp of the philosophy of Duns Scotus (*secundum mentem Scoti*). This Scotist inclination

is particularly apparent in his interpretation of theological and metaphysical issues, above all in his commentary on the *Sentences*: Tartaret's understanding of objective reality (i.e., entities that have only mental existence such as mathematical rules) in the first book of this commentary is indebted to the Scotist philosophers Johannes Canonicus and Antonio Trombetta (Marrone 2008: 295–297), and large parts of this commentary are essentially abridgments of Scotus' *Ordinatio* or *Opus Oxoniense*, which was itself a commentary on the *Sentences* (Zahnd 2014: 480–483). In addition, Prantl (1870: 204–207) pointed out that the introductory chapters of his commentary on the *Organon* contain a polemic against the nominalist conception of universals, and he stressed that Tartaret adhered to a strict Scotist interpretation of this issue. In the field of logic and natural philosophy, however, he was heavily indebted to fourteenth-century nominalists such as John Buridan, Albert of Saxony, Marsilius of Inghen, and Pierre d'Ailly. When, in his commentary on the *Summulae*, Tartaret addressed the relation between written and spoken propositions, for example, he refuted Buridan's opinion that the immediate significate of a written proposition is its spoken equivalent, arguing instead in favor of Pierre d'Ailly's view that both types of proposition stand on the same level and, hence, cannot be described in terms of sign and significate: both refer, through mediation of a concept, to things outside the mind, but cannot be subordinated to one another (Demonet 1999: 95–96; Meier-Oeser 1997; Nuchelmans 1980: 16–20; on Tartaret's logic, see also Ashworth 1974; Bäck 1996: 208–209; Ferreira 1952; Krieger 1990). His account of impetus theory, as outlined in his commentary on Aristotle's *Physics*, is copied verbatim from Marsilius of Inghen's *Abbreviationes libri Physicorum*, and for the question of acceleration and natural movement, he relied heavily on Albert of Saxony's *Quaestiones in libros De caelo et mundo* (Duhem 1959: 97–105).

Impact and Legacy

Tartaret's commentaries, which were regularly reprinted between the 1490s and 1520s, were

quite popular during the first decades of the sixteenth century. His works on natural philosophy were taught at the University of Heidelberg when Philipp Melanchthon studied there during the 1510s (Pozzo 1998: 274), and his commentary on the *Summulae logicales* was used as a textbook at the University of Louvain in the same period. The Strasbourg educationalist Johann Sturm called him one of the leading logicians of his day (Sullivan 2011: 517; see also Ashworth 1974: 2), and Petrus Ramus may have read his manuals on logic when he studied for his Arts degree in Paris, at the Collège de Navarre (Ong 1958: 141). Yet his fame seems to have declined rapidly after 1520, when humanism gradually got a stronger grip on university teaching. Erasmus called him a sophist in his *Ratio verae theologiae* of 1518, and together with William of Ockham, John Mair, and Thomas Bricot, he was ridiculed by Rabelais, who satirized him by claiming that he wrote a treatise *De modo cacandi*, “On How to Defecate” (Bowen 2011: 39). Near the end of the sixteenth century, however, his works experienced a final revival. They were reissued under the impulse of Franciscan friars (mainly Italians), which resulted in a second flow of editions between the 1570s and 1620s, with an edition of his *Opera omnia* published in Venice as late as 1621 (Demonet 1999: 87). This sudden rise in popularity was due to his increasing use as a school author in the Franciscan *studia*, a practice that was formalized in 1594 and repeated in 1619, when Giacomo Montanari, the Minister General of the Order, declared in his *Ratio studiorum* that Peter of Spain and Aristotle’s logic should be explained “according to Tartaret” (*secundum viam Tartareti*) (Andersen 2016: 8–9). His works, though still known to Bartolomeo Mastri, a Franciscan philosopher active c. 1650, fell into oblivion in the second half of the seventeenth century (Forlivesi 2002: 119–120).

Institute for Mediterranean Studies/FORTH

(Foundation for Research and Technology – Hellas), Rethymno, Greece

Abstract

Tāshkubrī'zādah, Taşköprüzade, or Taşköprülüzade, İsamüddin Ahmed, son of Mustafa (2 December 1495 [Bursa] to 13 April 1561 [Istanbul]) was an Ottoman scholar and teacher and author of an encyclopedia of the sciences and of a collection of biographies of Ottoman sheikhs and jurists.

Alternate Names

[Taşköprülüzade](#); [Taşköprüzade](#)

Biography

Ahmed Taşköprüzade was the son of Muslihüddin Mustafa Taşköprüzade (1453–1529), judge, teacher, and the preceptor of Prince Selim (afterwards Selim I). After receiving the first

education from his father, he studied in various *medreses* (religious colleges) in Ankara, Bursa, and Istanbul and then became a teacher himself. He taught in Skopje, Istanbul, and Edirne and in 1551 became a judge of Istanbul, one of the highest posts in the ulema (jurist) hierarchy. He retired due to bad eyesight in 1554 and spent his last years dictating his works. Among his books, the most celebrated are *aş-Sakâ'ik an-nu'mâniyya* ("The Crimson Peony," completed in 1558), a biography of 502 Ottoman sheikhs and ulema, and *Miftâh as-sa'âde* ("Key to Happiness," completed in 1557), an encyclopedia of sciences, both in Arabic (the latter was translated by his son into Ottoman Turkish, with some additions).

Heritage and Rupture with the Tradition

In some respects, Tašköprüzade epitomizes the Islamic tradition of rational thought; his career shows an erudite scholar who had conscience of the place of his state in Islamic history and tried to justify it from a cultural point of view. From the aspect of philosophy, his most important work (yet the least studied so far) is the *Miftâh*, his encyclopedia, where he tried to provide a systematical account of the knowledge of his era. Nearly 400 branches of science, from mathematics to grammar and from Koranic sciences to magic, were described in this ambitious work. Tašköprüzade further attempted to classify these branches along the stages of God's manifestation according to the Sufi doctrine (universal spirit, intellect, nature, and man), which correspond to different stages of knowledge. Thus he recognized:

- (a) The spiritual sciences. These are further divided into practical and theoretical and again subdivided into those based on reason and those based on religion. This classification produces eventually four classes: (1) philosophical (or theoretical-rational) sciences (*ulûm-ı hikemiyya*), which include metaphysics (the science of man's soul), theology (angelology, prophetology, etc.), natural

sciences and medicine (including magic, alchemy, or the interpretation of dreams), mathematics, and music; (2) practical philosophy (*hikmet-i ameliyya*) or the practical-rational sciences, i.e., ethics and administration (from household to politics and the army); (3) religious or theoretical-religious sciences (*ulûm-ı şer'iyya*), i.e., Koranic exegesis and jurisprudence; and (4) finally, esoteric or practical-religious sciences (*ulûm-ı bâtinîyya*), i.e., mysticism.

- (b) The intellectual sciences (*makûlât-ı sâniyya*), such as logic, dialectics, or the art of debate.
- (c) The oral sciences (*ulûm-ı lafzîyya*), i.e., those pertaining to language. These include lexicography and etymology, grammar, and rhetoric, but also literary sciences such as philology and, interestingly, history or "conversation with rulers."
- (d) The written sciences (*ulûm-ı hattîyya*), i.e., calligraphy, spelling and orthography, the art of inscriptions, etc.

Furthermore, all sciences are to be differentiated according to their usefulness (politics, for instance, is considered a useful science), but also as good (those which are auxiliary to religion) and bad (such as astrology or magic); this distinction, however, mainly depends not on knowledge itself but on the use one makes thereof.

As for his religious views, Tašköprüzade follows al-Ghazali (1058–1111) in that, in order for a scholar to attain the greater realities, the mystical sciences are deemed necessary and these are based on esoteric contemplation. Moreover, in the old Islamic debate between extreme mysticists and rationalist "philosophers," he adopted al-Ghazali's moderate stance, insisting that mysticism should be interpreted in its own terms and that practices such as the Sufis' use of music or dance are acceptable. However, no one should devote oneself to only one branch of knowledge, since they all complement each other; in this respect, Tašköprüzade argued that the theoretical sciences, such as theology or mathematics, should regain their place (which had started to wane) in the *medrese* curriculum.

Innovative and Original Aspects

Taşköprüzade's encyclopedia may be said to summarize the Islamic knowledge of his era. Furthermore, his taxonomy of science seems to be quite original: its influences from al-Ghazali and (possibly) Ibn Khaldun notwithstanding, it does not follow any of the previous categorizations (cf. Gardet–Anawati 1970, 101–124).

Impact and Legacy

Taşköprüzade's work had a strong influence on Ottoman letters. His encyclopedia was translated to Ottoman Turkish by his son, Kemalüddin Mehmed Efendi, under the title *Mevzu'ât al-'Ulûm* ("Subjects of the Sciences") and had great success; Kâtip Çelebi (q.v.)'s bibliographic encyclopedia (the *Keşf al-Zünûn*) was compiled along Taşköprüzade's lines. His biographical work was considered a classic, and many subsequent authors wrote additions and supplements well into the seventeenth century.

Taurellus, Nikolaus

Born: 26 November 1547, Mömpelgard (Montbéliard)

Died: 28 September 1606, Altdorf

Günter Frank
Europäische Melanchthon-Akademie Bretten,
Bretten, Germany

Abstract

Taurellus was a philosopher and medical scientist at Tübingen, Basel, and Altdorf. The main thesis of his first philosophical writing “*Philosophiae Triumphus*” was met with vehement opposition among Lutheran theologians because he claimed that philosophy was the foundation of theology. In his later metaphysical writing, he took up the concept of metaphysics in which the general doctrine of God was removed from the metaphysics and later passed on to the modern concept of the philosophy of religion. His definition of God as “*substantia absolutissima*” made him a forerunner of modern metaphysics.

Alternate Names

[Oechslein, Nikolaus](#)

Biography and Oeuvre

Taurellus studied philosophy in Tübingen in 1560 under Jacob Schegk (Degen) (1511–1587) and Samuel Heiland (1533–1592); 1565 Master of Philosophy and beginning of theology studies. From 1566, he studied medicine in Basel under Theodor Zwinger (1533–1588); 1570 Doctor of

Medicine. 1573, saw the publication of his important early work *Philosophiae Triumphus*, the first draft of a Protestant metaphysics in three parts: theological anthropology, the theory of principles in metaphysics, and the speculative doctrine of God. His main thesis that philosophy is the foundation of faith itself was met with vehement opposition. Taurellus’ justification for the thesis that philosophy was the foundation of theology postulated that philosophy must be antecedent as: “in Christ he believeth not who knoweth not God” (Ed. Wels (2012), p. 232). In this respect, i.e., that knowledge of the existence and power of God precedes faith, he argues that philosophy forms the foundation of theology as a doctrine of revelation. From 1580, Taurellus taught as a professor of medicine and natural philosophy at the University of Altdorf where his late works were published. The *Synopsis Aristotelis Metaphysices* of 1596 takes up the concept of metaphysics found in Late Scholasticism in Spain (Benedictus Pererius, ca. 1535–1610; Francisco Suárez, 1548–1617) in which the general doctrine of God was removed from the metaphysical and later passed on to the modern era as natural theology, ultimately leading to the newer philosophy of religion. Borrowing from Book 12 of Aristotle’s *Metaphysics*, which first deals extensively with sensible and changeable substances and then gradually traces them back to an eternal immovable substance, Taurellus reinterpreted the notion of God: since God is the most perfect being, his being exists in a state of pure reality so that God, in contrast to all other entities, is the most absolute substance (*substantia absolutissima*), a definition that presages modern metaphysics. Taurellus’ outline had a significant influence on the direction of natural theology in the Lutheran and Reformed traditions. His *Alpes caesae* of 1597 serves as a critique of the pantheism and world-soul teachings of Italian physician and philosopher Andrea Cesalpino (1519–1603). Taurellus criticized his theory of *anima universalis* on the grounds that it manifested a latent pantheism, as well as Cesalpino’s acceptance of the unity of the intellect, which seemed to refute the concept of the individuality of the human soul. Both important cosmological texts published in 1603 presented

discussions of contemporary debates on, for instance, the pseudo-Aristotelian, Apuleian text *De mundo* as explicated by Francesco Piccolomini; they are both, however, now thought to be lost. In his *Kosmologia*, Taurellus developed the theory that God created the world and all nature in such a way that no further intervention was required. Creation would not be perfect if what had been created could not subsist of itself. This thesis, which rejected the concept of the divine conservation of the world (*de mundi conservazione*), is fully in line with theodicy as it asserts that God's goodness cannot be reconciled with an imperfect world. In his *Uranologia*, he turns to general questions on the celestial bodies, exploring their materiality and corruptibility, which he attributes to the prime mover: if the prime mover is eternally both *substantia* and *actus*, it must be capable of moving the celestial spheres. In his *De rerum aeternitate* from 1604, Taurellus renewed his endeavors towards a harmony of philosophy and theology, which even found acceptance in the Enlightenment (Pierre Bayle, 1647–1706; Gottfried Wilhelm Leibniz, 1646–1716). This work discusses fundamental questions of cosmology, psychology, and metaphysics, contesting Francesco Piccolomini and Andrea Cesalpino. He establishes the relationship between theology and philosophy by the theory of three states: *philosophica ratio*, the first state of humanity, consists of the perfect knowledge and action of mankind, while the second state, after the Fall of Man, led to the loss of eternal paradise, ending in despair and eternal misery but not the abolition of the human cognitive faculty; the third state ultimately refers to theology, the object of which is divine grace.

Teive, Diogo de

Born: c. 1513–1514, Braga

Died: c.1565, somewhere in Portugal

Catarina Fouto

Department of Spanish, Portuguese and Latin American Studies, King's College London, London, UK

Abstract

Diogo de Teive (c. 1513–1514?– c.1565?) was a Portuguese humanist. He studied in Spain and France, and upon returning to Portugal, he taught at the Colégio das Artes in Coimbra, where he was denounced to the Portuguese Inquisition alongside George Buchanan. He was an accomplished Neo-Latin prose writer, playwright, and poet (for a modern edition and translation, see Teive 2012).

Alternate Names

[Tevius, Didacus](#); [Tevius, Iacobus](#)

Biography

Born in the northern Portuguese city of Braga, Teive left his homeland at the age of 12 to study abroad at the Collège de Saint-Barbe, where Portuguese scholars were educated thanks to the grants awarded by King João III. Obeying his father's wishes to give up theology and study civil law, Teive left for Salamanca (1532–1534), where he became disappointed by the poor quality of the teaching of Greek. He returned to Toulouse

to continue the study of law but met with financial difficulties and then accepted André de Gouveia's invitation (in 1536) to teach in Bordeaux, at the Collège de la Guyenne, where Gouveia acted as principal. Teive taught both grammar and rhetoric at the highest level, while continuing his studies of Greek and law. In 1538 he went to Paris, where he made contact with the "lecteurs royaux" of the Collège Royal. After a short trip to Gascony, where Teive prepared the sons of two noblemen for entry to the university, he returned to Paris, but soon left for Montauban (in the summer of 1541), again to teach in the university. This teaching post allowed him to pay for his future studies of law at the University of Poitiers (1542). A year later, André de Gouveia invited Teive to return to Bordeaux, to the Collège de la Guyenne, where he met George Buchanan who became his friend.

In 1544, Teive was invited by King João III to teach at the Colégio das Artes in Coimbra, prior to which he was expected to help André de Gouveia to organize the team of staff to go from France to Portugal. Teive returned to Portugal in 1547, and with him came a prestigious group of international scholars: Buchanan, Elie Vinet, Nicholas de Grouchy, Guillaume de Guérente, and Arnould Fabrice. Well-known Portuguese academics included André de Gouveia, João da Costa, and Teive himself, who was responsible for the teaching of both Latin and Greek. In 1548, when Teive was replacing Gouveia as principal of the Colégio after Gouveia's death, an investigation into the activities in France of Teive, Costa, and Buchanan was ordered by the Inquisition in 1549: they were all accused of Protestantism and Teive, in particular, of possessing a copy of Calvin's *Institutio Christiani Religionis*, and of being a Lutheran. Teive, Costa, and Buchanan were convicted, deprived of their posts, and imprisoned, but Teive was treated with leniency and was released after a short period.

He moved to Braga to start an ecclesiastical career, and, upon returning to Coimbra, was appointed as principal of the Colégio das Artes (from 1552 to 1555) by King João III. When the Colégio was handed over to the Jesuits, Teive went to Lisbon to seek the help of the royal family: he was appointed as chaplain to the King and was

given the benefice of the royal priory of Vila Chã da Braciosa in Miranda do Douro (North of Portugal). Teive's return to Lisbon and to the court in particular occurred in 1563 and was the result of the patronage of the Spanish Julián de Alba, Bishop of Miranda, who was close to Queen Catherine of Portugal. Very little is known of Teive's final years: he died somewhere between 1565 and 1579, having likely left Lisbon for Braga after 1565.

Unlike many of his contemporaries whose work circulated in manuscript form, Teive had a successful career and his works were published in important centers in the Iberian Peninsula. He is the author of one significant historiographical account, his only published prose work: the *Commentarius de rebus a Lusitanis in India apud Dium gestis* (Coimbra, 1548) focuses on the siege of Diu, a Portuguese citadel in the south of Cambay, which suffered months of heavy fighting in 1546 against the army of Khoja Safar, at the service of Mahmud Shad, Lord of Gujarat. In addition to several minor occasional speeches and poems (see 1553, 1563, 1564a, 1564b), Teive also composed two substantial collections of poetry dedicated to the great men and women of his time in Portugal: the *Opuscula aliquot* (Salamanca, 1558) and the *Epodon libri tres* (Lisbon, 1565, see Fouto 2012). Teive also wrote two works of didactic poetry, the *Institutio Sebastiani Primi* (printed in the *Opuscula Aliquot* and in the *Epodon libri tres*; see Fouto 2011) and the *Sententiae* (in *Epodon libri tres*, 1565). He composed an important collection of hymns inspired by Prudentius' *Peristephanon* (book 2 of *Epodon libri tres*). Teive's biblical plays *David* and *Iudith* (now lost) were celebrated in his day, and his *Ioannes Princeps* (composed in 1554 but published in the *Opuscula Aliquot* in 1558, with a modern edition from 1977) is a rare example of classical tragedy commemorating a contemporary historical subject-matter (the death to the heir to the Portuguese throne).

Teleology in Renaissance Science

Matteo Fornasier

ERC Early Modern Cosmology 725883,
Ca’ Foscari University of Venice, Venice, Italy

Abstract

Teleology is the idea according to which every event is directed toward a precise aim, even those not depending on conscious actions. The teleological interpretation of the world is particularly important in Renaissance natural philosophy because of the detachment from tradition. Nature’s regularity and organization are no more attributed to God but to nature itself. Starting from the sixteenth century’s Italian philosophy, nature is believed to be sensitive and intelligent to different degrees, and it implies a completely new teleological interpretation of the world.

Introduction

The etymology comes from the Greek word τέλος (*telos*) which means “purpose, aim.”

It is the idea according to which every event is directed toward a precise aim, even natural

events, not depending on will or human conscious actions.

Heritage and Rupture with the Tradition

Aristotelianism and Neoplatonism interpreted the world in a strongly teleological way. Contrary to what has been taught by Atomism, the other main philosophical schools explained the cosmos's organization and the phenomena in it with a precise project, a universal blueprint designed and organized by a superior Intellect. Medieval philosophy, guided by the cosmological ideas of the three great monotheisms – Christianity, Islam, and Hebraism – followed ancient thought in the teleological interpretation of the world. The natural philosophy of Thomas Aquinas (1226–1274), father of scholastic philosophy, attributed the intellect only to human beings and to no other thing in the material world. All other elements do not have any kind of intelligence, but the actions they perform are guided by the supreme Intellect, organizer of the cosmos, which means God.

In Thomistic natural philosophy, no natural being is gifted with intelligence, but nevertheless, the actions they perform are not casual; they are intelligently directed by God toward a specific purpose. No intelligence or knowledge guide the rock in its race toward the center of the earth or the flame in its attempt to reach the skies, but they are both externally guided by the intelligence of God as well (Landucci 2005).

Innovative and Original Aspects

The idea of a universe teleologically organized is particularly important in Renaissance philosophy because of a radical change of perspective with respect to Medieval thought: from an external teleology to an internal one. Every natural event is still considered as directed toward a precise goal, and intelligence is still considered the *conditio sine qua non* for being able to have a precise goal; for Renaissance philosophy of nature, intelligence must be attributed to natural things as such.

In Bernardino Telesio's (1509–1588) philosophy, every movement and every physical process in the universe originate from the ancestral conflict between heat and cold, two incorporeal principles in perpetual opposition. The sun and earth are the cosmic locations of those two principles: the balance between the earth, always motionless because of the nature of cold, and the sun, always in movement because of the nature of heat, made life possible. According to Telesio, everything originates from this primordial form of life and sense that puts cold and heat one against the other, so the whole universe is sensitive in different degrees (Bondi 1997).

Telesio's most famous scholar, Tommaso Campanella (1568–1639), starting from the teachings of his master, said that thinking that God itself guides every natural thing toward its aim should be considered an insult to God's dignity. Rooted in the heat-cold conflict, the most fundamental elements have a certain form of elemental knowledge: they are able to understand what is harmful to them and what is useful to their survival. The rock is able to understand that flying in the air is harmful to its nature and that staying as low as possible is good for itself: the rock falls because it attempts to reach the lowest possible place; its knowledge doesn't go further because God decided that for a simple thing like a rock is appropriate a simple form of knowledge. Just because complex beings are made of simpler beings, superior forms of knowledge are based on lower forms. Human rationality, consciousness, and intelligence are not different by nature but by degree from those of the elements, minerals, plants, or animals. According to Campanella, the greatness of God's creation lies in its independence: a creation that during his whole existence needs the intervention of its creator to reach his aims (that was how Aquinas interpreted nature) is an imperfect creation, unworthy of God's perfection (Ernst 2010).

A teleological interpretation of the universe is a characteristic of many schools of thought in history, and it opens the way to important questions. If the world is wisely organized and it's "programmed" to reach a specific purpose, how is it possible? Thanks to which power? After centuries

dominated by the idea of a superior Intellect declined in many different ways that guide an almost inert nature toward its purpose, Renaissance philosophy marks a turning point in the history of thought and in particular in the teleological interpretation of the world: nature is intelligent and perfect enough to understand what is the best thing to look for and to get organized to reach it (Ingegno 1988). This was a completely new kind of teleological understanding and a new idea of nature's dignity.

Telescope in Renaissance Science

Matteo Cosci
Università Ca' Foscari Venezia, Venice, Italy

Abstract

The importance of the invention of telescope cannot be underestimated, neither regarding its instrumental value within the astronomic field during the "Scientific Revolution" (and uninterruptedly after) nor regarding its philosophical and symbolical significance in so far as it was a device – the first with such an impact on human knowledge – that was given credit

for, and recognized as, being able of increasing natural perceptual capacity (i.e., sight), well beyond its contingent limits, even enhancing it to a level of improvement that was thought as impossible to reach.

Impact and Legacy

The debut of what we know as "telescope," an optical instrument for enlarging the view of long-distance objects, was not possible until some important conditions were historically realized, around the beginning of the seventeenth century. In fact, certain material requirements, technical preconditions, and philosophical points of no return had to be met not only before the telescope could actually be built but also before it could be recognized and profitably used as such. Among the material requirements, it should be mentioned, first, the acquired competence in the making of glass lenses (both convex and, later, concave) that had to be good enough to allow luminous transparency and visual clearness and, secondly, the development of adequate procedures for glass grinding and lens polishing, necessary for obtaining a correct refraction of the light by the optical medium. Among the technical conditions, it should be mentioned also the not so easily understood principle of aligning different lenses or mirrors for obtaining different visual effects (e.g., a concave lens before a convex one, as in the Galilean telescope, for a magnification of the observed object). Moreover, the basic notions of focus, depth of field, and *punctum inversionis* had to be somehow understood and mastered (as borrowed by, respectively, the practice of eyeglasses-making, the perspectivistic tradition of the visual arts, and the science of burning mirrors) before the functioning of the telescope could be conceived. Among the philosophical points of no return, it should be mentioned the conviction and the awareness that an *instrument* can guarantee reliable and useful results, *even beyond user's own perceptual capacities*: an acquisition that was accepted, against any comprehensible skepticism, even later that the first telescopes were already at work. All these

conditions were satisfactory met in the first years of 1600 in the Netherlands but only after a long “training” and “playing” with spectacle-makers’ lenses, reflecting mirrors, crystal spheres, and *camerae obscurae* in Italy and in England.

In England, Leonard Digges was credited of the conception of a rudimentary reflecting instrument, consisting of a mirror and a concave lens, as reported by his son Thomas in his *Pantometria* (1571), but it remains unlikely that he actually assembled such a prototype. Also John Dee, tutor of Leonard Digges’ son, made reference to some “perspective glasses” in his writings (1575) for military application, and in his *Treatise on the Properties and Qualities of Glasses for Optical Purposes* (1585 ca.), William Bourne described the effects of glasses for distant vision with confidence for their effectiveness and for their forthcoming development.

In Italy, Giambattista Della Porta, in his *Magia Naturalis* (1589), described from a theoretical point of view what will later turn out to be the Galilean telescope, although, for his own admission, without having been aware of the relevance of the invention and its applicative potential.

The Dutch-based spectacle-maker Hans Lippershey was the first to claim of having been “inventor of an instrument for seeing at distance,” namely, a little glass monocular device that he was able to build before the end of 1608. At the same time in which Lippershey applied for a patent of exclusivity to the States General in The Hague, two other Dutch candidates, namely, S. Janssen and J. Metius of Alkmaar, laid claim to being capable of assembling similar working optical instruments. A wide debate regarding the identity of the prime invention was open since then (some decades later, an inquiry was addressed to solve the controversy, and its results, published in *De vero telescopii inventore* (1656), assigned the primacy to Janssen, but revisionist petitions soon followed as well, leaving the debate undated for centuries, cf. van Helden 1977). Anyhow, what will be later baptized as *telescope* (literally the “farseeing,” from Greek *τῆλε* “afar” and *σκοπέω* “watch at”) was finally built and available.

In the spring of 1609, Galileo Galilei had already been made aware of the news by the

Venetian prelate and friend Paolo Sarpi (maybe by the way of a French student, J. Badouère, since at that time the first models of the instrument were already on sale in Paris and in other European cities). In few weeks’ time, Galilei not only understood how the enlarger instrument was made, up to recreate it, but he was even able to enhance it, improving its magnifying power up to 8 measures and, in 2 years’ time, up to 30 measures (equal to the intrinsic limit of that optical structure and its materials). Moreover, he soon improved the quality of lenses’ optical performance, preparing them himself with the excellent Venetian glass; he then added further tools on his longer sight tube, like a diaphragm for controlling the quantity of light on the lenses, a micrometer for calibrating its angulation, and a so-called *Jupiterlabe* for localizing the unforeseen Jupiter’s moons. In his *Sidereus Nuncius* (1610), Galilei publicly announced all the new astronomical discoveries that he made for the first time carefully watching the heavens through his “cannocchiale,” namely, the Galilean telescope, the first of a kind. Since then the progressive and tentative improvement, the instrumental and theoretical research on the telescope, together with the “aperture fever” that it always came with (cf. Watson 2004), has never stopped.

The importance of the invention of telescope cannot be underestimated, neither regarding its instrumental value within the astronomic field during the “Scientific Revolution” (and uninterruptedly after) nor regarding its philosophical and symbolical significance in so far as it was a device – the first with such an huge impact on human knowledge – that was given credit for, and recognized as, being able of increasing natural perceptual capacity well beyond its contingent limits, even enhancing it to a level of improvement that was thought as impossible to reach, even less artificially.

Telesio, Bernardino

Born: 1509, Cosenza

Died: October 1588, Cosenza

Emilio Sergio

Department of Humanities, University of Calabria, Cosenza, Italy

Abstract

Renowned as a “new Socrates” and “the first of the new philosophers,” Bernardino Telesio became a landmark for late Renaissance thinkers and men of science, developing a new approach to the study of the natural philosophy, in contrast to the scholastic Aristotelian tradition, and criticizing the medical science of Galen and of his followers. His thought influenced such eminent authors of early modern philosophy, as Agostino Doni, Giordano Bruno, Francis Bacon, Tommaso Campanella, Pierre Gassendi, and Thomas Hobbes.

Biography

Bernardino Telesio was born in Cosenza (Northern Calabria) to Giovanni Battista, a noble man of letters, and Vincenza Garofalo, the daughter of a lawyer. Bernardino was the firstborn of eight sons. His early education had been influenced by his uncle, Antonio Telesio (1482–1534), a fine humanist whose works

largely circulated across Europe. Antonio took care of his nephew during his journeys to the principal centers of Italian culture. In 1517 Bernardino left Cosenza, following his uncle to the Duchy of Milan. Here the young Telesio became acquainted with the illustrious pupils of his uncle as well as with eminent men of letters, such as Matteo Bandello (1485–1561). In 1523, Bernardino and Antonio moved to Rome, attending the intellectual *milieu* of the papal court and the Vatican library, animated by philosophers and humanists such as Paolo Giovio (1483–1552), Marco Girolamo Vida (1485–1566), Marcello Cervini (1501–1545), Coriolano Martirano (1503–1558), and Giovanni Antonio Pantusa (1501–1562). Bernardino left the *Studium Urbis* in 1527, soon after the sack of Rome. Then Bernardino moved to Padua, where his uncle rejoined him, as he had been appointed professor of Latin by the municipality of Venice (Oct. 17th, 1527). At the University of Padua, Telesio learned the new critical approach to Aristotle and Galen. He never gained the title of *magister medicinae et artium*, and yet he started to cultivate a significant interest in mathematics, medicine, and natural philosophy. After a couple of years, he came back to Calabria. He kept pursuing his studies in the field of philosophy, becoming familiar, in Rome (1534–1535), with the papal environment of Paolo III Farnese. Between 1536 and 1538, he spent a fruitful period of study at the Benedictine monastery of Seminara in the South of Calabria. Then he went back to Rome, getting acquainted with some illustrious members of the papal court: Benedetto Varchi, Annibale Caro, Niccolò Ardinghelli, Ippolito Capilupi, Alessandro Farnese, Gasparo Contarini, Niccolò Gaddi, and Giovanni Della Casa. In the early 1540s, he was already known as an anti-Aristotelian philosopher. Between 1541 and 1542, he spent some time at Padua and was introduced to Matteo Realdo Colombo (1516–1559), who, in his *De re anatomica* (1559), remembered Telesio as *auditor* of his early anatomical dissections (Mandressi 2009, 113). The specific interest of Telesio to the *nova ars medendi* was particularly attested in a work “adversus Galenus” entitled *Quod animal universum ab unica Animae substantia gubernatur* (“That the animal as a whole is ruled

by one soul and his substance”), written along 1560s, and posthumously published by Antonio Persio (Telesio 1590, 139–227).

In the late 1540s, he probably lived in the Neapolitan household of Alfonso Carafa (†1581), III Duke of Nocera, and in the early 1550s, he came back to Cosenza, marrying in 1553 Diana Sersale (†1561), a noblewoman of note belonging to the old municipality of Cosenza. He soon became a leading figure in the intellectuality of Cosenza, putting the basis for the creation of the “Accademia Cosentina” (Lupi 2011). Under his tutelage he had such distinguished pupils, such as the humanist Sertorio Quattromani (1541–1603) and Iacopo di Gaeta (fl. 1550–1600), the philosopher and physician Agostino Doni (fl. 1545–1583), the orientalist Giovanni Battista Vecchietti (1552–1619), and his first biographer, Giovan Paolo d’Aquino (†1612). In 1554 Telesio was elected mayor of Cosenza. Then, throughout the 1550s he had the opportunity to improve the first drafts of his works, and, soon after the death of his wife (1561), he probably spent a second period of study at the Benedictine abbey of Santa Maria del Corazzo (Sergio 2013).

In the early 1560s, he became more familiar with the academic environment of Naples, where the natural philosophy and the medical sciences began to be studied taking into account the works of Vesalio, Colombo, Cardano, Eustachius, Fracastoro, and Jean Fernel. There Telesio probably read the works of Giovanni Argenterio (1513–1572), a professor of medicine in Naples from 1555 to 1560, one of the most important referees for the diffusion of new medical ideas in Southern Italy. Like Fracastoro, Argenterio criticized Galenic theories of contagion and diseases, contributing to the slow downfall of Galen’s authority (Mulsow 1998, 260–272; Siraisi 2011, 329–355; Hirai 2012). Besides, Giovanni Filippo Ingrassia (1510–1580), a physician who received his scientific education at Padua studying with Colombo, Vesalio, Eustachius, and Fracastoro, was recruited as a professor of anatomy (1544–1556). Like Argenterio, Ingrassia gave a great contribution to the innovation of medical science in Renaissance Naples, and certainly, his critical approach to Galen’s works did not pass unseen in Telesio’s sight.

In 1563, Telesio went to Brescia, paying a visit to the Aristotelian Vincenzo Maggi (1498–1564). On that occasion, he submitted to his old friend (whom he had met at Padua in 1528) the manuscript of the first edition of his *De natura iuxta propria principia* (“On the nature according to its own principles”). Telesio’s work was published in Rome 2 years later. By 1565, he also wrote the first of his medical writings, the *Quod animal universum*. The next year was printed a little treatise, *Ad Felicem Moimonam Iris*, about the phenomenon of the rainbow (Telesio 1566).

In the same year of the publication of *De Natura*, Tommaso Telesio (1523–1569) accepted the position of Archbishop of Cosenza, a title initially offered to Bernardino by Pius IV. Along the second half of the 1560s and the beginning of the 1570s, Telesio’s philosophical reputation became more widespread: in 1567 the humanist Giano Pelusio wrote a little poem, *Ad Bernardinum Thylesium Philosophum*, where Telesio was compared to Pythagoras; during the next years, Bernardino was assisted by his disciple Antonio Persio (1542–1612) in the publication of the second edition of *De rerum natura* (1570). In the same year, three libels were printed: *De colorum generatione*, *De his quae in aere fiunt et de terraemotibus*, and *De mari liber unicus* (Telesio 1981). They were printed in Naples, where Telesio lived under the patronage of Alfonso and Ferrante Carafa (†1593).

The 1570s are crucial years for Telesio’s fame: in 1572 Francesco Patrizi wrote a review of Telesio’s *De rerum natura* (*Objectiones*), to which Telesio answered with a letter, the *Solutiones Tylesij*; meantime Antonio Persio wrote a reply entitled *Apologia pro Telesio adversus Franciscum Patritium*; in the same years, Florentin Francesco Martelli translated Telesio’s *De rerum natura*, *De mari*, and *De his quae in aere fiunt*. Between 1575 and 1576, Persio published three works: the *Liber Novarum Positionum* (1575), the *Disputationes Libri Novarum Positionum* (edited by an unknown “Andreas Alethinus,” who collected the philosophical debates *pro* and *contra* Persio held at Padua and Venice in 1575), and the *Trattato dell’ingegno dell’uomo* (1576). By 1577, Patrizi accomplished the writing of *L’amorosa filosofia*, a

dialogue wherein can be recognized that Telesio and Patrizi went through a close friendship and led in Modena the intellectual *milieu* of Tarquinia Molza (1542–1607). In the late 1570s, Telesio came back to Naples, and in the same period, the humanist Bonifacio Vannozi, rector at the University of Pisa, wrote a letter to Telesio, defining him as “our Socrates” (Artese 1998, 191). It is of no little matter that between 1579 and 1580, Telesio went to the monastery of Seminara, as testified in a letter from Angelo Grillo (1558–1629) to the physician Andrea Chiocco (1562–1624), one of Telesio’s adversaries (Sergio 2013, 63–64).

In the first half of the 1580s, living in Naples, Telesio immersed himself in the writing of the third edition of *De rerum natura*, which was published in 1586, dedicated to Ferrante Carafa, IV Duke of Nocera. In that edition, Telesio delivered in nine books the earlier and later topics of his work. During this time, his thought came to be known in England: along his *Grand Tour* in Italy (1581–1582), the mathematician Henry Savile bought a copy of the second edition of *De rerum natura* (Iovine 1998).

Soon after the publication of *De rerum natura*, a Neapolitan lawyer, Giacomo Antonio Marta (1559–1628), wrote a *pamphlet* against Telesio, the *Pugnaculum Aristotelis contra principia Bernardini Telesii* (1587). In that book Marta recalled the debates held in Naples in the 1570s, in which participated the physician Latino Tancredi and the Aristotelians Gerolamo Hurtado and Giambattista Crispo. A fierce attack against that book was moved, a few years later, from Tommaso Campanella, in his *Philosophia sensibus demonstrata* (1591).

On July 23rd, 1587, Telesio came back to Cosenza, making his will, probably because of his bad health conditions. In Cosenza, he died the next year (October 1588).

Heritage and Rupture with the Tradition

Telesio’s natural philosophy can be read as a consequence of a new epistemological approach to the studying of nature. This approach does not depend uniquely on his alleged modern

“empiricism” (Giglioni 2010). Telesio’s principal aim is to inquire about the causes of natural phenomena getting rid of all the metaphysical speculation of the Aristotelian tradition. As he stated in the *incipit* of book I of the second edition of *De rerum natura*, “the construction of the world and the nature of the bodies contained in it should be not inspected by reason, as the Ancients did, but must be perceived by sense, and grasped from things themselves.” He does not belittle the role of reason; and yet he declined to attribute reason a primary role, where more direct evidence can be grasped from the senses. The beginning of his natural philosophy is the experience deriving from the sense perception, being the *sensus* the cognitive power closer to the nature of things than reason itself. The perception of a physical object establishes a causal relation to the object, which nature has to be investigated in physical terms. Antagonizing Aristotle, Telesio affirms that the ability of the percipient to reach a knowledge of the natural things is not “actualized” by the form of the perceived thing. At the same time, he does not believe that all acts of sense-perception simply mirror the natural beings of the external world; rather, he thinks that knowledge of the world is affected by the sensible data of the sentient; and that kind of affection is the very starting point to reach the knowledge of the world, because of the universality of *sensus* (the *nature* of the sentient is not different from the *nature* of the things perceived by him), and, what’s more, the sentient experience can be eventually corrected by the same kind of experience. In that perspective, Telesio abandoned the traditional doctrine of species (sensible and intelligible), denying that natural things are the result of the combination of matter and form. According to Telesio, the Peripatetic explanation to the problem of the human knowledge left unsolved the relation between the causes and the effects in the cognitive process.

Reasoning is nothing but the outcome of the self-organization of the “material soul” (*spiritus*) in cooperation with the “ways” or “means” of sense perception and the principal functions (memory, feelings, imagination) of the brain activated by the same principle of material soul. Telesio combined the Stoic notion of

“self-preservation” (*conservation sui*) (identified with the sensation of pleasure) with the key function of the spirit in the self-preservation of the health of the body (Telesio 1586, VII.3).

Telesio did not directly challenge the theory of intelligible species of scholastic tradition; however, he indirectly criticized it through the principles of his psychology. They can be accounted for as follows: (1) the intellectual cognition is based on a perceived similitude, which does not consist of a mental representation of an external object resulting from the encounter between the active intellect and passive sensation; rather, sense perception is an active operation of the material soul (Telesio 1586, V.34–47); (2) the sensible data coming from the percipient has a cognitive role (as Campanella and Hobbes later explained, the *sensus* is already a kind of *iudicium*); (3) the material agents involved in the cognitive process, from the “ways of sense” to the spiritus (“anima sentiens”) are merely corporeal (Telesio 1586, V.3–5, 10–12); and (4) the spirit is able to perceive because it can be subject to bodily alterations. In conclusion, Telesio’s naturalistic program took sensation as a material process involving exclusively material agents: the sensible objects, the “ways of sense,” and the *spiritus*.

Stating that the animal is ruled by one substance residing in the brain, Telesio abandoned Aristotle’s psychology and his threefold partition of the soul (intellective, sensitive, vegetative), as well as Galen’s partition of “pneumata” (animal, vital, natural) and his theory of “temperaments” (Telesio 1570, II.15). He also accused Galen of relying on abstract reasoning rather than sense perception and experience. Finally, electing the seat of the spirit to the brain, he rejected Aristotle’s biological cardiocentrism (Telesio 1586, V.27).

All natural things are the result of the antagonizing of two active forces, “heat” and “cold.” They make possible the creation of the inanimate and animate beings. The heat is responsible for the phenomena of elasticity, warmth, dryness, combustion, lightness, and rarefaction of the matter, as well as of the motion-velocity of the bodies; the cold is responsible for the slowness of

the bodies in motion, of their condensation, freezing, and hardness. All the other natural phenomena (such as humidity or fermentation) are the result of the combination of different degrees of heat and cold. The interaction of heat and cold affects the nature of matter itself, a notion that Telesio intentionally left unclear (Schuhmann 2004).

Against Aristotle, Telesio denied the theory of the *locus* as a limit of the body, taking into account the Lucretian theory of space as an empty place filled by the bodies. By means of the two forces of heat and cold, and affirming the idea of an absolute space, Telesio abolished the Aristotelian theory of a cosmos divided into a sublunary world, in which generation and corruption take place, and a superlunary world with timeless regular movements (Telesio 1565, I.35–38). What’s more, he moved a critique to the Peripatetic theory of natural locus pointing out that Aristotelians did not well explain the reason why the motion of the heavy bodies becomes uniformly accelerated (Telesio 1565, I.45–46; Telesio 1570, I.46).

Telesio chose heat and cold as the principal agents for the knowledge of the world because they are directly perceived by the sentient and immediately affect the body and its functions. At the beginning of the world, two primary bodies have been created, the sun and the earth. The former is the seat of heat, and the latter is that of cold (Telesio 1565, I.1–4). Life itself depends on the right balance of heat and cold. Heat and cold are finally called *agentium naturarum vires* (Telesio 1586, VII.9). Telesio is firmly persuaded that the world depends on the inner uniformity of nature and on its intrinsic virtue or “wisdom” (Boenke 2013).

In 1586 *De rerum natura*, Telesio introduced the existence of two kinds of soul, a “material soul” (*e semine educta*) and a divine soul (*a deo immissa*), pointing out that the latter has been uniquely given by God to the human beings. That distinction does not undermine the basis of his theory of knowledge; the divine soul is unable to ratiocinate without the sensible soul, and its contribution to the knowledge of the world is way long inferior to that of sense perception (Telesio 1586, V.2–3, VIII. 15).

Impact and Legacy

During the last decades of the sixteenth century, Telesio had a remarkable impact on Italian and European philosophers. In 1588, Francesco Muti published a work entitled *Disceptationum libri V contra calumnias Theodori Angelutii in maximum philosophum Franciscum Patritium, in quibus pene universa Aristotelis philosophia in examen adducitur*, in which he defended Telesio, taking in consideration the quarrel that took place at Ferrara along 1584 and 1585 between Patrizi and Angelucci. Just a year before, in 1587, the Spanish philosopher Oliva Sabuco de Nantes y Barrera published a book, *Nueva filosofía de la naturaleza del hombre*, where she elaborated a psychophysiology of the human body deeply influenced by Telesio's doctrines (Bidwell-Steiner 2010). In 1589, Sertorio Quattromani, the new founder of the "Accademia Cosentina," published a summary of Telesio's thought, *La filosofia di Berardino Telesio ristretta in brevità e scritta in lingua Toscana*; meantime in his *Philosophia sensibus demonstrata* (1591), Campanella wrote a sharp defense of Telesian philosophy against Marta's *Pugnaculum Aristotelis*. Another early modern thinker, Alessandro Tassoni, devoted some pages of his works to Telesio's meteorology (*Dieci libri di pensieri diversi*, 1620); and Florentin Ludovico Delle Colombe, in his *Contro il moto della terra* (1601–1611), tied Telesio's followers ("i Telesisti") to Galileo's thought (Bondi 2018, 35–36).

In the early decades of the seventeenth century, Telesio's thought had some positive feedback and critiques from a significant number of philosophers and freethinkers. Francis Bacon devoted some pages of his writings to Telesio: formerly in his *Advancement of Learning* (1605), then in his *De principiis et originibus* (1613), and finally in his *Sylva sylvarum* (Rees 1977; De Mas 1989; Bondi 2001, 2018; Garber 2016).

In the French context, some traces of Telesio's legacy can be found in such authors as Marin Mersenne (1623), Gabriel Naudé (1625 and 1627), Jean-Cécile Frey (1646), Charles Sorel (1655, 2nd ed. 1668), and Pierre Gassendi (1658). Even though on more than an occasion Telesio is

mentioned among a group of Renaissance thinkers (such as Cardano, Patrizi, Doni, Ramus, Bruno, Campanella), his fame as one of the most important sixteenth-century *novatores* was widely recognized along the seventeenth century (Garber 2016).

A specific debt toward Telesio is accountable in Thomas Hobbes. In the first chapter of *Leviathan* (1651), Hobbes openly rejected the doctrine of species, and in the successive chapters, he asserted a cohesive relationship between sense, imagination, and reasoning, close to Telesian approach. What's more, the notion of "self-preservation" (*conservatio sui*) is reassessed in Hobbes's anthropology. Telesio's influence became more explicit in 1655 Hobbes's *De Corpore* (Schuhmann 1988).

Textbooks of Philosophy in the Renaissance

Anja-Silvia Goeing
Harvard University, Cambridge, MA, USA
University of Zurich, Zurich, Switzerland

Abstract

The textbook is defined by its use in educational environments: in schools of different levels, in tutorials at home, or in universities. Any change in these environments also had an effect on the educational material employed: the fate of religion, the curriculum of Latin schools, the politics of towns, or the death of one teacher were all important for what was taught and how texts were implemented in class. One of the most significant changes, however, took place outside the confines of the learning environment: the advent of the printing press in the second half of the fifteenth century had a massive influence on the production and use of textbooks in all disciplines. From about 1480, five striking innovations in teaching affected the production and use of philosophical textbooks in academic environments. All of them were supported by the advent of the printing press. First, teachers figured more and more as authors and commentators in their own right. Second, new forms of organization created new formats of textbooks. Third, reference books such as compendia and encyclopedias were not only written for every discipline, but they were also enhanced with illustrations. Fourth, students started to comment on and distribute their teachers' lectures, and some of these editions then featured as the next generation of textbooks. Finally, with mathematics and physics branching out into experimental fields from the

second half of the sixteenth century, mathematical and mechanical tools and chemical devices were discussed in lectures, creating new sets of illustrated manuals as textbooks.

Heritage and Rupture with the Tradition

The textbook is defined by its use in educational environments: in schools of different levels, in tutorials at home, and in universities. Textbooks served as catechisms for mature converts to Christianity, as language courses for immigrants, and as manuals for the introduction of new technologies (Grafton 2008, 15–16). Consequently, any change in the teaching environment also had an effect on the material employed: the fate of religion, the curriculum of Latin schools, the politics of towns, or the death of one teacher were all important for what was taught and how texts were implemented in class. One of the most significant changes, however, took place outside the confines of the learning environment: the establishment of paper manufacturing, the advent of the printing press in the second half of the fifteenth century and with it the rising book markets, as well as new distribution and organizational techniques, had a massive influence on the production and use of textbooks in all disciplines (Blair 2021, Pettegree 2010).

The philosophy curriculum underwent changes in the Renaissance: on the one hand, Gregor Reisch's widely used *Margarita philosophica* (1503) increased the seven liberal arts by adding ethics and physics; on the other hand, in universities and advanced schools philosophy teaching was reduced to Aristotelian logic, ethics, physics, and metaphysics courses (Cfr. Facca 2020; Omodeo and Wels 2019). According to the Zurich polymath Conrad Gessner (1516–1565), philosophy was included in all disciplines. He divided the arts curriculum into primary and secondary parts: the primary part consisted of ethics, physics, and metaphysics, while the secondary part consisted of philosophy's more practical ends: the physics served by medicine, the oeconomia served by politics, and finally the ethics that was served by

both politics and oeconomics. Dialectics, or logic, and mathematics, the medieval domains of philosophical thought, were classified by Gessner not as ends in themselves, but merely as tools that help us to think (mathematics) or to teach (dialectics) (Gessner 1586, 3). This was by far not the only way of classifying the disciplines pertaining to philosophy at the time: the Cambridge curriculum of 1570 included (Aristotelian) ethics in the philosophy course, but not, however, logic (Feingold 1997a, 213). This entry recognizes that all disciplines of the enhanced arts curriculum were interrelated, but uses the term philosophy in the pre-Gessnerian sense adopted by the Wittenberg professor of philosophy Johannes Bernhardi (Velcurius) (Velcurius and Schegk 1542). He taught Aristotelian natural philosophy as well as rhetoric and published commentaries on Erasmus's *De copia* (1534), as well as on Aristotle's *De anima* (1537) and *Physica* (1538); however, he used the term "philosophy" only for his exegesis of Aristotle's work. This entry also recognizes that the sixteenth and seventeenth centuries witnessed a broadening of authorities, and that the traditional Aristotelian domains were contested in university teaching by other philosophical directions, as, for example, Stoic moral philosophy (Kraye 2008).

All disciplines of the liberal arts in Renaissance and early modern European schools of higher learning, including logic, physics, ethics, and metaphysics, drew on and transmitted the classical and medieval heritage. Although curricula changed gradually throughout Europe, from Martianus Capella's *Marriage of Philology and Mercury* (fifth century) up to the broad academic reception of mathematical, observational, mechanical, and chemical novelties in the mid-seventeenth century, the contents and modes of access were dependent on what happened locally. What was taught in schools was influenced by European networks of taste, as well as by fashions and regulations that differed locally, from school to school. Other factors determining the curriculum were the religious and economic interests of the towns or rulers. Courses could be streamlined on a local level by the use of commentaries and epitomes of classical literature, written and

distributed (orally, in manuscript, or in print) by university or school teachers and their students, who would hand out their transcripts to interested parties, often, in the early period of printing, in unauthorized editions. Nancy Siraisi (2008) opened up this field of inquiry by examining some unauthorized, printed lectures on practical medicine which, having originally been delivered orally by Girolamo Mercuriale to students at the University of Padua in the sixteenth century, were distributed to the medical community at Lyon in 1627.

The book supply at Oxford University, which has been extensively studied, reveals some examples of how textbooks were used in late medieval and early modern times. Usually, even in the very early years of the university, arts professors wrote textbooks for themselves and their colleagues, as a preparation for teaching or as a contribution to learned debates. Arts students and those studying for the philosophy baccalaureate did not need textbooks for their classes, since lectures were dictated to them, and they were supposed to prepare arguments orally in class, which were called *reportationes*. Outside class, collections of *reportationes* were in high demand. Students exchanged and enhanced copies very rapidly, thus defining a new type of textbook in the fourteenth century (Parkes 1992, 407, 427).

Students in the higher faculties of medicine, law, and theology did use textbooks in their courses. Professors wrote summaries of ancient and medieval texts and gave these out for scribes or students to copy in whole or in parts (the *pecia* system). In class, alongside *reportationes*, students were supposed to gloss their copies of set-texts with commentaries dictated by professors or to collect useful sayings in their notebooks (*florilegia*, *topoi*, *loci*), a practice also adopted by arts students (Parkes 1992, 408). All these methods continued with the advent of the printing press. Roughly from the end of the fifteenth century, textbooks were also introduced in the arts curriculum, and students soon began to write down notes from printed or manuscript set-texts in all their courses (Moss 1996, 147–9). Furthermore, *reportationes* adapted rhetorical methods and were transformed into *disputationes*, a genre

that Philipp Melanchthon pioneered with great success, though only for a short time, at Wittenberg University (Haussleiter 1897).

Innovative and Original Aspects

Beginning around 1480, five striking innovations in teaching affected the production and use of philosophical textbooks in academic environments. All of them were supported by the advent of the printing press. First, teachers figured more and more as authors and commentators in their own right. Second, new ways of organizing knowledge produced new textbook formats, replacing inherited genres such as the commentary or the lemmata edition. Third, reference books such as compendia and encyclopedias were written for every discipline, often enhanced with illustrations, aimed at enticing readers. Fourth, students started to comment on and distribute their teachers' lectures, and some of these editions then featured as the next generation of textbooks. Finally, with mathematics and physics branching out into experimental fields from the end of the sixteenth century, mathematical and mechanical tools and chemical devices were employed in lectures and illustrated in manuals and textbooks.

Teachers used textbook formats that not only included the set text and a set of classical commentaries, as was customary from the thirteenth to the fifteenth century, but also their own contribution. Starting in Italy with the first humanist schools in the first half of the fifteenth century, teachers such as Guarino Veronese and his son Battista Guarino wrote, produced, and distributed their own textbooks first in manuscript (Guarino 1459; See Bolgar 1954, 270) and later in print, often sharing the costs and profits with the printer. One of the first well-documented cases of shared-cost printed textbooks involved the London teacher William Horman, who had the printer Richard Pynson print 800 copies of his textbook *Vulgaria*. The contract, dated 28 June 1519 (Furnivall 1868, 3), stipulated that Pynson would use three different typefaces and sufficient paper for the enterprise. He also promised on oath not to

print more than the prescribed number of copies within the next 5 years. The contract states, furthermore, that Horman would pay for the production of the book. The payment for each ream of paper was five English shillings, to be paid in two tranches: the first by delivery of the 800 copies for the payment of 500 copies, and the second a year after delivery. By participating in the production of the textbook and bearing some of the marketing risk, the teacher became a kind of entrepreneur helping to sell copies of his own work. Teaching thus became relevant not only to advancing the knowledge of the student but also to selling the teacher's books. This economic by-product might have shaped the professional habits of teachers, who would be keen to recoup their investment. Printer did not take over the role of book producers; they remained craftsmen and stationers, who provided their services in order to finish a product, for which the commissioner bore the main responsibility.

One feature of the new formats was to organize a large amount of newly accessible information, as in Gessner's *De anima* commentary (1563). For his discussion of Aristotle's notion of hearing ("de auditu"), Gessner included notes based on 51 treatises by classical and contemporary authors (Goeing 2013). Classification tables and systems of keywords, called *loci communes* or *topoi*, helped readers to find their way from one argument to another. A fruit of the new techniques were new formats with more or less pedagogically informed functions: individual commentaries led the reader from the more general to the more detailed and from easier to more complex notions, often accompanied by tables and abbreviated text editions (Lines 2008, 199). They could be read without the Aristotelian text, while published lemmata editions had to be read with the original text, explaining it sentence by sentence. Finally, illustrations and schemata ornamented incunabula textbooks throughout Europe, such as Peter of Ravenna's *Phoenix or the Art of Memory* (Peter of Ravenna 1491) or early mathematical treatises, including new editions of Archimedes and Euclid. Until the end of the sixteenth century, many textbooks of physics were also illustrated: subdisciplines of physics, that had merged with

mathematics (Kepler 1609), or medicine, a field for which Andreas Vesalius had collected and published illustrations on the human anatomy as early as 1543 (Carlino 1999; Margócsy et al. 2018).

Reference books such as compendia and encyclopedias were produced and used by scholars to facilitate access to various sources of information, whether other books or objects of nature and art. Authors collected material and experimented with different classification systems to store and organize the gathered information with combinations of alphabetical and topical listings. Petrus Ramus and his followers such as Theodor Zwinger in Basel worked out another distinctive system of classification: Zwinger built up an identification system in his *Theatrum vitae humanae* (Zwinger 1565) and connected descriptive adjectives by association to lead to a place and classification that he had given to the object or abstract thought in his labyrinth of knowledge (Blair 2010, 173–229). These reference books not only adorned the private libraries of wealthy scholars but were also used for teaching, as Ulisse Aldrovandi's practice at the University of Bologna shows: according to a note from 9 November 1566 in his personal copy of a compendium on natural philosophy selected and summarized by the Franciscan Frans Titelmans, he explicated this book to a Flemish student, Prince Charles of Tournai. Titelmans' reference book came out first in 1530 in Louvain, followed by many more editions in the sixteenth and seventeenth centuries published all over Europe. The exemplar that Aldrovandi used was a 1551 edition published in Lyon (Lines 2008, 195).

Illustrations enhanced and highlighted the characteristics of classification and identification systems, especially in works of natural philosophy. Gessner's illustrations in his encyclopedias on the different realms of nature, from animals and fish to stones, were printed with woodprints (Berger 2017; Fischel 2010). He used the pictures as a means to identify classes and species, a categorization scheme that was later perfected by Carolus Linnaeus (Linnaeus 1735). More refined techniques for illustrated reference books included copper engravings. A sixteenth-century

encyclopedia of fish with very refined illustrations, made from copper engravings, was Ippolito Salviani's *Aquatilium animalium historiae*, published in 1554 in the artistic center of Rome (Salviani 1554).

Students started to comment freely on their teachers' comments and to distribute their own comments, mostly in letters as part of the *Republica letteraria*. This helped to shape the second and subsequent generations of commentaries (Goeing 2009). Ruptures caused by wars – the Thirty Years' War, 1618–1648, in mainland Europe and the Civil War in England – led to reformulations of the entire curriculum of higher learning and shed new light on subjects such as law (including politics), with implicit effects on topics discussed in philosophy: new textbooks were composed for economic and political issues in philosophy, such as those written by John Locke and Thomas Hobbes (Hobbes 1650a, b; see Feingold 1997a). Finally, with mathematics and physics branching out into experimental fields from the end of the sixteenth century (Feingold 1997b), mathematical and mechanical tools and chemical devices were integrated into lectures, creating new sets of illustrated manuals used as textbooks. Gessner's *Thesaurus Evonymi Philiatrī* (Gessner 1552) was one of the first manuals on how to build a distillation apparatus to appear in an educational environment. It came out in many editions, and Peter Morwen, a fellow of Magdalen College, Oxford, translated the book into English as early as 1559.

Impact and Legacy

Textbooks and reference works had a huge impact on learning and the distribution of knowledge. Writers were responsible for the language and translations not only of newly edited ancient texts but also of their own works. Organizing bibliographical material into reference books, the idea of the encyclopedia was the foundation of modern learning. And finally, collections of books formed large libraries and were displayed in the cabinets of curiosity that we today admire as the beginning of public libraries and museums.

► Wonders in the Renaissance

Theaters, Renaissance

Malcolm Hebron

Winchester College, Winchester, UK

Abstract

Between the disintegration of the Roman Empire and the sixteenth century, dramatic performances, provided by itinerant entertainers, took place in found spaces such as halls, inn yards, fields, and town squares. In liturgical drama, representations of biblical narratives moved out of the church into public spaces.

The Renaissance saw the introduction of the indoor theater, at first in temporary makeshift structures and later in permanent independent buildings. Italian architects studied Vitruvius and examined the remains of ancient theaters. The proscenium arch theater became the dominant model for later centuries. Theaters developed spectacular scenic effects, appealing to the senses and emphasizing perspectival vistas. From being a largely improvised and participatory experience, drama in the theater evolved into a fixed product in a fixed space, with the world of the play clearly demarcated from the audience.

At the same time, Renaissance theater in the public sphere stayed close to its popular base and drew on older traditions of stagecraft. The magnificent architecture and ingenious effects of Renaissance theater draw attention to themselves, in a striking parallel to metaphors in dramatic texts, which frequently comment on the illusory nature of the theatrical experience, and notions of reality and illusion more generally.

Heritage and Rupture with the Tradition

After the disintegration of the Roman Empire, official theater ceased. Itinerant entertainment continued (though evidence is limited), preserving some aspects of late antiquity: similarities have been noted, for example, between the stock types of late Roman farce, the *fabula attelata*, and the characters of the *commedia dell'arte*, active from the mid-sixteenth century (Chaffee and Crick 2017). Another medieval entertainment was the courtly spectacle, such as a triumphal entry or wedding celebration. Performers of all kinds used found spaces rather than purpose-built structures (Brockett and Hildy 2010).

Liturgical drama began within churches. To edify the laity, aspects of liturgy and biblical narrative were enacted. Small booths called mansions were placed along the nave to represent locations for different episodes. Later the staging moved to the west door of the church and thence into public spaces such as market squares. For these performances, the text was in the vernacular, and acting was entrusted to laymen. Staging varied. As small

symbolic enclosures serving as curtained entrances, mansions were retained. Sometimes they were placed close together, while in England movable wagons were used to represent different settings in mystery cycles, telling the Christian story from Creation to Doomsday. Morality plays, enacting instructive tales, were played on makeshift platforms before fixed facades. In Cornwall are found the remains of round outdoor theaters, used for morality dramas (Wickham 1959, 1987). In Spain, wagons (*carros*) brought essential properties to an improvised stage (Brown 2001).

Medieval performances were typically generically mixed: farce, gravity, and satire might all be present in a retelling of the story of Noah. Realistic behavior and colloquial idiom existed alongside an elaborate tradition of symbols and visual rhetoric. Theater was movable and participatory, involving interaction between the audience and performers. These traditions continued in the public theaters of the Renaissance, particularly in England and Spain, where the classical model was less strongly enforced. The classical revival in Italy, sponsored by ducal courts and learned academies, introduced a new kind of theater, separating the space of actors and audience and providing elaborate scenic effects (Vince 1984; Cairns 1996, 1999).

Innovation and Original Aspects

Renaissance humanism brought with it an interest in the theaters of antiquity. Late fifteenth-century illustrations show performances of the plays of Terence using medieval mansions, linked together as in a street, but with the classical addition of framing columns, a possible origin of the proscenium arch. Inspired by the discovery of Vitruvius, temporary theaters were designed (e.g., by Serlio in Vicenza, 1530s) for the use of courts and academies (Hartnoll 1983).

The chief innovation in the Renaissance was the indoor theater (Hewitt 1958). The recovery of the *De architectura* of Vitruvius inspired the treatises of Alberti (*De re aedificatoria* (1443–1452)) and Serlio (*Trattato de architectura*, 1545). The

first permanent indoor theater was the Teatro Olimpico, Vicenza (1585), designed by Palladio and completed by Vincenzo Scamozzi. Here a shallow stage is backed by a monumental *scaenae frons* (the Roman scene behind the stage). This takes the form of a colonnaded facade with five entrances, each one giving a street vista. Considerations of perspective are equally important in Scamozzi's *Teatro all'antica* at Sabbioneta (1588–1590), the first indoor theater in a separate building. Here, the *scaenae frons* is abandoned and the open stage itself forms a single architectural vista. The first proscenium theater, framing the stage like a picture with an elaborate arch, was the Teatro Farnese (1618), designed by Giovanni Battista Aleotti. Perspective creates privileged spaces in the auditorium. While the multiple vistas of Vicenza suggest the equality among academicians, the single-point perspective of the proscenium theater privileges the central viewing position, a space occupied in Europe by the monarch or other noble patron, enjoying *l'oeil du prince*, looking directly to the vanishing point. The Teatro Farnese was the prototype of European theater for the next 300 years (Mulryne and Shewring 1991).

In France, public theaters, such as the Hôtel de Bourgogne (1548), tended to be long and narrow with the audience distributed between pit and gallery. French court theater was designed by Italian architects, providing vast structures and elaborate scenery for an elite audience. The first proscenium theater in France was the Palais Cardinal (later the Palais Royal) built for Cardinal Richelieu (1641). In Spain, where the theater attracted popular audiences and writers of genius from the 1570s, spaces were simpler, following the native model of *corrales* – stages with backdrops set up at the end of squares. Indoor theaters in Madrid and elsewhere were an elaboration of this model (Thacker 2007). In England, London saw its first purpose-built outdoor theater with The Theater (1576), later reconstructed as The Globe (1599), home to Shakespeare's company The Lord Chamberlain's Men. These were followed by other structures, with a polygonal design which has been compared to Roman amphitheaters, arenas for bearbaiting, and inn yards. Indoor theaters in

London, such as two theaters created from the former Blackfriars Dominican Priory (first theater 1576–1584; second, 1596–1642) provided more expensive entertainment. This was taken to an extreme in the lavish masques created by Ben Jonson and architect Inigo Jones for the court of James I in England (Butler 2009).

Impact and Legacy

The prevailing notion of a theater today is a custom-made building, producing some kind of enacted secular narrative. To a considerable extent, this model derives from the Renaissance. Indoor theaters saw the elaboration of lavish scenery, with courts competing to procure the services of the finest architects and craftsmen. The new courtly genres of pastoral, opera, and masque exploited this kind of display and spectacle frequently dominated text (Román 2001). From being partly improvised and collective, the play in indoor theaters became a more prefabricated product, spatially removed from the audience. Perspectival scenery supplanted the limited stages of medieval theater, and realistic illusion took the place of verbal description and symbolic properties. The expense of the form linked it to patterns of wealth and power: though configurations have changed (the cheap pit has become the expensive stalls), different parts of a theater remain a marker of social status.

At the same time, the popular theater maintained many older traditions: the *commedia dell'arte* and traveling companies across Europe preserved the practices of medieval players (such as multi-skilled performers), while the character types of earlier drama can be clearly seen in the plays of Shakespeare and Lope de Vega. In Renaissance theaters, illusion on stage echoes the frequent theme of illusion in dramatic texts. Renaissance drama is rife with metatheatrical metaphors, elaborating the idea that “All the world’s a stage” and exploring the gap between outward show and inward sincerity and truth (Maus 1995). Both theater design and dramatic writing evoke a deep self-consciousness about the illusory experience of theater and life itself.

Theology, Renaissance

Gianluca De Candia

Seminar für Philosophische Grundfragen der Theologie, Katholisch-Theologische Fakultät, Westfälische Wilhelms-Universität Münster, Münster, Germany

Abstract

Renaissance theology is characterized by a profound demand for renewal that affects both academic theology and the theology pursued outside theological faculties.

In the fifteenth century, alongside the two greatest currents of scholastic theology, Thomism and Scotism (the *via antiqua*), Ockhamism (the *via moderna*) becomes more and more significant. The latter argues for a clear separation between metaphysics (as the science of being) and theology (as a practical science) and reaffirms the primacy of divine will (*potentia absoluta Dei*) over every effort of natural reason. In the early Renaissance, theological Ockhamism, as well as the Scotist notion of *distinctio formalis*, would give rise to a kind of hypothetical and formal theology. This “degeneration” of theological hermeneutics would contribute to a widespread demand for unification and essentiality that emerges, though in different ways and different degrees, in the movements of spiritual renewal, in the Platonic theology, in the project of biblical humanism, and in the Protestant Reformation.

Luther’s thesis of justification by grace through faith goes hand in hand with a radical mistrust of man’s natural forces and thus of reason. Against Luther’s antimetaphysical prohibition, the Catholic Church responds with a renewed return to scholasticism (second scholasticism), first by the Dominicans and then the Jesuits. A certain continuity between the natural order of reason and the supernatural order of faith, between metaphysics and revealed theology, is reestablished in the *Disputationes Metaphysicae* of Francisco Suarez (1548–1617). Returning to Scotist teachings, Suarez identifies the appropriate object of metaphysics with the concept of *ens* (as genuinely *transcendens*), in which both infinite being (God) and finite being are comprised, each according to its own order. The *Disputationes* would not only be imported into the reformed *Schulmetaphysik* that distanced itself from Luther’s skepticism about the natural reason but would also contribute to the birth of modern ontology itself.

Heritage and Rupture with the Tradition

In the long period of time that goes under the name of Renaissance (1350–1650), theology goes through a season of extraordinary richness and complexity. The historical-political scenario that brings about and influences the different paths traveled by theological reflection in these three centuries is marked by a climate of uncertainty and radical novelties. The period opens with the great epidemic of plague which, between 1347 and 1353, exterminates almost one-third of the European population, and it is marked by the crisis of unity affecting the major late-medieval institutions (the monarchies and the Church), which will lead to the affirmation of the national states, to the failure of reconciliation attempts between the Eastern Church and Western Church, and to the division between the Roman Catholic Church and the Protestant Churches.

Even the boundaries of the known world change: if the fall of Constantinople, in 1453, marks a setback in the expansion to the East, the

discovery of America (1492) opens new possibilities to the West and gives rise to an extraordinary season of exploratory journeys around the globe. The contacts with the East would then find new vigor not only through the reports from these journeys but also through the work of the missionaries of the newborn Company of Jesus (approved by Pope Paul III in 1540 with the bull *Regimini militantis ecclesiae*), whose writings would bring to Europe the echo of those distant worlds.

There are also many cultural factors that helped shape the various faces of Renaissance theology. Some of them are, so to speak, internal to school theology itself, others refer to religious practice, and others relate to important cultural innovations which, although not originating in theological reflection *sensu stricto*, changed it profoundly. Think, for example, of the transformation of scholastic theology from the *via antiqua* to the *via moderna*; the need for renewal expressed by the *devotio moderna* (fourteenth to fifteenth centuries); the explosion of mysticism in German (fourteenth), Flemish (fifteenth), Spanish (sixteenth), and French (seventeenth) ground; the troubling events in the Papacy and Roman Curia ending with the Protestant Reformation and the Counter-Reformation; the humanists' philological claims; the rediscovery of Plato and the Neoplatonists; the cosmological rethinking by Copernicus and Galileo (in sharp discontinuity with the Aristotelian physics); and the resulting challenge of forming a scientific method.

To properly grasp the movements of Renaissance theology, it is, therefore, necessary to abandon historiographical schemes that are excessively neat, whether from a chronological or from a disciplinary point of view. In fact, the relationship between the Late Middle Ages and the Humanist-Renaissance era is much better understood as "continuity in discontinuity" and "discontinuity in continuity" (Leinkauf 2017, 17) than as the clear fracture that has long been depicted in historiography. This is the criterion that should be applied to both areas where theological discourse takes place during Renaissance: inside the universities and *studia generalia* of religious orders and outside the traditional

academic institutions, that is, in the intellectuals' philosophical-theological writings.

In the Renaissance, the *scholae* remain the privileged centers for teaching and studying theology and, by virtue of that role, the place of continuity with respect to tradition. Yet they themselves will become the place of renewed debates and the necessary condition for the revival of scholastic theology, as the case of Salamanca demonstrates. And similarly on the other side, the *novatores* will place themselves in clear discontinuity with the formalism and the *verbositas* of scholastic disputes but nevertheless will continue to use and be inspired by that same scholastic theology, whose contents and images date back to the Church Fathers. It should be remembered, furthermore, that in the Renaissance, theology, philosophy, and textual criticism (and also the natural sciences) were not disciplines studied and practiced by distinct people. Not infrequently, Renaissance intellectuals were dealing with many of these areas simultaneously. Therefore, a novelty introduced in philosophical, literary-critical, or scientific fields had unavoidable repercussions on theological thought and vice versa. Any historian of Renaissance theology must take into account these interactions.

The task of providing a brief introductory summary inevitably implies some choices. Here the two major focal points will be (1) the theology of the schools (universities and the *studia generalia* of religious orders) as a clear example of a "break" in continuity and (2) innovative aspects of theology developed outside the schools and their influence on "institutional" theology.

School Theology Between *Via Antiqua* and *Via Moderna*

As far as the province of university theology is concerned, between the fifteenth and sixteenth centuries, the two great lines of scholastic theology, Thomism and Scotism, continue (the *via antiqua*). At the same time, the so-called *via moderna* – that is, the theology that harks back to the teaching of William Ockham (1285–1347) – is establishing itself in an ever more significant way (D'Onofrio 1995). In opposition to the *via antiqua* – that is, to the "way" of a

realism of universals ante rem – according to Ockham, universal names represent determinations that are purely conceptual (De Libera 1999). According to the *princeps nominalium*, therefore, universal names imply nothing about the existence or nonexistence of anything: the concept is thus reduced to a logical element (*signum*), to a “name”, which points to reality only by virtue of convention. This rejection of the reality of universals on a metaphysical level introduces a situation of uncertainty that no longer has to do merely with the gnoseological realm but that also affects moral principles and extends even to the realm of soteriology (Oakley 1961; 2002).

As far as the constitution of theology is concerned, with Ockham, the Thomist conception of theology as a science – already criticized by Scotus (1265–1308) – is brought to a crisis. Against the Thomist attempt to adapt a definition of theology to the Aristotelian concept of science, Scotus redefines both the distinction between metaphysics (speculative science) and theology (practical science) and their relationship: metaphysics provides theology with the subject it needs, the infinite entity, which it can give a philosophical demonstration. Conversely, according to Ockham, who radicalizes Scotus’s positions, philosophy is the science of being and is based on reason and experience (speculative science), while theology is the science of God and is based on revelation and therefore on Sacred Scripture (practical science). In contrast to what Scotus affirms, therefore, Ockham declares that the conceptual representation required by theology does not derive from metaphysics but only from revelation. The clear separation between the two different orders of knowledge brings theological discourse to place greater emphasis on the primacy of Scripture and consequently to focus on the unfathomable and absolute divine will. This last doctrinal aspect will have an immense influence on Renaissance Ockhamism – as demonstrated by the extensive discussions dedicated to the theme of *potentia absoluta Dei* (Oberman 1960). The reasons which led Ockham to detach theology decisively from the essentialism and intellectualism native to the Greek-Arabic Peripatetic tradition, and to valorize, consequently, a

version of the absolute power of God verging on pure arbitrariness, can be identified in an event that marked a real turning point in late-medieval theological debate.

In 1277, Bishop Tempier of Paris, with the help of a commission of theologians he established, condemned any mingling of theology with Peripatetic determinism (Hisette 1977; Piché et al. 1999). The Aristotelian vision of the God-world relationship, in fact, imposed a necessitarianism incompatible with the Christian doctrine of God as free Creator of the world and consequently set a limit to God’s omnipotence. Aware of these problems, Duns Scotus first proposed a redefinition of the logically possible (and consequently of the Aristotelian relationship between necessity and contingency) in the light of which the status of essences was redefined. In this way, he managed to interrupt the millennium-long tradition that had necessarily linked these eternal models of reality – i.e., essences – with the divine intellect (Hintikka 1973; Knuuttila 1981). Furthermore, by retrieving the distinction between *potentia ordinata* and *potentia absoluta* – actually already (Courtenay 1990) present in a number of twelfth-century debates – Scotus restores the divine will’s priority over the intellect, rendering it meaningless to search for any foundation for divine action prior to the divine decision itself.

Ockham, for his part, radicalizes Scotus’s position. The distinction between *potentia absoluta* and *potentia ordinata*, derived from legal language, does not indicate two distinct powers in God but only two *modi loquendi* about the same object: divine omnipotence. While for Duns Scotus, God’s power has a limit, and this is the principle of noncontradiction, for Ockham the *potentia absoluta Dei* is bound by no principle or rational order. It follows that all things are contingent: God might have created them differently from how they are, or He might not have created them at all, and He may change them at any time – and this is what happens in the case of miracles. This position, which draws inspiration from an Augustinian background, would lead Ockham to deny any natural moral law, which depends rather on the free creative will of God only, as well as any rigid causal

determination of Aristotelian provenance. By denying the assumption that there are necessary links between contingent things, Ockham establishes the premises for the overcoming of Aristotelian physics, eventually leading to the development of the new Copernican scientific paradigm (Grant 1996).

Ockhamism had a great influence through the seventeenth century. Two of its fundamental theological theses, defended in various ways, would be the strong limitation of the reason's cognitive ability when faced with the questions of the existence of God and the immortality of the soul and the development of a conception of the divine will which is so absolute that it verges on arbitrariness, with repercussions in the area of justification and grace. In this connection, one may think of the positions of Gabriel Biel, Martin Luther's master (Hägglund 1955; Oberman 1987; Murphy 1979; Crucius 1989). The relationship between divine omnipotence and human freedom would be a central issue throughout the Renaissance, not only within the currents of Ockhamism but also in the humanistic theology that placed itself in open controversy with the special jargon of the schools (see *Will, Free*). From this point of view, it can be seen how Nominalism anticipates the "human anxiety in the face of the world" (Blumenberg 1974, 175) that would be a distinctive trait of Renaissance thought.

During the early Renaissance, Ockham's positions about language – that is, the analysis of a term's meaning through its properties (*virtus sermonis*) – and about *potentia absoluta Dei*, as well as the same *distinctio formalis* proposed by Duns Scotus, would progressively tend to develop autonomously, giving rise to a hypothetical theology that is attentive to the distinctions and to the formal aspect of theological argumentation (Dettloff 1954). A deep discomfort about this theological formalism was felt both inside the theological faculties (Piana 1977) and outside them, by the "humanists" (so-called in order to distinguish them from those occupied with the *studia divinitatis* and the other disciplines proper to the *scholae*, namely, Law and Medicine). This aversion to the intellectuals outside the university toward the abstract formalism of the scholastic

"*quaestiunculae*" and "*disceptatiuncule*" dates back, on closer inspection, to the time of Petrarch (1304–1374). It should also be said that the humanists' aversion is often directed more toward degenerations of the scholastic method than toward scholasticism itself. Think, for example, of the *Encomium sancti Thomae Aquinatis* by Lorenzo Valla (Mesnard 1955) or of Erasmus's harsh criticisms of the Nominalists and Scotists, who had reduced a doctrine worthy of being taught with seriousness to *vaniloquium* (Margolin 1979). The *novatores*' demand would be, instead, to find new answers to the traditional theological problems, in order to translate theological knowledge into a language more appropriate to the emerging bourgeois mercantile and financial class, for which the schools' theological elaboration was too technical and distant from life.

Protestant Reform and Second Scholasticism

In the province of school theology, starting from the fifteenth century, one sees a revival of scholasticism, which was able to take up once again the themes most dear to the medieval masters without betraying the achievements of humanistic culture, namely, the centrality of the subject, the attention to the sources, and the revaluation of contingency and history. In this regard, as E. Lewalter has said, "Humanism enters the schools, becomes 'scholastic,' or – what is the same thing – the tradition of the schools (scholasticism) becomes humanist" (Lewalter 1935). Along with the humanistic renewal, the second decisive factor contributing to the revival of scholasticism was the historical and political crisis of Catholic universalism.

The exhortation to unity in the Church is in fact one of the constantly recurring themes of the time, as already testified in Petrarch's letter to Pope Urban VI, dated 1366, wishing for a return of the Holy See to Rome (*Epistolae Variae*, 3). The effort – ultimately vain – of restoring unity between Eastern and Western Churches would be the dominant theme of theological debates taking place around the Councils of Constance (1414–1418), Basel (1431), and Ferrara-Firenze (1438–1449) and until the summoning of the Fifth Lateran Council (1512–1517). Only a few months

after the closing of this Council, on 31 October 1517, the Augustinian monk Martin Luther makes public his 95 theses centering on the issue of indulgences, unleashing a debate (with implications on the political and financial planes) that would give rise to the Protestant Reformation. It is a dramatic event, marking a turning point in European culture and in theological debate.

Luther studied theology under the auspices of late-scholastic Ockhamism (Dieter 2001), but after taking over the chair of biblical exegesis at Wittenberg (1512), he placed himself in sharp disagreement with the metaphysically Pelagian way of thinking about the relationship between God and man. Against the scholastic's *theologia gloriae*, which wanted to understand the glory of God from the horizon of being and creation, Luther builds his own *theologia crucis*, founded on the Augustinian antagonism between sin and justice. Justification cannot be made either by the law – as already in St. Paul – or by works. This is the premise of what would become the real point of doctrinal rupture with Latin theology: justification by grace through faith (*sola fide, sola gratia, sola Scriptura, solus Christus crucifixus, soli Deo gloria*). If human nature is so corrupt as to be unable to make itself worthy of grace by its natural powers, reason would be likewise incapable of knowing God. Luther believes the radicalization of the fracture between reason and faith to be necessary in order to restore absolute primacy to faith in revelation. The need to bring the Church back to the essence of the evangelical faith (*sola Scriptura*) would lead him to reject the Catholic system of ontological and sacramental mediation and affirm the subjective immediacy of the relationship between the believer and God.

To this crisis, Roman theology reacts by reaffirming the primacy of tradition and the magisterium for a correct interpretation of the Bible (apologetical and controversistic theology) and further reasserts the congruence of revealed faith with natural reason (the *praeambula fidei*) (Buzzi 2000). According to the Aristotelian-Thomist canon. It should also be noted that in the debates within the Protestant milieu – already beginning with Melanchthon, in the wake of Erasmus – a more conciliatory tendency would develop with respect

to the relationship between Christianity's reasonableness and rational analysis (Melanchthon, *De loci communes rerum theologicarum*, 1521; *De dialectica*, 1528; *Erotemata dialectices*, 1547); it would lead to a recovery of scholasticism in the reformed context as well. With the reform of studies undertaken by Melanchthon, indeed, the form of disputation comes to be standard in almost all reformed universities (Paulsen 1919).

At the time of the Council of Trent (1545–1563) and afterward, there is, therefore, a theological return to the medieval scholasticism of the twelfth century. This development is given the name “second scholasticism”; it should be kept in mind that it runs parallel to the other trends of thought mentioned above (the revivals of Platonism, Augustinianism, and Averroism or Alexandrian Aristotelianism). Catholic second scholasticism rises in Spain. It had been anticipated by Dominican scholasticism, but it finds renewed impulse among the representatives of the Society of Jesus (Jesuits), founded by Ignatius of Loyola in 1534, and spreads swiftly to Germany and Central and Northern Europe as well as the wider world (Africa, India, Japan, China, Brazil, Peru, Paraguay, Canada). This new trend in the philosophy of the schools, therefore, enters not only into Spanish, Portuguese, and Italian Catholic institutions (Alcalà, Coimbra, and Padua) but also into those in Belgium (Leuven) and the large universities dominated by the Reform (Altdorf, Basel, Heidelberg, Leipzig, and, in Holland, Leida, and Haarlem) – giving rise in the latter to an interesting academic exchange between Lutheran and Calvinist philosophers and Aristotelianism of Catholic and Jesuit provenance (Eschweiler 1928).

A good example of the two tendencies of post-Tridentine theological scholasticism is the controversy that arose between Spanish Dominicans and Jesuits about the problem of the foundation of theology as a science. The controversy began with Melchior Cano (1509–1560). While fully aware of the Counter-Reformist orientation advocated by the Council of Trent, which he attended, he disputes the possibility of founding theology on the data of natural reason. In his *De loci theologici* Cano, indeed, reverses the order of

priority between philosophical *praeambula* and theological assumptions, denying any pretension of being able to find theology on rational arguments. Theological argumentation should instead start from the data revealed and transmitted by tradition and the magisterium of the Church (which represent the first eight of ten *loci theologici* he defined), in order later to add philosophical questions having to do with natural reason and history. If on one hand, Cano wants to emphasize the autonomy of theological reason with respect to the philosophical, by the same token, he risks presenting the data of revelation without regard to natural reason – exactly as Luther himself sought to do. It is precisely to overcome such a consequence that Jesuit scholasticism attempts to establish, in various guises, a renewed synthesis between metaphysics and revealed theology in order to uphold the continuity between the natural order and the theological order (or the order of grace). For instance, according to Benito Pereira (1535–1610), as well as Pedro de Fonseca (1528–1599), the texts of Aristotle remain the philosophical manual for students of theology. But, above all, the *Disputationes Metaphysicae* by Francisco Suarez (1548–1617) – designed as a propaedeutical course in philosophy for his theology students – represents a truly complete refiguring of the relationship between metaphysics and theology.

One of the great elements of novelty which would make this Spanish theologian the initiator of the modern form of metaphysical thought (Esposito 1995; Hoenen 1998) is his resumption and reinterpretation of Scotus's univocity of being (Honnefelder 1990), with which he distances himself from Thomas's conception of being as absolute perfection and act. Suarez argues instead for a *conceptus simplicissimus* of being, namely, a general concept of being (*ens in quantum ens*) that includes both infinite being (God) and finite being (the totality of entities), each according to its own order (*ordinate*). This decision radically redefines the relations between metaphysics and theology: from the doctrinal point of view, revealed theology is the point from which the philosophical search starts and to which it is directed; from the methodological point of view,

it is metaphysics that establishes the ontological order within theology.

In response to Luther's distrust about the possibility of reaching God through the created order, Suarez thus identifies in the concept of *ens* (as true *transcendens*) the key that allows him to translate the truth of revelation into an ontological language in such a way that revelation coincides with the very order of nature. This, so to speak, "neutral" character of Suarez's ontology – engaged with nothing but the purest essential constitution of being – will make it fruitful far beyond the Catholic milieu (Grabmann 1926; Freedman 1984; Esposito 2007). The *Disputationes* in fact became not only a theology manual for Jesuit students but also one of the most used manuals in Protestantism, which found in it a neutral or indifferent conception of being more compatible than that of Thomism with the native theology (Courtine 1990; Lamanna 2011, 2012).

Innovative and Original Aspects

Renaissance theology is characterized by a profound demand for *renovatio*, affecting the theology of the schools, the movements of spiritual renewal (*devotio moderna* and *Frömmigkeitstheologie*), the new Platonic theology, the philological hermeneutics of Sacred Scriptures, the Protestant Reformation, and the Roman Church's reaction to it.

What is characteristic of the *renovatio theologica* in each of these realms is the meaning given, time and time again, to the "return *ad fontes*," namely, the recuperation of a perfect past whose rebirth is somehow sought in the present. The guiding inspiration for this rebirth changes from occasion to occasion: Plato and the Neoplatonists; the pagan classics; a new way of interpreting Aristotle or the masters of medieval scholasticism (Thomas, Scotus, Ockham); original documents (including the Bible); the Fathers of the Church; or the evangelical radicalism of early Christians.

Alongside the problem of the relationship between divine freedom and omnipotence, which has already been discussed, the following

are examples of the most innovative aspects of theological discussion outside the schools: the concept of a *prisca theologia*, the problem of the immortality of the soul, and the philological criticism of the Bible and ancient documents. Not a few of these novelties from outside the academic environment would also affect in various ways the speculations of professional theologians.

Platonic Theology and *Prisca Theologia*

To those who have thought of the Renaissance as an era of the liberation of reason from its theological dependencies, it may perhaps seem paradoxical that at its beginning there is the fascination exerted by the myths of an ancient Eastern mystery religion (Toussaint 2003). In fact, one of the distinctive elements of Renaissance humanist culture is the search for ancient wisdom with the help of which it was held to be possible for people to come into a direct relationship with the divinity (Hankins 1990). This tendency is in part reinforced by the rebirth of Platonism, which profoundly marks the whole spiritual climate of philosophy and, more generally, of European culture itself (Vasoli 1995b).

Plato's entry into Renaissance philosophy has to be attributed first of all to the material arrival of the Platonic writings, previously unknown in the West (except for the *Meno*, the *Phaedo*, and the *Timaeus*), with the Byzantine experts who came to Europe with the Patriarch of Constantinople John VII Palaeologus on the occasion of the Ecumenical Council of Ferrara and Florence proclaimed by Pope Eugene IV (1438–1439). It stems, secondly, from the birth of the Platonic Academy in Florence, an extremely important center of studies, translations, and relationships brought about by Cosimo de' Medici (1462) and strongly influenced by the contribution of Marsilio Ficino (1433–1499).

Therefore, who is rediscovered in fifteenth-century Florence is not the Plato of the fourth-century B.C. Athenian Academy but the Plato studied in Byzantium and already strongly characterized by Neoplatonic interpretations like those of Plotinus, Iamblichus, and Proclus. Interestingly, this reception of Plato, mediated by the Byzantines, once inside the Renaissance

academies, assumes a completely different profile and scope. A prime example is the historical reconstruction of Platonic thought made by Ficino, to whom we owe, among other things, the first complete Latin translation of the works of Plato (as well as translations of the works of many Neoplatonists, including Plotinus).

In his reconstruction of the development of this ancient human-divine wisdom (*Plotini Epitomae, Proemium*), Ficino almost totally neglects to mention the contribution of Byzantine philosophy. He identifies its birth, by divine revelation, in ancient Egypt. It then goes through Pythagoras and Plato to Christ and, thanks to the mediation of the Neoplatonic philosophers, comes to the Fathers of the Church and to Dionysius, and from these, it reaches the representatives of its fifteenth-century rebirth. The reconstruction provided by Ficino, who showed himself well aware of being the heir and protagonist of this wisdom, provides a good example of what philosophy was meant to be in this age: a divine wisdom underlying the entire history of thought and bringing philosophy and religion together (*prisca theologia*). In fact, to Ficino the origin of philosophy is an illumination of the human mind by a real divine revelation that has shone the light of a single truth throughout the world, although along paths that are often hidden and in need of unveiling. That truth is the presupposition and the unitary summit of both philosophical and religious wisdom (Garin 1947).

And that is why Ficino, to describe such wisdom, adopts the terms "*docta religio*" (learned religion) and "*pia philosophia*" (pious philosophy): his ambition, in the wake of Plato, is to bring these to fulfillment. He speaks of the possibility of reestablishing an agreement between the *via philosophica* and the *via sacerdotia* to the truth (as he writes in a letter to Martino Uranio in 1489), both based on a single *sapientia* or on the supreme value of *amor* and *charitas* (Beierwaltes 1978).

This work of restoration of Platonism, understood as *praeparatio evangelica*, culminates with his *Theologia platonica de immortalitate animorum* published in 1482. In this work, he harmonizes the doctrines of Plato, Plotinus, and Proclus, as well as of the *Corpus hermeticum*,

with doctrines derived from Aristotle, Thomas, and Bonaventure. The result is an ontological-metaphysical structure of reality subdivided into degrees, where a central role is played by the human soul with its spiritual and cognitive vicissitudes.

The universal concord between Platonic and Christian wisdom is also the dominant note in the reflections of Giovanni Pico della Mirandola (1463–1494). Familiar with both Arabic and scholastic Aristotelianism and a reader of Proclus and Iamblichus (in Ficino's translations) as well as the works of the Fathers of the Church, Pico would appropriate the interpretative method of Jewish mysticism (the Cabala), with the intent of demonstrating the convergence between the revelation contained in Sacred Scriptures and in Pythagorean and Neoplatonist wisdom in his *Conclusiones philosophicae, cabalisticae et theologicae* (1486).

The myth of *prisca theologia*, born outside the theological faculties, would affect in various ways bold theologians such as Giordano Bruno (1548–1600) – who reprises with great originality terms derived from different traditions in order to show the original unity and infinity of everything – as much as it would affect the work of stricter apologists for Catholic doctrine who were committed to countering the Protestant Reformation. Think, for example, of the idea of *perennis philosophia* promoted by the Augustinian Agostino Steuco (1542), who was concerned to show how the theological positions newly contested by the Reformation were really an inheritance of ancient wisdom that arrived at its full completion with Catholic teaching. Traces of a universal concordism among Neoplatonic-Stoic wisdom, Judaism, and Christianity are also present in the work of the Franciscan Francesco Zorzi (1466–1540), the Augustinian Egidio Canisio da Viterbo (1469–1532), and the regular canon Agostino Steuco (ca. 1497–1548) and would inspire the *De vera philosophia* of Cardinal Adriano Castellesi (1507).

The Immortality of the Soul

The theme of the soul, so central in Platonic theology, provides an interesting vehicle for capturing many new aspects, not only of the

Renaissance theology that refers back to Aristotelianism but also of the *Frömmigkeitstheologie* (Hamm 1982) that develops outside the schools (in the *devotio moderna*, in the phenomenon of mysticism, in Catholic figurative art).

A lively debate about the immortality of the soul arises between the fourteenth and fifteenth centuries. Factors of both historical and cultural kinds contribute to its rise. Among the historical events that came together to reignite the eschatological demand, one must remember both the Black Plague (1347–1353), with its subsequent epidemic waves all over Europe, and the crisis of medieval monarchies, which had created a state of general *insecuritas*. A trace of this can be found, for example, in the sermons of many preachers of the fifteenth century (Girolamo Savonarola, Giacomo della Marca, Bernardino de' Busti, Michele Carcano, Gabriele Barletta), who reserved a great deal of space for the problem of death and the destiny of the soul. The two cultural factors that contributed to fueling the discussion were the discovery, on the one hand, of Platonism and Neoplatonism and, on the other hand, of the ancient Greek commentators on Aristotle, in particular Alexander of Aphrodisias. The arrival of these traditions increased the number of possible philosophical solutions to the problem of the immortality of the soul: Neoplatonists in the area of Florence, headed by Marsilio Ficino, maintained the immortality of the soul and its superiority over the body, considering it to be a middle term in the conjunction between the intelligible and sensible worlds (*copula mundi*). Alexandrists – those who related their thinking to Alexander of Aphrodisias – affirmed the mortality of human soul and that only the *intellectus agens* (God) was immortal. Averroists – who defended instead the Aristotelian commentary developed by Averroes – claimed that there were two separate and immortal intellects, the possible intellect and the agent intellect, which all humans shared (Sgarbi 2014). The main place of confrontation between the positions of Alexandrists and Averroists was the University of Padua (Kristeller 1990).

A testimony of the importance of this debate, in which interpretations contrary to Catholic

teaching on the immortality of the individual soul were espoused, is the edict of 4 May 1489, issued by Pietro Barozzi, Bishop of Padua, with the help of the commission of the theologians he established (Martino da Lendinara and Antonio Trombetta), in which it was forbidden to hold public disputes (*publice disputare*) about the immortality of the soul.

Despite this ban, Averroism would continue to have in Padua its avowed followers: Marcantonio Zimara (ca. 1470–1537), Tiberio Bacilieri, Pietro Trampolin (1451–1506), and Agostino Nifo (ca. 1473–ca. 1546). The fact that this interdict failed to prevent the professors of Padua University itself from continuing to teach Averroist doctrines in schools (Nardi 1958), and that Platonic theses continued to circulate in universities outside the diocese of Padua, is demonstrated by the fact that years later the Roman Curia, with the seal of Pope Leo X, issued the bull *Apostolici regiminis sollicitudo* (19 December 1513). In this papal document, the Catholic doctrine of the individual immortality of the soul was reaffirmed, and the theses of those who claimed the identity of the human intellect for the entire species, the mortality of the individual soul, and the eternity of the world were condemned. The philosophers are then urged to clarify their doctrines according to the truth of the Catholic magisterium and, as far as possible, to try to show the agreement of the latter with philosophy. As has been observed (Grendler 2002), this last assertion reveals that not all members of the theological commission appointed to write up the bull considered it possible to demonstrate philosophically all the truths believed by faith – particularly the immortality of the soul. This is attested by the presence of the commission of the Dominican Tommaso de Vio, who in both his commentary on Aristotle's *De anima* (1510) and in his *Parabolae Salomonis* (1542) asserts the philosophical indemonstrability of the immortality of the soul.

The same thesis was strongly supported by Pietro Pomponazzi in his *De immortalitate animae* (1516). Pomponazzi states that the interpretation of Aristotle given by Thomas cannot be maintained, since for the Stagirite the intellectual soul always needs the body and therefore is, like

the body, essentially mortal. The publication of this text aroused sharp controversy. The first to rebut the position of Pomponazzi was his former disciple Gasparo Contarini (1483–1542), a Venetian patrician, later destined to become the greatest personality of the Catholic reform movement (Sgarbi 2004; D'Onofrio 1995, 445sqq.). Pomponazzi would answer with an *Apologia* (1518) presenting his answers to Contarini and other opponents (Ambrogio Fiandino and Vincenzo Colzade). The controversy would begin again after the *De immortalitatae animae libellus adversus Petrum Pomponacium* (1518) by Nifo (Blum 2007).

The fact that the destiny of the soul was a crucial theme for Renaissance theology is also clear from its persistence in Catholic figurative art (Panofsky 1962). In fact, what is accomplished by, to give only one example, Michelangelo Buonarroti in the *Giudizio universale* (1536–1541) is a “theology in pictures,” influenced by the preaching of Giles of Viterbo (1469–1532) and guided by a precise iconographic program previously elaborated in the theology of Sixtus IV. Thus papal patronage early on, and Counter-Reformation preaching later, attempted to make the pattern of the Catholic doctrine of immortality available to the widest possible audience. During and after the Council of Trent, this led to a pictorial translation of the official doctrine. Cardinal Federico Borromeo (1538–1584), author of an important treatise on sacred architecture, and Cardinal Gabriele Paleotti were crucial figures in the politics of the image in this era (Verdon and Hendersson 1990).

The problem of the soul returns to the forefront in the famous controversy of Valladolid (1550–1551), which featured the opposing positions of the Dominican Bartolomé de Las Casas (1484–1566) and of the jurist Juan Ginés de Sepúlveda (1490–1573). The object of the dispute – commissioned by Charles V in order to legitimize himself in the face of the denunciation of abuses committed by the Spaniards toward the Native Americans – was to discuss the legal and spiritual nature of the indigenous people. The controversy about the presence of the soul and therefore about the natural rights of the Native

Americans, which remained unresolved in Valladolid, had already received a definition in the papal bull *Sublimis Deus* (1537), by which Paul III recognized the indigenous, as creatures of God and rational beings, the rights to property and to freedom. Only with Philip II, 20 years after the controversy, would the wars of conquest end and a process of pacification with the New World populations begin.

Soul is the protagonist of two other phenomena important for the theology developed outside the universities: that of the *devotio moderna* (fourteenth to fifteenth centuries through the seventeenth century's *Frömmigkeitstheologie*) and that of mysticism (XIV–XVI). It is crucial that the care of the soul leads both these spiritual movements to amply value the body as well as, for example, in the “spiritual senses.” Catholic scholastic theology – which is a discourse (Logos) – “in fact lacked a body” (de Certeau 1982). There was, of course, the system of sacramental signs, which gave laymen access to a symbolic experience of mystery. Yet it was also heavily burdened by an apparatus of legal norms and directed by priestly mediation in an exclusive way. Secondly, ecclesiastical theology was the province of male religious orders. In spite of the substantial differences between *devotio moderna* and mysticism, each involves a renewal of theology in which women and the laity also become protagonists, and centrality is attributed to bodily immediacy. Among the mystics, that immediacy comes about through experiments with new expressive and symbolic languages in which visions, transverberations, and ecstasies are narrated; in the case of the *Devotio moderna* (which would be one of the preconditions of the Protestant Reformation; Kaufmann 2016; Lourdaux 1972; Stupperich 1967) through a direct reading of the Gospel, a valorization of sentiment and a concrete experience of charity (*imitatio Christi*) lived in the light of an imminent eschatology (*praeparatio ad mortem*).

Philological Criticism and Theology

With the renewal of the *studia humanitatis*, and therefore of the *trivium*, and with the increasing importance attributed to the value of philological

criticism in understanding and translating classical texts, the approach to Sacred Scripture and patristic sources undergoes a significant change, throwing new light on their original meaning (Lorenzo Valla, Lefèvre d'Étaples, Erasmus). Against the technicality and the proliferation of meanings assumed by theological hermeneutics, the humanists looked for a single literal meaning capable of unifying the entire discourse.

Lorenzo Valla stood at the origin of a demand for returning to the original biblical text that would animate Erasmus – according to whom “theology without philology is not possible” – as much as it animated the vernacular translations of the Bible undertaken by the Frenchman Lefèvre d'Étaples and, on its basis, by the German Martin Luther. Valla was also the initiator of modern historical criticism.

The project of biblical humanism was essentially accomplished in two moments (Bedouelle 1989): at the beginning, the humanists worked to make glosses and philological improvements to the text, correcting single expressions or words, and even discovering misunderstandings in Jerome's Latin translation, the *Vulgata*. In this direction lies Valla's *Collatio Novi Testamenti* (Valla 1970 [1442–1443]); its second improved version was edited by Erasmus in 1505 (*Adnotationes in Novum Testamentum*).

In a second phase, however, the original sense of the text was reestablished in the light of a translation of the sources from their original language. Here the humanists did not limit themselves to reestablishing the original version of Scripture but took care to recover the interpretation given to it by the Fathers. Indeed, if in the theology of the Middle Ages classical and patristic *auctoritates* were cited in a way that was directed toward the organization of the *quaestiones*, in the Renaissance, ancient sources instead represented indications of an alternative way of thinking (Buck 1968). It is therefore understandable why, in the Renaissance, there began a large wave of publications of the works of the Fathers, especially in Paris and Basel.

The critical and philological methods promoted by humanism produced at least two results. On the one hand, it served to awaken the interest

of official theology in biblical sources and refocused attention on the importance of translations and therefore on the need to study the original languages. Consider, for example, the Trinitarian debate between Catholic and Orthodox theologians which was a central issue of the Council of Ferrara-Florence (1438–1439) concerning the historical and terminological questions related to the doctrine of the *Filioque* (Vasoli 1995a). Or consider the foundation of various colleges for teaching and learning ancient languages (like the Trilingual College of San Ildefonso de Alcalá founded in 1502 by Cardinal Ximenes de Cisneros, who created the famous *Poliglotta Complutense*, or the College of the Young Greeks commissioned by Papa Leo X in Rome), which eventually would lead to the establishment of instruction in Sacred Scripture in the process of clergy formation that the Council of Trent sanctioned. Finally, think of the creation of several critical editions of the Old and New Testaments, such as the *Vulgata Clementina* of 1592 and the *Settanta* of 1578.

On the other hand, the philological method and its associated historical criticism greatly contributed to increasing skepticism about the claim to the truthfulness of certain pillars of the Catholic religious edifice of the time. That happened, for example, when Valla demonstrated that the famous *Donatio constantini* – according to which Constantine I was said to have endowed Pope Silvester I and his successors with primacy not only over the patriarchates of the Orient but even over the Emperor himself – was a forgery (Valla 1922 [1517]).

The emergence of skepticism concerning the actual value of religious assumptions is therefore in some respects a natural outcome of the critical maturation of the historical and philological methods, which would receive a new stimulus after the publication of the cosmological theses of a canon of the diocese of Warmia, Nicholas Copernicus. When in 1543 the six books of *De Revolutionibus orbium coelestium* appeared, there were no direct oppositions from the Roman Curia. With the nomination of the Dominican Gianmaria Tolosani (1470–1549) as Master of the Sacred Palace, some allegations

directed against the Copernican theory began to appear, since it “contradicted the principles of Sacred Scripture” (*De coelo et elementis*, 1549). Years later, in 1615, another Dominican, Tommaso Caccini, would go to Rome to denounce the Copernicanism of Galileo Galilei. Galileo’s scientific discoveries required revision not only of the canons of Aristotelian cosmology but also of the scope ceded to biblical interpretation. Beyond the events of Galileo’s own biography (e.g., his repudiation of Copernicanism on 22 June 1633), the “Galilean affair” brings to center stage an interpretive question about the distinction between the language of nature (mathematics) and the language of faith (history) which would continue to animate the debate over the subsequent centuries.

Impact and Legacy

The Renaissance is an age in which theology is challenged on several fronts to redefine its position with respect to other disciplines: philosophy, textual criticism, and natural science. The confrontation between each of these areas and theological discourse bears fruits not yet mentioned (1). It is also true that these same disciplines, though in themselves autonomous with respect to theological themes, more and more come to define their own “modern” status in an essential confrontation with developments arising within theology itself (2).

(1). 1.1 One of the versions of Christian Neoplatonism that will have particular influence through the seventeenth century is that of Augustine, who was already a crucial author for Petrarch. Augustinian gnoseological themes return, in fact, not only in Blaise Pascal (Wills 2012) but also in Cartesianism, especially in Nicolas Malebranche doctrine of ideas (Gori 2007). Augustine’s dialectic of sin and grace – which runs through the entire Renaissance, from Luther to the famous controversy *de auxiliis* between Jesuits and Dominicans – would continue in German Pietism and Jansenism. The latter, initially developed in Belgium and the Netherlands, had its core in the Cistercian Abbey of Port-Royal of Paris, where

Blaise Pascal (†1623) and Antoine Arnauld (†1694) – brother of Mère Angélique, the monastery's abbess (Sainte-Beuve 1871) – worked. Traces of a universal concordism in religious matters, peculiar to Renaissance Platonism, can be found in Pascal, who founds his Christian apologetics more on the hope of truth than on the presumption of acquiring irrefutable certainty. And those traces appear even more clearly in the “rational religion” proposed by Cambridge Platonism, whose religious and philosophical syncretism has its explicit sources in the Augustinian tradition and in the resumption of Renaissance Neoplatonic themes.

1.2 The philological attention to the New Testament inaugurated by Lorenzo Valla and Erasmus would encourage many editions of the Bible between the fifteenth and seventeenth centuries. Particularly worth mentioning are the works of Johann Jakob Wettstein (1693–1754), who begins modern textual criticism with his New Testament edition in 1751–1754, followed by those of Johann Jakob Griesbach (1745–1812), Karl Lachmann (1793–1851), Constantin von Tischendorf (1815–1874), and his disciple Gaspar René Gregory (1846–1917). The pioneer of the textual criticism of the Old Testament, on the other hand, was Luigi Cappel (1585–1658), followed by Benjamin Kennicott (1718–1783) and Giovanni Battista de Rossi (1742–1831). These works lay the foundations for the eighteenth- and nineteenth-century development of the historical-critical exegetical method.

(2) The most significant results of Renaissance theology for subsequent thought are its impact on the codification of modern empiricism and on the canonization of modern ontology.

2.1 Modern empiricism, rightly regarded, has its characteristic theoretical presupposition in that “radical empiricism” (Grant 1996) which is at the root of the Ockhamist teaching on the *potentia absoluta Dei*. The knowledge possessed by humans living in a contingent world governed only by divine will is not founded on abstract universal ideas (*species intelligibiles*) but on a sensible experience (through the *cognitio intuitiva*). This epistemology establishes the premises for the development of Copernicanism and of a

conception of physics different from any philosophy of nature of an Aristotelian stamp. Think, for example, of Hume's empiricism or of modern mechanism, in which the universe is seen as a clock set in motion by a watchmaker-God who, once the initial start-up work is completed, remains completely indifferent to the subsequent operation of the mechanism that he has started (Randi 1987).

2.2. Jesuit scholasticism, born as a conceptual tool of the Catholic Reformation, was the model for the elaboration of Reformed and Lutheran *Schulmetaphysik* (Werner 1861, 1887; Paulsen 1896; Wundt 1939; Leinsle 1985, 1988; Courtine 1990; Kuhn 2002) and thus the presupposition for the birth of modern ontology (Lohr 1988). Suarez's *Disputationes* played a prominent role in this connection. With the Scotist resort to the concept of *ens* as true *transcendens*, Suarez overcomes the division between general and special metaphysics. Unlike Thomas, whose notion of *ens* constitutes only a part of metaphysical discourse, which is in itself governed by the concept of cause, Suarez, in the wake of Duns Scotus (Honnefelder 1990), assumes the *ens in quantum ens* as the adequate object of the entire science of metaphysics, under which fall the other special sciences and theology as well. In this way, the *Disputationes* represent one of the clearest points of passage from the classic to the modern meaning of the term “transcendental” (Esposito 2007).

Theophanes of Medeia

Born: Constantinople, 1400

Died: Constantinople, 1474

Michail Mantzanas

Ecclesiastical Academy of Athens, Athens, Greece

Abstract

He was born Theodore Agallianos. He was appointed official of the Eastern Orthodox Patriarchate. He was the author of seminal theological works. The value of his letters is priceless, as they shed light on the historical events pertaining to the period of the fall of Constantinople. Theophanes of Medeia condemned the scheming of church officials, while, as far as the compliance with church rules is concerned, he emphasized the principle of the distinction between needs and historical conditions.

Synonyms

[Agallianos, Theodore](#)

Biography

Theophanes of Medeia was a Metropolitan of Medeia, a renowned scholar, and a writer. He was born in Constantinople around 1400 and died before 1474. He was a disciple of the Metropolitan of Ephesus Marc Eugenikos, as well as a close friend of the Patriarch of Constantinople Georgios Gennadios-Scholarios. He originally assumed the office of deacon (1425) and hieromonachos (twice from 1437 to 1440 and from 1443 to 1454). Lastly, during Gennadios' patriarchal office, he was appointed grand chartophylax (1454) and grand oikonomos (1466). He was forced to relinquish these positions because he disagreed with the Patriarch. Meanwhile, he changed his name to Theophanes

when he was ordained a Metropolitan of Medeia in Thrace in 1467. There have been no testimonies preserved on his actions at the seat of the Archbishopric, probably because he had never been there.

Innovative and Original Aspects

His writings mirror a person with deep philosophical and theological expertise, as well as a bright, literate man, outspoken with commendable force and critical thinking. In his most influential work entitled *On Soul (Peri psyches)*, Theophanes exploits the methodological and conceptual richness of Greek philosophy in a creative way, so as to present the ontological aspects of the soul, according to the Orthodox Church. His work, which was highly praised by the Patriarch, was published in Leipzig in 1784 in a joint volume together with Nikiforos Blemmydes' *Logic*. Theophanes' treatise *On Providence (Peri pronoiias)* was written in the form of a dialogue. The initiator posed the questions and the mystic, who was Theophanes' alter ego, responded. Although in several parts of the specific work he admittedly incorporated direct quotes from the respective writings of Gennadios and Marc Eugenikos, he did not hesitate to criticize and argue against the views developed by the latter in his *On living conditions*. The two apologetic *Logoi*, published in 1463, as well as his correspondence with eminent men of his time – among others the prominent scholar George Amiroutzes, who commented on the edition of *On Providence* – are not only living proof of the turbulent and complicated situation of the Eastern Church, which was contested by both the intrigues of ecclesiastical officials and the schemes of Ottomanism; they also reflect Theophanes' broad-mindedness and independent spirit, as he expressed the view that the Church should not adopt a rigid and dogmatic approach to issues related to the administration of the Church (the reason for his disagreement with Gennadios) or issues that do not affect the core of religious faith, suggesting that the Church should be

more flexible in resolving emerging problematic matters, taking into consideration historical circumstances. Theophanes did not abandon Constantinople even when it was conquered by the Ottomans. He was imprisoned and was released a year later after the fall to witness the suffering and the atrocities the people of Constantinople suffered from the Turks. He shared this testimony in his *Chronicon simeioma peri ton ipo ton Tourkon epenecthenton kakon*.

His writings also include the following treatises: (a) *Against the Jews (Kata Ioudaion)*, as it was found with the code 6 of the Gymnasium of Mytilini, and (b) *Against the Latins (Kata Latinon)*, in which he manifests his strong opposition to the union of the two Churches and in fact braces the views of his teacher and Patriarch.

Impact and Legacy

Agallianos' works comprise 14 letters which are highly commendable, as they shed light on the turbulent period of the fall of Constantinople, and they reveal Theophanes' latitudinarianism and faith in the tradition of the Church.

Theophanes of Nicaea

George Zografidis

Department of Philosophy, School of Philosophy and Education, Aristotle University of Thessaloniki, Thessaloniki, Greece

Abstract

A Byzantine theologian of the fourteenth century (?–1380/1381), he is a leading figure of the Palamite party in the last phase of the Hesychast controversy and bishop of Nicaea. As an influential official of the Patriarchate of Constantinople, Theophanes was involved in important ecclesiastic affairs, and he undertook multiple tasks: (a) to refute anti-Palamite assumptions expressed by Prochorus Kydones; (b) to vindicate the Hesychast views of Gregory Palamas and Theophilus Kokkinos, i.e., for the distinction and yet inseparability between God's essence and energies and deification; and (c) to defend Eastern Orthodoxy against pro-Latin views of certain Byzantines (such as Demetrius Kydones), especially on the issue of *Filioque*. He is considered the first Orthodox thinker influenced by Thomas Aquinas. In his writings, he adapts certain ideas of the great Latin theologian whose major *summae* had been translated into Byzantine Greek.

Biography

Very little is known about Theophanes' life and studies. He was a member of the intellectual circle around Emperor John VI Kantakouzenos (c. 1292–1383) and perhaps a disciple of Philotheos Kokkinos (the pro-Palamite Patriarch of Constantinople, c. 1297–1379). Both officials

entrusted him with missions to resolve urgent ecclesiastical and state problems. Theophanes was elected Metropolitan of Nicaea after 1364, but when the city was conquered by the Turks, he confined himself to sending pastoral letters to his flock, exhorting the enslaved Christians to be long-suffering (Polemis 1996, 25–30; Zacharopoulos 2003, 37–44).

Theophanes did not produce many works; of special philosophical interest are his *Discourses on the Light of Tabor* (1369–1371) and the *Refutation* (after 1365).

The *Discourses Against the Latins* (after 1368) form part of the longstanding and massive anti-Latin Byzantine literature. Theophanes develops his theology on the procession of the Holy Spirit, a highly controversial issue between the Greek and the Latin Church. He distinguishes two ways of discussing theological issues: (a) through the relevant passages from the Scripture and patristic writings or (b) if they are not available, by examining the topic on the basis of theological criteria approved by the Fathers.

In the *Discourses Against the Jews* (after 1371), Theophanes argues not only for the fulfillment of the Mosaic Law by the Gospel but mainly for the superiority of the latter. The views expressed in this lengthy work are typical for medieval Christian literature that sought to denigrate the Jews as not being real descendants of the Old Testament's people of God.

The *Sermon on the Virgin Mary* (c. 1370) is perhaps Theophanes' most important theological work, given the place of Mariology in Christian theology (Bertetto 1981; Makarov 2012). There, he adopts Maximus' formula that God has created the beings not only to exist but for their well-being.

In his writings, Theophanes displays a solid knowledge of classical and Christian literature. Due to his complicated style, the meaning of many sentences remains obscure. The polemic purpose of his works and their dialectic character make him present in extenso his opponents' arguments (from various, direct and indirect, sources).

Heritage and Rupture with the Tradition

Theophanes was involved in the last phase of the Hesychast controversy (Makarov 2013) when the Prochoros Kydones' affair dominated. The eminent anti-Hesychast denied that God can be divided into essence and (uncreated) energies and that human beings can participate in him. The nature of the Thaboric light was a central theme in the controversy. What was at stake was the possibility and the nature of humans' participation in God, i.e., deification. For anti-Hesychasts the light experienced by the monks was not divine but a created symbol of divinity. Gregory Palamas had already stressed that divine energies are not merely attributes of God (as Barlaam had claimed); the deifying light pertains to God's essence (it is essential) while not being itself the essence of God – in any case, it is not symbolic. So deification is more than a natural perfection; it is a transformation of human nature by divine action.

Theophanes, in a *Letter to [the Latin] Archbishop Paul*, defends Palamas' thesis that divine essence and energies differ from each other in reality (i.e., as real things) although they are separated only conceptually. He amplifies this argument in the *Discourses on the Light of Tabor* (1369–1371). Involved in the official case against Prochoros Theophanes, he constantly takes the opportunity to cite and refute many views of the anti-Palamite thinker.

According to Theophanes three ways are available for men to know God: (a) a kind of natural theology; (b) an experience of the divine light that occurs when the natural faculties (mind, sense) of the “worthy” men have been transformed by grace through illumination; and (c) the interpenetration of the two natures and deification, when all natural operations cease. The affinities between Theophanes and Aquinas on this subject are obvious, although Theophanes does not imply any comprehension of the divine reality. His treatment of interpenetration depends on Maximus, and, generally, the influence of earlier Greek Fathers (Ps.-Dionysius, Maximus, John of Damascus) cannot be underestimated (for his relation to Palamas: Louth 2005; van Rossum 2013).

The long title of his most philosophically interesting treatise is indicative of its scope:

Demonstration by certain arguments, supposed to be irrefutable, of the possibility that the beings could have been created ab aeterno – and its Rebuttal together with an examination of the deceit of these alleged irrefutable arguments. The influence of the scholastic method and the use of many formulations found in Aquinas's translated works are uncontested. In the treatise Theophanes enumerates nine arguments for the possibility of the creation of the world ab aeterno (§§1–9), replies to them (§§36–44), and formulates his own twenty-five arguments (§§10–35).

Given the anti-Latin stance of dominant intellectual circles in Constantinople, Theophanes refrains from making explicit references to Aquinas. The fact is that Theophanes and other anti-Latin Greeks were influenced (or at least impressed) by the subtle scholastic argumentation and the systematic juxtaposition of *pros* and *contras*. Through Kydones' translations, Theophanes became acquainted with Aquinas's thought. He derives arguments for the eternity of the world from *Summa contra Gentiles*, and many textual parallels between the two writers have been identified. This, however, does not necessarily entail that Theophanes was a *stricto sensu* Thomist as the issue of the influence of certain Latin doctrines is a more complex one. His moderate style despite the polemic character of his works and his use of Latin writings does not imply that he keeps equal distance from Palamites and pro-Latin anti-Palamites. He uses Aquinas's formulations in an eclectic manner as if many sentences of the Latin theologian do match the Orthodox faith (Toulis 2014 contra Polemis 1996, 122–125).

Thomism in Renaissance Philosophy

Efrem Jindráček

Department for the Study of Ancient and Medieval Thought, Institute of Philosophy, Czech Academy of Sciences, Prague, Czech Republic

Abstract

Thomism is a philosophical-theological movement or school essentially inspired by the thought of Thomas Aquinas (d. 1274), a Dominican master, traditionally called *Doctor Communis* or *Doctor Angelicus*. His doctrine is an original synthesis of Roman Catholic theology and a philosophical system based on Aristotelian, Neoplatonic, Roman, Arabic, and Jewish thought. Thomism in its original and authentic form distinguished very precisely between theological and philosophical knowledge or method. In philosophy, Thomism only used rational arguments, with the aim of providing, if possible, a universal philosophical interpretation of reality, neither relying on religious belief nor contradicting Christian Revelation or Catholic Doctrine (Kristeller 1974a, 843–844). With the development of a Thomist presence at the universities, especially in northern Italy, this school also received the designation of the *Via Thomae*, as opposed to the *Via Scoti*, a term reserved for those holding the teaching chair reserved for the Scotists (Tavuzzi 1992, 133; Kristeller 1974a, 855). Some key characteristics of Thomism’s development in the Renaissance were contact with Italian Aristotelianism, especially in its Averroist form; a highly evolved scholastic terminology; rigorous philosophical logic; polemics against the Albertist and Nominalist schools (influenced by Scotism), and later against Molinism (Luis de Molina d. 1600) and an alternative interpretation of Aquinas’s thought – especially the one proposed by Francisco Suárez (d. 1617). Typical works by Renaissance Thomists include the

Things of State

► Reason of State, Renaissance Concept of

commentaries on Aquinas's works and commentaries on the *Corpus Aristotelicum* in the form of questions, a new type of philosophical work – the *Compendium* and also the *Cursus* – and systematic expositions of all philosophical disciplines in the Aristotelian order and following Aquinas's interpretation. After 1492, with the Spanish colonization of the New World, Thomism made an important contribution to the development of international law and human rights, on the foundation of natural law.

Synonyms

Thomismus; Via Thomae

Heritage and Rupture with the Tradition

The term *Thomismus* emerged at the beginning of the fourteenth century as a derivation from Aquinas's name "Thomas." Originally, however, Thomas's disciples were called *Thomatistae* by their adversaries (Ehrle 1920, 491–494). For the birth of Thomistic philosophy, the following works were crucial: the writings of Aquinas himself; the philosophical heritage of the first and second generation of Thomists (ca. 1274–1300), a heritage founded on polemics with Scotist and Augustinian scholars and expressed in particular kinds of treatises such as the *Correctoria*, *Apologiae*, and *Concordantiae* (cf. Torrell 1997, 10–24; Robiglio 2008, 18–39); debates with the Nominalists or Terminists such as Durandus of Saint-Pourçain (d. 1334), Willam of Ockham (d. 1347), John Buridan (d. 1358), and the highly original French thinker Peter Aureolus (d. 1322).

The Early Thomist School

In addition to theoretical and doctrinal polemics, the 1323 canonization of Thomas Aquinas in Avignon by Pope John XXII constituted a strong apology for Thomas's orthodoxy against his critics (Robiglio 2008, 70–72). In the

canonization declaration, Aquinas was, among other things, formally presented as the best teacher of evangelical poverty (!), against contemporary radical spiritualist (Franciscan) movements. The history of Thomistic Philosophy in the first half of the fourteenth century was marked by the work of Hervaeus Natalis (d. 1323), Gratiadeus Aesculanus (ca. 1341), Armandus de Bellovisu (d. after 1340), and anonymous but very influential pseudo-Thomasian treatises such as the *Summa totius Logicae Aristotelis*, *De principio individuationis*, *De natura generis*, *De natura accidentis*, and the spurious opusculum *De fallaciis*. During this first historical period, Thomists formulated some typical philosophical doctrines which distinguished them from other philosophical schools: (1) the theory that act and potency are two different, contradictory principles which divide being, a theory which also entails the purely potential character of primary matter; (2) the analogical unity of the concept of being; (3) the unicity of substantial form as a constitutive act for every individual subject, and by consequence that the human soul is the only substantial form of the human being; (4) the individuation of physical bodies by determined matter, and by consequence the impossibility of a plurality of separated forms in any given species; (5) the real distinction between the faculties and the essence of the human soul; (6) the primacy of the intellect in human nature and its decisive role in achieving happiness; (7) the possibility of a rational demonstration of the existence of God; and (8) the noncontradictory nature of the non-temporal or eternal creation of the world. In this period, the theory of the real distinction in creatures between essence and existence was strongly defended by many Thomists, but not by all. The theory of analogy as such and the doctrine of God's knowledge of future contingents would be developed in a more precise way in the future.

Roughly during the second half of the fourteenth century, Thomism suffered an immense decline. The causes were diverse and both internal and external, including social, religious, and

philosophical factors. Among the more important of these were: (1) the Western Schism or Papal Schism which tempted to internally divide the Roman Catholic Church from 1378 until 1417; (2) the Black Death (1346–1353), one of the most devastating pandemics in human history; (3) the violent Hussite movement; and (4) religious movements such as the Beguines and Beghards, Rhineland mysticism, and the *Devotio Moderna*, all of which had a very different doctrinal anchor and enjoyed extensive spiritual and intellectual influence. The overall atmosphere was rendered more difficult by an immense skepticism, accompanied by nominalism and (paradoxically) an extreme realism, as well as the growth of radical religious movements with strong apocalyptic tendencies. These circumstances led to a weakening and dividing of important institutions such as universities, religious *studia*, and priories, the very institutions in which Thomism had set down its roots.

Innovative and Original Aspects

After the exclusion of Dominican masters from the University of Paris (from 1389 to 1403), provoked by the scandal of Juan de Monzón (d. 1412) with his violent polemic against the defenders of the Immaculate Conception between 1387 and 1389, Thomism again gathered strength and expanded in impressive fashion in France, Germany, Italy, and Spain. Although Thomism still retained the scholastic method, and perhaps it would be better to speak of “Thomism in the Renaissance” rather than “Renaissance Thomism” (cf. Tavuzzi 1992, 132–133), we cannot overlook certain characteristics that shaped this school, especially under the influence of the Italian philosophical setting.

France

Without a doubt, one of the most highly influential Thomists in this period was John Capreolus (d. 1444), a Dominican master in Paris, where he was certainly present from 1407 to 1411. From 1409 to 1432, he worked and taught in various cities (Paris, Toulouse, and Rodez) and wrote a

monumental work, the *Defensiones theologiae divi Thomae Aquinatis*. This comprehensive, detailed commentary on Peter Lombard’s *Sentences* includes critiques of Duns Scotus, Henry of Ghent, Peter Aureolus, John of Ripa, Durandus, Gregory of Rimini, and William of Ockham. For several centuries, this work stood as a classic source for Thomistic theology and philosophy and was particularly prized by Paolo Barbò da Soncino and Silvestro Mazzolini da Prierio, authors of the *Divinum epitoma* (1521–1522) and the *Opus in Capreolum* (1498) – both compendia of Capreolus’ *Defensiones*.

The Holy Roman Empire

Another Parisian scholar and colleague of Capreolus was a Dutch diocesan priest named Henry of Gorkum (Henricus de Gorricheum, d. 1431), the founder of the *Bursa Montana* (after 1420) an important college at the University of Cologne in Germany (cf. Hoenen 2012, 210–215). Especially notable among his works is the *Quaestiones in Summam Sancti Thomae* (ed. Esslingen 1473), which began the period of commentaries on Aquinas’s major works, and, in particular, the commentaries on the *Summa Theologiae*. This orientation of the Cologne scholars of the *Bursa Montana* can also be seen in the works of Gerardus de Monte (d. 1480), with his *Commentum in Thomae Aquinatis tractatum De ente et essentia* and *Tractatus ostendens concordiam Thomae Aquinatis et Alberti Magni* (ed. ca. 1485). In fact, the first commentator on the *Summa Theologiae* was probably Ioannes Tinctoris de Tornaco (d. 1469) from the same university, where Thomism was introduced and developed not by Dominicans but by secular masters (Goris 2002, 17–23; Bonino 2000a, 225–226). In any case, this German Thomist school was very important for its role in confronting the Albertists, toward which these Thomists had varying attitudes, sometimes polemical, sometimes conciliatory (Hoenen 2008, 127–130). In addition to this focus, the German Thomist school certainly left its mark with its commentaries on Aquinas’s works, especially on the *Summa Theologiae*. To complete our

overview of German Thomism, we must also mention Peter Schwarz of Kadaň in Bohemia (Petrus Nigri de Cadena, d. 1484), the first rector of the University of Buda in Hungary and author of the *Clypeus Thomistarum sive Quaestiones super Arte veteri Aristotelis* (Venice 1481). This work represents a late, very precise, sometimes eclectic and polemical reception of Hervaeus Natalis' and Capreolus' interpretations of logic (Bonino 2002, 182; Jindráček 2011, 493–497). We might also note a secular master and philosopher of the University of Paris, John Versor (Jean le Tourneur, d. ca. 1482), author of scholastic commentaries on almost all the works of Aristotle, on Peter of Spain, and on Aquinas's *De ente et essentia* (ed. Cologne ca. 1487). Versor has often been characterized as an “albertising” Thomist, and his wide reception is well documented in Germany and in Central Europe (Bonino 2000b, 630–631, 638, 642, 652).

The Byzantine Empire

A very special chapter in the history of the school might be entitled “Byzantine Thomism,” a movement active in the fourteenth and fifteenth centuries. This movement represents a long-term convergence between eastern and western intellectuals, which was related to the pressure of the Ottoman Empire, the international culture at Venice, and the Ecumenical Council of Basel–Ferrara–Florence (1431–1449). During this period, a number of Byzantine orthodox theologians and philosophers expressed great interest in Aquinas's work, translated his works into Greek and commented on them. Some, like Demetrios Kydones (d. 1398), translator of the *Summa contra Gentiles*, even converted to Catholicism and entered the Dominican Order. With the collaboration of his brother Prochoros (d. ca. 1369), Demetrios also translated the *Summa Theologiae* and the *De rationibus fidei*. One should also mention three Greek Dominican brothers: Maxim, Theodor, and Andreas Chrysoberges, who were active in the first half of the fifteenth century. Finally, Gennadios Scholarios (d. ca. 1473), the Orthodox Patriarch of Constantinople, translated both *Summae* and the *De ente et essentia* into Greek, along with

Armandus' commentary on the latter work (Plested 2012, 222–228; Porro 2012, 474–475; Ganchou 2002, 446–469).

Italy

The heyday of Thomism during the Renaissance came during its development in Italy, especially in the Dominican centers of studies in Bologna and Padua. The Italian university setting of the fifteenth century witnessed an immense resurgence in the study of Aristotle and Plato. The revalorization of classical languages, the importance placed on reading texts in the original language, and the free exchange of ideas among all philosophical schools present at the time encouraged the general public in a humanistic orientation (Kristeller 1974a, 853–858). In a certain sense, this critical spirit is apparent in the work of one of Bologna's Dominican masters, Pietro Maldura da Bergamo (d. 1482), author of the *Tabula operum Thomae Aquinatis* (called “Tabula Aurea,” ed. Bologna 1473), and the *Ethimologiae id est Concordantiae conclusionum in quibus D. Thomas videtur sibimet contradicere* (ed. Venice 1476). These are two closely related works: the *Tabula* is a brief explanation of keywords in Thomas' thought, while the *Concordantiae* compares various texts of Thomas to resolve difficulties and seeming contradictions (Guyot and Sterli 2003, 597–605; Colosio 1961, 123–129). This work had a great influence for many centuries. The invention of the printing press around 1450 had generally accelerated the spread of all texts; for Thomists, this presented an opportunity for the wider dissemination of Aquinas's own works. This development was closely linked with the first critical studies that sought to distinguish between authentic and inauthentic works as well as efforts to establish the most accurate text, using the surviving manuscripts. The first printed edition of Aquinas's works was probably the *Summa de articulis fidei* (Mainz, ca. 1460 perhaps by Johannes Gutenberg himself).

Another important figure in Italian Thomism was Dominic of Flanders (born Beaudouin Lottin, d. 1479). A former disciple of John Versor and professor at the University of Paris, Dominic arrived in Bologna and entered the Dominican

order in 1461. With extraordinary effort, he engrossed himself in the study of Aquinas's logic and metaphysics (Tavuzzi 1993, 95–98). Among his philosophical works the *Summa divinae philosophiae*, also called the *Quaestiones in XII libros Metaphysicae* (ed. Venice 1499), and the *Commentaria super libros De anima Aristotelis* (printed in 1496) and the *Commentaria super libris Posteriorum Aristotelis* et in *De fallaciis divi Thomae* (ed. Venice 1507) are especially noteworthy. Dominic taught in Bologna, Pisa, and Florence, and many of his works have survived in manuscript form; one of its characteristics is the foundation of metaphysics and of “predicamental” common being, i.e., exclusively on created being.

Among other Bologna Thomists, one should note also Paul Barbò da Soncino (d. 1495), the author of the *Elegantissima expositio in artem veterem Aristotelis* (ed. Venice 1499) and in particular, his *Acutissimae quaestiones metaphysicales*, printed posthumously in Venice in 1498 (Jindráček 2008, 120–134). Silvestro Mazzolini da Prierio (d. 1527) also belonged to this group. A master of theology in Bologna, Padua, and Rome, his philosophical production includes the *Compendium dialecticae* (Venice 1496), the *Opus in Capreolum* (Cremona 1497), the *Conflatus ex Angelico Doctore S. Thoma* (Perugia 1519), and a polemical work against the Scotists of Padua, the *Malleus in falsas assumptiones Scoti* (Bologna 1514). At this time, the practice of writing Compendia of Logic or Dialectics also became well-established. Here, one could mention Girolamo Savonarola's *Compendium Logicae*, written in 1488 (Tavuzzi 1997, 24–38). Silvestro and other Thomists of this period (like many other thinkers) were interested in the socioeconomic question of the Mount of Piety, the late medieval Italian institutions for charitable works and financial loans, and produced short ethical and practical expositions defending them against the charge of usury.

For the systematic development of Thomistic philosophy, the work of Chrysostomus Javelli da Casale (d. 1538) is also important. His work offers a complete philosophical exposition, from logic and metaphysics to ethics, politics, and

economics, mostly composed in the form of questions about and explanations of the Aristotelian texts, including the *Liber De causis*. We should also take note of his treatise *De transcendentalibus* (after the somewhat neglected *De modis rerum* by Remigio dei Girolami d. 1319) which was probably the first systematic Thomistic treatise on the transcendentals.

Apart from Bologna, Thomism also gained strength at another major Italian university center, namely, Padua. While the Bologna Thomists paid close attention to Aquinas's texts, their authenticity, and concordance, the Padua Thomists engaged in extensive public debates with radical Aristotelians such as Nicoletto Vernia (d. 1499) and Pietro Pomponazzi (d. 1525) as well as with Scotists such as Antonio Trombetta (d. 1517). It was in this setting that there emerged the great figure of Thomas De Vio – the future cardinal Cajetan (d. 1534) – who even today is often thought of as being virtually the sole representative of Thomism in this period. In addition to his commentaries on Aquinas's *Summa Theologiae* (1508–1523), his biblical commentaries (1520), and his debate with Martin Luther in 1518, which have given him a permanent place in the history of theology, Cajetan also left many remarkable purely philosophical writings. These latter works have been a subject of interest among researchers for several centuries. Among his books, one needs to mention at least the most important titles: *In De ente et essentia D. Thomae Aquinatis* (written 1493–1494), the *Commentaria in Posteriorum Analyticorum* (1496), *In Isagogen Porphyrii* (1497), *In Predicamenta Aristotelis* (1498), *De nominum analogia* (1498), and the *Commentaria in De anima* (1509). Cajetan also “completed” Aquinas's unfinished commentary on the *Peri hermenias* (book II, lectiones 3–14 in 1496), a common custom in scholastic literature. The author of an imposing corpus, Thomas De Vio encountered much criticism and doctrinal opposition from the outset, even within his own Dominican Order. Special should be given to his views about the (im)possibility of an apodictic demonstration of the immortality of the human soul and his particular conception of the analogy of being,

namely, the analogy of proportionality (Giacon, I, 131–134; Hochschild 2010, 146). His influence and authority (he was Master General of the Dominicans from 1508 to 1518 and named cardinal in 1517) seem to have helped bring about the gradual replacement of Peter Lombard's *Sententiae* by Aquinas's *Summa Theologiae* as the standard book for theological formation in the sixteenth century (Jindráček 2009, 257). Here, a significant collaborator was Conrad Koellin (d. 1536), as witnessed by his correspondence with Cajetan in 1521 and 1522. Finally, it is worth mentioning an interesting seventeenth-century effort by Tommaso Maria Giovi to compile Cajetan's physics and metaphysics on the basis of his extant writings (cf. *Libri octo De Physica* (...) *Thomae a Vio Caietani*, Bologna 1683 and *Metaphysica eminentissimi et reuerendissimi P. F. Thomae a Vio Caietani*, Bologna 1688).

A contemporary of Thomas De Vio was Francesco Silvestri da Ferrara (d. 1528), called the Ferrariensis, who taught in Mantua, Milan, Ferrara and Bologna. In the history of Thomism, he is recalled mainly as a commentator on Aquinas's *Summa contra Gentiles* (Venice 1524). Ferrariensis engaged in significant discussions on the human soul, the principle of individuation, analogy, and the theory of knowledge. His commentaries on Aristotle include the *Annotationes in libros Posteriorum Aristotelis et sancti Thomae* (Venice 1517), the *Quaestiones luculentissimae in octo libros Physicorum Aristotelis* (Venice 1601), and the *Quaestiones luculentissimae in tres libros de Anima Aristotelis cum additionibus ad easdem et aliis quaestionibus philosophicis Matthiae Aquarii* (Venice 1619). This last work was printed with the additions by Mattia Aquario (d. 1591), author of the *Dilucidationes in XII libros primae philosophiae Aristotelis* (ed. Rome 1584). Mattia Aquario taught in Milan, Rome, and Naples.

The *Editio Piana* 1570

The importance and value of Thomas' work in this period were undoubtedly enhanced by the influence of the Dominican Pope Pius V. In his bull *Mirabilis Deus* (April 11, 1567), the Pope set Thomas side by side with the Doctors of the

Church (Walz 1967, 156, 169–173) and presented his work as the best defense against heretical doctrines (doubtless an allusion to the Protestant Reformation). Afterwards, he ordered the printing of a high-quality edition of the first *Opera Omnia* of Aquinas (the so-called *Editio Piana*, Rome 1570), prepared at the studium housed in the Roman Priory of Santa Maria sopra Minerva. Consisting of 17 volumes (with the *Tabula Aurea* of Pietro da Bergamo in the 18th vol.), the edition was undertaken by a commission composed of Cardinal Vincenzo Giustiniani (d. 1582), a former Master General of the Dominicans, and Tomás Manrique (or Manriquez d. 1573), Master of Sacred Palace, in collaboration with Remigio Nannini (or Nanni, d. 1581) and others (cf. Walz 1967, 159; Bataillon 1991, 142–143; Grendler 2006, 25–28). In these years, the General Chapters of the Dominican Order also determined a precise plan for the study of Aquinas and his commentators (Capreolus and Cajetan) for the centers of study and ordered the purchase of the *Editio Piana*. In this edition, the text of the *Summa Theologiae* and the *De ente et essentia* were accompanied by Cajetan's commentaries and by Ferrara's exposition on the *Summa contra Gentiles*.

Spain and Portugal

In Spain, the renewal and expansion of Thomism gained stimulus from the Paris Thomists. At the beginning of this process there emerged a fascinating character, the Flemish scholastic philosopher Peter Crockart of Brussels (d. 1514). Originally a disciple of the Scottish philosopher John Major (d. 1550), Peter found his way from the dominant school of Nominalism to Thomism, joined the Dominican Order, and published several philosophical commentaries. Among these, a note should be taken of his commentary on the whole of Aristotle's *Organon* (*Acutissimae quaestiones et quidem perutiles in singulos Aristotelis logicales libros* with the *Quaestiones super opusculum Sancti Thomae De ente et essentiali*, Paris 1509), the commentaries on the *Physics* and the *De anima* (*Argutissimae subtiles et fecundae quaestiones physicales* (...) *in octo libros Physicorum et in tres De anima*, Paris 1510), and an exposition on Peter of Spain's

logic (*Summularum artis dialecticae*, Lyon 1512). Crockart formed a very important pupil, Francisco de Vitoria (d. 1546). He and another Spanish Dominican, Diego de Deza (d. 1523), the Grand Inquisitor of Spain and a crucial supporter of Christopher Columbus, would play a decisive role in the development of Thomism in Spain, particularly at the University of Salamanca. Vitoria enters the history of human thought primarily as a co-founder of international law and political philosophy. He was especially noted for his contributions to just war theory, the Law of Nations (*ius gentium*), and the development of the concept of distributive justice (*iustitia distributiva*). Among his works, one should note the *Relectio de potestate civili* (1528) and the *Relectio de Indis et de iure belli* (a part of the *Relectiones Theologicae XII*, ed. Lyon 1557). Another important representative of the Salamanca school was Francisco de Vitoria's successor, Domingo de Soto (d. 1560) (Belda Plans 2000, 399–500). Besides his predominantly theological writings on grace, Domingo wrote numerous philosophical works reflecting a fairly original form of Thomism, including the *Summule* (Burgos, 1529), *In libros posteriorum Aristotelis, sive de Demonstratione absolutissima commentaria* (Venice 1574), and in particular the *Super octo libros Physicorum Aristotelis commentaria* (Salamanca 1555). In this last work, Soto expounded a theory of bodily motion (*motus uniformiter difformis*), which is in a way very close to the later theories of Galileo (Wallace 1997, 271–273). Galileo read Soto and was clearly aware of the Spanish Dominican's physics. The best-known representative of the Salamanca and Valladolid school, however, is undoubtedly Domingo Báñez (lat. Bannes, d. 1604), a pupil of Diego de Chaves (d. 1592), Melchior Cano (d. 1560), Pedro de Soto, (d. 1563), and Diego de Chaves (d. 1592). His theological writings include the *Scholastica Commentaria in Primam Partem Angelici Doctoris* (Salamanca 1584, 1588), the *Scholastica Commentaria in Secundam Secundae Angelici Doctoris* (Salamanca 1584, 1594), and the *Apologia Fratrum Predicatorum* (1595), and made an important contribution of the discussion on predestination and the divine

knowledge of future contingents. He also presents a number of philosophical ideas on the human soul and intellect and makes a contribution to the philosophy of nature. Among his philosophical works, one should mention the *Commentaria et quaestiones in duos Aristotelis Stagyrtae de Generatione et corruptione libros* (Salamanca 1585) and his book on logic, the *Institutiones minoris Dialecticae quas Summulas vocant* (Salamanca 1599). Among Báñez's students, several excelled in philosophy, especially Diego Mas (d. 1608) and Juan Sanchez Sedeño (d. 1615). Mas, who taught mainly at Valencia and Salamanca, became famous along with Ch. Javelli as one of the first authors of a systematic metaphysics that was not a commentary on Aristotle's text (*Metaphysica disputatio de ente et eius proprietatibus*, Valencia 1587). Sanchez composed a book of logic (*Aristotelis Logica Magna*, Salamanca 1600). He was familiar with Hervaeus and Crockart. Sanchez still attracts the interest of logicians today (Lacca 2012, 109–124). Another very original Spanish Thomist was Francisco de Araujo (d. 1664) with his two-part commentary on Aristotle's *Metaphysics* (*Commentariorum in universam Aristotelis Metaphysicam*, Salamanca 1617, 1631).

In a way, Thomism in the Renaissance period achieved a natural completion and a new direction with the so-called Baroque Thomism of the Portuguese Dominican John of St. Thomas (João Poinso, d. 1644). After his studies at the Universities of Coimbra and Louvain, John taught at the University of Alcalá (today a part of Madrid). His *Cursus Philosophicus Thomisticus* contains an exposition of logic and philosophy of nature (physics and psychology). John's work thoroughly utilizes the whole Thomistic philosophical tradition and presents a remarkable theory of signs, itself the subject of long-standing interest among many philosophers.

Impact and Legacy

Thomistic philosophy in the Renaissance period, taken in the broad sense as extending 1350–1650, was marked by six important historical

developments: radical Averroist Aristotelianism in Italy, Humanism, the witch trials, the Protestant Reformation, the foundation of the Society of Jesus, and the discovery of the New World.

Medieval Thomism had already studied the Arabic commentators on Aristotle, especially Averroes, and this interest had at once enriched Thomism and helped it to recognize unacceptable doctrinal solutions. In the Renaissance, this exchange led to a confrontation between Thomists and the world of Italian lay teachers and philosophers, especially on the issue of the philosophical repudiation of the soul's natural immortality. The result was a Thomistic polemic against such men as Nicoletto Vernia (d. 1499) and his students Pietro Pomponazzi (d. 1525) and Agostino Nifo (d. 1538). Nifo, however, would eventually become an important ally of the Thomists (cf. Nardi 1958, 383). In this controversy, perhaps the most intense debate took place between Bartolomeo Spina da Pisa (d. 1546) and Silvestro Mazzolini da Prierio (cf. Tavuzzi 1995, 47–58). In his *Propugnaculum Aristotelis de immortalitate animae contra Thomam Caietanum* (ed. Venice 1519), Spina was de facto arguing against Pomponazzi as much as against Cajetan.

The Thomists' encounter with Humanism constituted a similar chapter in history. Although the Thomists never adhered to the principles of Renaissance Humanism, they never ceased having an active exchange with it and regularly engaged in public debates with its leaders. The most important debates took place between the following figures: Cajetan and Giovanni Pico della Mirandola at Ferrara (about 1494); Cajetan and Erasmus of Rotterdam (Cossio 34–35, 231–239); Girolamo Savonarola and Pico della Mirandola; Paolo Barbò da Soncino and Gianfrancesco Pico della Mirandola; Vitoria and Erasmus; as well as Juan Luis Vives. One of the positive consequences of this exchange of ideas seems to have been an increased interest in the Greek philosophical commentaries on Aristotle (e.g., Francesco Silvestri da Ferrara) and other ancient schools of thought such as Neo-Platonism (e.g., Javelli), as well as a greater interest in classical and biblical languages in general. Although the trial and execution of the former Dominican

and Renaissance pantheist Giordano Bruno in 1600 is well known to the general public, this event had no practical consequence on the history of the Thomist school.

A number of important Thomists in this period (e.g., Prierias, Spina, Deza) actively participated as judges or consultants of the inquisitorial courts, whether in cases of heresy or witchcraft (cf. Abbiati et al. 1984, 218–228, 254–266). These authors also left a number of remarkable writings in the field of demonology, which are interesting from a philosophical point of view because of their conception of the influence of separate substances (demons) on the human soul and matter, and for their theories of separate substances as possible causes of physical transformation and movement; e.g., Spina, *De strigibus*, 1523 or Prierias, *De strigimagarum daemonumque mirandis libri tres*, 1521 (cf. Tavuzzi 2007, 43–46, 109; Id. 1997, 58–59, 102, 124–127).

There is no doubt that Martin Luther (d. 1546), John Calvin (d. 1564) and the subsequent Protestant Reformation and Catholic Reform affected the whole of Europe – and indeed the whole Christian world. From the first, a number of Thomists were engaged in intense combat with the thought of Luther, like Prierias or Cajetan. Cajetan, for example, entered into direct discussion with Luther at Augsburg in October of 1518, but this event had no direct impact on the subsequent course of events. It is also true that many Thomists, especially Domingo de Soto, Pedro de Soto, Melchior Cano, Bartolomeo Spina, actively participated in the Council of Trent (1545–1563), but the substantial part of this conflict was played out at the theological level (the interpretation of the Bible, the question of Tradition, the authority of the Church, the question of justification and the sacraments, etc.). Some indirect results of Europe's confessional division included an ever-increasing skepticism about philosophical argumentation and the loss in many places of university teaching chairs by Catholic and thus Thomistic professors. Another indirect consequence of the Protestant Reformation was that, in the territory of the Holy Roman Empire, various religious centers of study closed entirely,

the interaction between different scholastic schools of thought declined, and the demand for official doctrinal unity in the Catholic camp grew, rendering open conflict between different philosophical schools undesirable – particularly in public, though confessional, universities in Catholic countries that had strong Protestant minorities.

A very difficult chapter in the history of Thomism is the role played by the most important new religious order of the era, the Society of Jesus, formed in 1539/1540 by Ignatius of Loyola (d. 1556). Although the Jesuits declared their interest in the study of Aquinas's thought from the beginning, with the rapid expansion of their Order, they soon created their own school of thought. Already by the end of the sixteenth century, the Jesuits came into sharp conflict with the main representatives of "integral" or "strict" Thomism, a group led mainly by the Salamanca Dominicans. The main protagonists of the dispute were the Spanish Jesuit Luis de Molina (d. 1600), a pupil of Pedro da Fonseca (d. 1599) and a professor at the University of Évora in Portugal (which published his famous book the *Concordia liberi arbitrii cum gratiae donis, divina praescientia, providentia, praedestinatione et reprobatione Concordia*, Lisbon 1588), and Domingo Bañez, who responded sharply to Molina in his *Apologia Fratrum Praedicatorum* (1595). Both camps had significant early followers. On the Molinist side, these included Pedro Arrubal (d. 1608) and Gregorio de Valencia (d. 1603); on the Thomist side, Tomás de Lemos (d. 1629) and Diego Álvarez (d. 1635), together with the Roman Commission (*Congregationes De auxiliis* 1598–1607). This doctrinal controversy did not reach a definitive conclusion. The basic issue was the question of human freedom and the influence of or human dependence on divine grace and God's power (the *praemotio physica* of the Thomists), but this also entailed the question of God's knowledge, especially the knowledge of future contingent events (the *scientia simplex* of Thomists and the *scientia media* of Molinists). Although this problem is of a theological nature, it undoubtedly has a strong metaphysical component. Later on, the issue made its way into

philosophical courses as an example of the nature of causality, as in the French "baroque" Thomist Antoine Goudin (d. 1695, *Philosophia iuxta inconcussa tutissimaque D. Thomae dogmata*, IV pars, *Metaphysica*, Lyon 1670). From a philosophical perspective, the issue is all about the dependence of secondary causes on the First Cause and the metaphysical limits of human freedom. Thomists defended the primacy of the First Cause. Perhaps, the Jesuit philosophical school's most influential Spanish thinker was Francisco Suárez (d. 1617). He not only commented on Aquinas's *Summa Theologiae* but also wrote a number of original works, among which the *Disputationes metaphysicae* (1597) stands out. So-called Suarezinism is an original symbiosis of Scotism, Nominalism, and Thomism. Its relation to the Thomist school is difficult to determine. In the *De auxiliis* controversy, Suarez took a somewhat moderate position, known to history as "congruism." However, the Thomist critique also aimed at Suarez. In this and subsequent time periods, we see Thomism beginning to have a significant place outside of the Dominican Order. Religious Orders such as the Minims, Discalced Mercedarians, Discalced Carmelites, Trinitarians, and Benedictines all established Thomistic colleges.

The last major chapter of Thomism in the Renaissance period was its expansion into the New World, particularly in Central and South America and the Philippines. At the beginning of Spanish colonization, the Salamanca school and the Spanish Dominicans in general (Francisco de Vitoria and Bartolomé de las Casas, d. 1566) defended the *ius gentium* or the natural right of the Native Americans. The leaders of the Salamanca school began to establish universities in the newly discovered territory that were under the protection of the Pope and the Spanish government. The most important foundations were as follows: in 1518, the General Stadium, and the future University of Santo Domingo in Santo Domingo; in 1551, the University of Lima San Marcos founded by Tomás de San Martín (d. 1555); in 1580, the University of Bogotá; in 1619 the University of Santiago de Chile; in 1611, the foundation of

the *Colegio de Nuestra Señora del Santísimo Rosario*, the future (1645) University of Santo Tomás; we should also note the academic activities of Juan Solano (d. 1580, the future founder of the College of St. Thomas in Rome at the Minerva), in Cuzco (Peru) and of his confrere Francisco de La Cruz (d. 1660). These academic centers now began to transmit Europe's scholastic tradition (in the case of the Dominicans, the Thomistic doctrine) and produce their own academic literature.

Abstract

This entry examines the impact of Thucydides in the Latin West on political thought, from Leonardo Bruni to Hobbes.

Biography

The Athenian Thucydides wrote the *History of the Peloponnesian War* (431–404 BC), in which he himself participated. Having lost Amphipolis to the Spartans in 424/423, he was exiled, but was probably able to return after the capitulation of Athens. Thucydides lived to see the end of the war, but did not have time to finish his work, so he is believed to have died around 400 BC.

The *History* has always been admired for the speeches of politicians and generals that we find interspersed with the ordinary narrative. In a completely innovative manner, they constitute a dialectic investigation into the nature of politics and power. Thucydides maintained that while keeping as close as possible to the general sense of a given speech, he would make the speakers say what, in his opinion, the situation had called for (1.22.1). Other celebrated passages are the proem with the so-called *Archaeology*, treating the early history of Greece (1.1–22); the description of the plague in Athens (2.47.3–54); and the description of the civil war in Corcyra (3.81–84).

During the Middle Ages, Western readers had no direct knowledge of Thucydides' work. This changed around 1400, with the renewal of interest in Greek in Italy. An early student of Thucydides was the Florentine humanist Leonardo Bruni (1370–1444). In his speech for the condottiere Nanna Strozzi (1427–28), he imitated Pericles'

funeral oration, to the point where he boasted of the popular government of Florence, just as Pericles had exalted Athens' democratic constitution. Bruni's oration marks a shift in Western political thought which had until then generally accepted Aristotle's somewhat negative view on democracy.

The *History* gained wider circulation when it was translated into Latin by Lorenzo Valla (1407–1457); finished in 1452, Valla's translation remained in use until the nineteenth century. Not least with regard to Thucydides' political vocabulary, Valla came to influence later translators of the *History*, among them Philip Melanchthon and Giovanni della Casa.

Philip Melanchthon (1497–1560), *praeceptor Germaniae* and Luther's close collaborator, translated several speeches, but even more important is his Latin version of Thucydides' chapters of the civil war in Corcyra, the description of how politics changed the meaning of words. First published in 1542 as the opening text of his *Instructions in Dialectic*, it became hugely popular and was reprinted numerous times.

During the sixteenth century, Latin translations of the speeches abound, their prefaces stressing how they contain important political lessons. We see a practical example of this in the work of the Italian diplomat and writer Giovanni della Casa (1503–1556) who translated several speeches in the mid-1540s as a rhetorical exercise to prepare himself for his own official speeches. There is also a strong Thucydidean influence in Casa's political letters.

Thomas Hobbes' (1588–1679) English translation was first printed in 1629. In the *History*, Hobbes found many of the ideas fundamental for his later political thought, such as the view on human nature, the function of fear, and the effect of ambition on political associations. For both writers, their investigation into the nature of men was the point of departure for political analysis: man being what he is, how may we create, and preserve, the good society? Thucydides and Hobbes shared a skepticism towards democracy, and although aristocracy was perhaps a better form of government, it was still liable to break up into warring factions. In his *On the Life and History of*

Thucydides (Hobbes 1629, a2r), Hobbes emphasizes that Athens under Pericles had in fact a government of one man and that Pericles himself was of royal descent. Apparently, Hobbes read into the *History* a preference for monarchy, and he used Thucydides' account of Greek fifth-century politics to argue in favor of absolute monarchy, in opposition to classical political theories like those of Aristotle and Cicero.

Tignosi, Niccolò

Born: 30 March 1402, Foligno

Died: 14 September 1474, Pisa

David A. Lines

Italian Studies, School of Modern Languages and Cultures, University of Warwick, Coventry, UK

Abstract

Niccolò Tignosi was a physician and professor of medicine active in Tuscany (especially Florence) in the second and third quarters of the fifteenth century. More or less at the same time in which Johannes Argyropoulos began his famous activity of interpreting Aristotle there, Tignosi published a commentary on Aristotle's *Nicomachean Ethics*, which received a rather hostile response from his contemporaries, prompting him to defend himself in a very interesting opusculum. He also wrote on Aristotelian logic and psychology and penned a series of historical and political treatises, displaying a desire to remain close to the Medici family. His works point to the numerous intersections between humanism and scholasticism in Renaissance Florence.

Alternate Names

[Tignosius de Fulgineo, Nicolaus](#)

Biography

Little is known about the education of Niccolò (the son of Iacobus, a doctor of law), who hailed

from Foligno, but whose university studies may have taken place in Bologna, Siena, and/or Perugia (the following sketch is based mainly on Sensi 1971–1972; see also Thorndike 1927, 1929, pp. 161–170; Rotondò 1958; Barale Hennemann 1974, pp. 33–111; Field 1988, pp. 136–158). Rotondò maintains that he was taught by Ugo Benzi and Gaspare Sighicelli in Siena, but several times Tignosi describes himself as a student of Paul of Venice (who taught in Perugia from November 1424 and in Siena in 1427). For at least 1 year (1426–1427), Tignosi taught logic in Bologna. In 1428, he was engaged in military activities in Milan. We then find him studying and teaching medicine in Perugia (1428 to c. 1438). He also taught medicine (“theorica”) and philosophy in Florence from c. 1439 (an important time in Florence because of the presence of the Church Council there between January 1439 and September 1443). Probably early on, he lectured there on Aristotle’s *Posterior Analytics*, for which he requested a fresh translation from his humanist friend Giovanni Tortelli. Shortly afterward, Tignosi moved to Arezzo, where by 1442 he had married Angela, the daughter of Count Domenico de Marsuppini, and had acquired Aretine citizenship. A new period of teaching in Florence started around 1450 and lasted until 1464. During this time, Tignosi authored the *Expugnatio Constantinopolitana*, published his commentary on Aristotle’s *Nicomachean Ethics* (with relative defense treatise), and supposedly instructed Marsilio Ficino. (The evidence for the latter, uncomfortably slender, is summarized in Field 1988, p. 140, n. 43.) He was called to teach in Arezzo in 1464 (Vasoli 2006); we then find him in Todi (1468–1471) and in Narni (1472) before his teaching career resumes in Pisa (where the Florentine *studio* had just been transferred) in 1473–1474 (the year of his death). To this later period belong Tignosi’s remaining works, including *De origine Fulginatum*, *De ideis*, and the commentary on *De anima*, completed shortly before his death.

Although it is difficult to reconstruct Tignosi’s intellectual network outside of Florence (except for his ties to Paul of Venice), in Florence he had numerous friendly

contacts (deserving further exploration) with the intellectual avant-garde, including Tortelli, Poggio Bracciolini, Benedetto Accolti, Carlo Marsuppini, as well as Donato Acciaiuoli and Ficino. It is unclear what Tignosi’s relationship was, if any, with Johannes Argyropoulos, who in February 1457 started lecturing publicly on Aristotle’s *Ethics* in Florence and whose interpretation Tignosi opposed in the dedication letter to his *Ethics*.

Impact and Legacy

Other than being (supposedly) Ficino’s teacher, Tignosi is best known for a controversy that erupted in Florence, probably between 1461 and 1464, after the publication of his Latin commentary on Aristotle’s *Nicomachean Ethics*. The commentary (studied in Rotondò 1958, pp. 228–233; Sensi 1971–1972, pp. 385–388; Field 1988, pp. 140–145, 148–150; Kraye 1995, pp. 101–102; Lines 1999a, b, 2001, 2002, pp. 192–206, 490–491) is based on Leonardo Bruni’s translation of the text (1416/1417), reflecting Tignosi’s interest in recent translations (used also for his commentaries on the *Posterior Analytics* and *De anima*). The presentation copy, dedicated to Piero de’ Medici, must date to 1461, when Piero was the *gonfaloniere*, but the work was probably written earlier. The *Commenta* is unusual in terms of its approach. While treating philosophical issues, the work is obviously directed to a mixed audience, a good portion of which has no formal training in philosophy. It, therefore, explains fairly elementary philosophical concepts while also offering elements that make the work less scholastic. Indeed, Tignosi eschews *quaestiones*, neglects the traditional practice of *divisio textus* (i.e., of breaking down the text into its constitutive elements), occasionally uses Greek, and provides abundant historical examples (from both classical and contemporary times) as well as quotations from poetry (Kraye 1995, pp. 101–102). It is thus quite different from many contemporary Florentine commentaries on the same work (e.g., Guglielmo Becchi, Donato Acciaiuoli). In terms of its main sources, it

depends strongly on Averroes, Albertus Magnus, and St. Augustine (Lines 2002, p. 193).

Tignosi evidently misjudged the expectations of his commentary's audience; reactions to it were strong. Tignosi was forced to defend himself against his detractors (which included both humanists and scholastics) in a treatise entitled *Nicolai Fulginatis ad Cosmam Medicem in illos qui mea in Aristotelis commentaria criminantur opusculum* (see Rotondò 1958, pp. 233–241; Sensi 1971–1972, pp. 388–395; Lines 2002, pp. 206–214). In this work, Tignosi had to answer both for his practice of providing strongly philosophical explanations of the text and for his use of historical examples and poetical quotations. The work, which is sophisticated and deeply interesting, offers a glimpse into the cultural climate of Florence in a period in which the tastes of some tended to be very much confined either to literature and history or to philosophy. Tignosi presents himself as wishing to bridge the two: his appeals to poetry and history are actually, he says, an imitation of what Aristotle himself had done. His example is not, however, one that is immediately embraced by his contemporaries, although it makes for interesting comparisons with the approach of the Frenchman Jacques Lefèvre d'Étaples a few decades later (Kraye 1995; Lines 1999b, p. 266, 2007, p. 289) and with that of Bernardo Segni in 1550 (Lines 2013, pp. 845, 852, 856–858).

Other aspects of Tignosi's work that have been examined but merit further attention include his exaltation of medicine over law and his "philosophy of ends" (Field 1988, pp. 142–158); his views of friendship, his relationship with the Medici family, and his political statements (Sère 2007, pp. 373–381); his theory of the soul and presumed Averroism (on the basis of his *De anima* commentary, published in 1551, it seems that Tignosi accepted some of Averroes' views; see Hasse 2004); and his relationship to Florentine Platonism (his treatise *De ideis* suggests that Tignosi was opposed to the kind of reconciliation of Plato and Aristotle attempted by Donato Acciaiuoli; for comments and historiographical summary, see Sensi 1971–1972, pp. 414–422). Finally, interesting work has been done (but much more remains

to be explored) on Tignosi's work in relationship to artistic theory and practice in Quattrocento Florence (Pfisterer 1999, 2001), a subject that his writings (particularly the *Ethics* commentary) mention fairly often.

Tignosi's status as a figure of some (if minor) prominence in Florence seems indicated by his appearance as a fictional character ("Niccolò") in Bracciolini's dialog on the relative merits of medicine and civil law in the second part of his *Historia disceptativa convivialis* (1450). He is possibly also the "Nicolaus medicus" of Lorenzo Pisano's *Dialogi quinque* (late 1450s or early 1460s) (Mercati 1938, pp. 284–285). Field underlines his possible influence on Bracciolini's legal humanism and on Ficino's philosophical viewpoints but is doubtful of his broader significance after the 1450s (Field 1988, p. 155). Further studies will confirm the contours of his legacy.

Time in Renaissance Philosophy

Olivier Dubouclez
Department of Philosophy, University of Liège,
Liège, Belgium

Abstract

As a central dimension of the Human experience, the conception of time has undergone

deep transformations during the Renaissance period, in relationship with global evolutions in European arts, sciences, and metaphysics. The Aristotelian definition of time as “a number of motion in respect to before and after” was challenged to open the way to an ontological determination of time, independent from motion and connected to the divine structure of beings in the universe. From Ficino to most innovative thinkers like Telesio or Patrizi. Bruno in particular introduced a relativistic perspective and showed that we should rather speak of a multiplicity of times. The reflection on the difference between time and duration has been another technical issue developed by Renaissance thinkers: since time was no more referred to in the Ptolemaic cosmos, the concept of duration was used to designate the internal time of things and existing beings, as Suarez makes clear at the beginning of the seventeenth century. This idea of time as an inner reality also had important applications in the field of literature and moral philosophy, as we see for instance in Shakespeare and Montaigne. Although Modern Philosophers like Descartes or Pascal seem to break with the scholastic approach of time, it is interesting to note that the pre-Newtonian concept of “absolute time” is rooted in Renaissance theories of time and the development of Copernicanism leading to the construction of a new reference frame, where the Suarezian “imaginary time” plays a central role.

Heritage and Rupture with the Tradition

More than in any other period in the history of thought, the complexity and the fallibility of the philosophical definitions of time have been the object of close scrutiny during the Renaissance. While most of the medieval thinkers concentrate on Aristotle's *Physics* IV, 10–14, and tackle obscurities or objections that can be raised about the Aristotelian conception of time, the rise of humanist scholarship combined with a renewed access to ancient doctrines (Neoplatonism, but also Epicureanism, Stoicism, or Averroism) broadens the field of available references and

leads Renaissance thinkers to question the authority of the Aristotelian framework. Far from disappearing outright, the medieval language of time maintains itself in those debates: the distinction between the three modes of duration, eternity (*æternitas*), perpetuity (*ævum*), and time (*tempus*) as introduced in the course of the thirteenth century by the *Summa Halensis*, still informs theoretical inquiries. But during the Renaissance, the philosophical study of time aims not so much at solving problems of interpretation raised by Aristotle's texts as at helping to build a global and coherent view of the cosmos. Insofar as Neoplatonism provides a system of thought where time is primarily referred to eternity and motion is secondary to time itself, Aristotle's canonical definition of time as "a number of motion in respect to before and after" is indeed replaced by an alternative ontology. Marsilio Ficino (1433–1499) is the prominent figure of such a transformation: according to him, time must be regarded as something of the world soul and, for this reason, it can neither be produced by motion nor be an accident or a property of it. In the Plotinian view that he promotes, time is "life" itself as it flows from the activity of the world soul and is tied up to eternity through a hierarchy of derivative forms of being. Ficino's philosophical program is coupled with a religious agenda, building a new Christianized cosmology and also, to this extent, facing the difficulties of compromise – as one can see from the uneasy combination of the linear conception of Christian time with the cyclical model exposed in Plato's *Timæus* (Prins 2014).

That time is a moving image of eternity does not mean, however, that it is a mere shadow or appearance. In the Neoplatonic view, it pertains to the very structure of things as they are ordered and divinely produced. Neoplatonic thinkers are eager to underline what may be the deepest flaw of Aristotelianism, namely the confusion between the knowledge of time (how do we come to know it?) and the ontological perspective (what is time and what is required for it to be?). Indeed, that the perception of time implies the existence of motion does not mean, as Aristotelians contend, that the very existence of time actually depends on motion, as Pico della Mirandola (1463–1494) already suggests (Schmitt 1967). Time is prior to motion

according to Telesio (1509–1588), who sees it as an independent being having its existence in one-self and being like a receptacle of natural movements (Schumann 2004). Along with Bernardino Telesio and Francesco Patrizi (1529–1597), Giordano Bruno (1548–1600) develops a critical approach to Aristotle within a whole system of thought which, notwithstanding a few theoretical elements borrowed from the *Physics*, has no other goal than taking over the Aristotelian paradigm. Bruno's achievements are probably the most impressive as regards the theory of time. He views time as a species of duration and accordingly contends that it should not be seen as ontologically dependent on motion: it would be more correct to say that motion is related to time since we know of duration by looking at things as they move or change (Hutton 1977). But Bruno is also the heir of the Copernican revolution and for this reason, he considers that the very spectacle of heavens cannot be the measure of time any longer. The destruction of the Ptolemaic cosmology implies breaking with time as referred to the perfection of the *primum mobile* and favor, instead, an earthly reference, one point of view among an infinite variety of others (Seidengart 2015). According to Bruno's vision, there are many times rather than one time, each local time being one "age," that is to say, one aspect of eternity. The Platonic dualism between time and eternity plays an important role here: while "eternity" is seen as the genus of time or absolute duration, "age" is a particular fragment of it which is determined in connection to things in motion. Copernic himself did not feel the need of any updated conception of time, but he clearly provides a backdrop for understanding Bruno's theory as well as future attempts to think of time as different from motion and from celestial motion in particular (Blumenberg 1973; Daniel 1981).

But that some prominent Renaissance thinkers have chosen the tenuous bond of time with motion as a common target should not preclude another fact: namely, that Aristotle's authority has been defended throughout the Renaissance period. At the beginning of the seventeenth century, the Fathers of Coimbra, whose influence in European universities is well-known, continue to defend the idea that motion must be prior to time as what produces time and to focus on Aristotelian issues.

Innovative and Original Aspects

Now, does the autonomy of time as a concept mean that time is something real? For instance, can we hold time as an immaterial entity that flows without any reference to natural things?

The problem of the reality of time is all the more vivid since late medieval authors questioned the idea that time might be an independent being. William of Ockham's razor but also Duns Scotus's understanding of "existence" have led to the claim that time does not exist as something distinct from the existence of movement and, as a consequence, that such a distinction has no necessity, existence and intrinsic duration of a thing being one and the same. This is of course a strongly anti-Neoplatonic allegation: if time is not a property of moving things, it surely cannot be a property of an unchanging thing as eternity; it must be intrinsic to things themselves and therefore identical with them. Moreover, time is not the right word if we want to speak of what is really passing by: we should rather speak of "duration." Such a de-realization of time where time is made a property of the individual beings can be traced back to the Middle Ages, but it is given more influence at the end of the Renaissance, philosophers considering "not so much the relation between a thing and time, than the intrinsic duration of the thing itself" (Porro 1996). Following this trend, Francisco Suarez (1548–1617) has defended the view that duration is distinct from existence only "ratione" in his *Disputatio* 50, another anti-Aristotelian idea that has been challenged by the Fathers of Coimbra (Carvalho 2001). Of course, if duration is intrinsic to things, it is a problem to explain how time can be measured. Suarez maintains this possibility with the notion of an imaginary succession conceived as homogeneous and infinite to be applied to the enduring of a thing. What he calls "extrinsic time" designates time as measured by the reference to celestial movement and it is to be distinguished from the intrinsic account of time (Daniel 1981).

But when questioning the reality of time, one should not overlook the psychological side of the problem as it has developed not only in philosophy (Cassirer 1927) but also in the Renaissance literary tradition in order to explain how we think

of time, but also how we think and live *in* time (Edwards 2013). An important tendency in literature and arts leads authors to elaborate the personal experience of passage and mutability through "time-centered fictions" as we can see in Shakespeare who, as he is dependent on the Augustinian representation of time, holds time as being both a destroyer and revealer of truth (Hill 1997). This evolution, from the religious notion of the transience of life to the secular idea that temporal passage is a necessary condition of human experience, finds another striking expression in Montaigne's *Essays* who, better than any other philosopher, underscores that time is the most fundamental dimension of the self and the thinking of time must be linked with the very feeling of its successive flow.

Nevertheless, the problem remains to determine how human thought relates to time and this is quite a polemical matter in the field of Renaissance debates. Indeed, medieval authors, while theorizing the notion of a spiritual time proper to spiritual substances and distinct from the time of natural substances, have constantly refused to apply it to human souls (Steel 2001; Blum 2007). When Ficino speaks of "mora," a notion close to the medieval concept of discrete duration, he wants to preserve the human soul's immortality and he accordingly endows it with pure spirituality. The idea of a connection between time and the soul is not new; it can be found in Aristotle's *Physics* itself (*Physics* IV, 14). But along with Averroes' qualification of time as a mind-dependent attribute, reduced to the mental action of numbering, it has received wider consideration, especially in Italy during the course of the sixteenth century. Some followers of Alexander of Aphrodisias have attempted to think of intellection as a temporal reality, produced by a soul immersed within the natural duration of things. To this purpose, from Simone Porzio to Francesco Piccolomini, the Aristotelian concept of "act" is applied to human thought and sustained by a renewed description of the psychology of faculties and their mutual relationships. In such a context, time is conceived as an aspect of acts, either mental, corporeal, or involving both mind and body, such as sensation, intellection, or judgment. Because these acts occupy a very short lapse of

time or are said to be “instantaneous,” they are sometimes considered to be different components of one temporal activity rather than being autonomous operations or events (Dubouclez 2015). The old model connecting intellectual activity with time through the means of imagination, as it appears for instance in Thomas Aquinas, is challenged within this materialistic vision of man. Duration is no more a simple attribute of existence, but a real passage implying materiality and mortality.

Impact and Legacy

The legacy of the Renaissance conceptions of time must be appreciated in the light of the historiographical problem of continuity and discontinuity from Renaissance to modern times. In this respect, we might say that the Renaissance explanation of time, both Aristotelian and Neoplatonic, has mixed outcomes.

Indeed, we find in Descartes and Pascal a common attitude, namely the rejection of all philosophical definitions of time, vividly opposing the word-by-word method of explanation to be found in scholastic textbooks and even the very project of inquiring on time. Descartes in particular holds that duration and time are notions clear by themselves and that philosophical definitions obscure them and produce artificial difficulties. In the meantime, Descartes develops important reflections on the matter of time to be connected with late scholastic discussions, as debates around the doctrine of the “continuous creation” indicate. Pierre Gassendi (1592–1655) refuses the Cartesian idea that time is made of divisible parts or instants and also the conception of an intrinsic time proper to enduring things and especially to the *ego*; he has indeed a realistic conception of time as a global flow, while Descartes’ distinction between “duratio” and “tempus” (*Principles of Philosophy*, I, 55 and 57) is close to the distinction between “internal time” and “external time” in philosophical textbooks (Edwards 2013). But there are other aspects of the Cartesian doctrine that look hard to reconcile with the Aristotelian

views: for instance, when Descartes replies to Arnauld that the same kind of “succession” is to be found in the thinking substance as in natural things, he has a unified conception of time as flowing in the same manner in natural substances and in the self (Solère 1997). One might see Descartes’ theory of time as “temporal dualism” articulating a physical notion and a psychological notion of it, time being both a reality to be divided into parts and an innate idea and attribute of the thinking substance, announcing the Kantian notion of “a priori form” in the *Critique of Pure Reason* (Waller 2014).

This is obviously one of the most fruitful aspects of late Renaissance conceptions of time, namely the prevalence of duration over the Aristotelian cosmological approach, leading to the radical individuation of time as we see in van Helmont, who conceives of time as a biological and indivisible principle (Debus 1977). And it should be underlined that such a conception has also cosmological consequences of its own. Indeed, within another tradition that Renaissance thinkers are supposed to have initiated, namely the pre-newtonian concept of “absolute time,” imagination is attributed to a central role in the building of such a temporal reference frame. Renaissance scholars have shown that the “absolutization” of time has to be related to the development of Copernicanism, providing a response to the immobilization of the celestial spheres which is the consequence of the downfall of the Ptolemaic cosmology (Ariotti 1973), but also to the Suarezian notion of “imaginary time” as a means of measuring the intrinsic time or duration of things, a conception that will be prolonged by Gassendi and Gassendists (Bexley 2011).

Timpler, Clemens

Born: 1563/1564, Stolpen (Meissen/Saxony)
Died: 28 February 1624, Steinfurt (Westphalia)

Joseph S. Freedman
 Department of History and Political Science,
 Alabama State University, Montgomery, AL,
 USA

Abstract

Clemens Timpler (1563/4–1624) was a Reformed Protestant and professor of philosophy at the Gymnasium illustre Arnoldinum in Steinfurt (Westphalia). He was an independent and innovative thinker. His textbook on metaphysics, first published in 1604 and reprinted at least eight times by 1616, was his most influential work. He was best known for his view that All that is Intelligible (omne intelligibile) – and not an entity (ens) – is the subject matter of metaphysics. His influence was hampered in

part because virtually none of his contemporaries agreed with his views concerning All that is Intelligible. His writings were cited – both critically and uncritically – during his lifetime and for many decades following his death.

Biography and Publications

Clemens Timpler was born in Stolpen (Meissen/Saxony) in 1563 or 1564. His father, Clemens (the elder), served as mayor of Stolpen. The father of his wife (Clara) was Jacob Birckner, who served as mayor in nearby Bischofswerda. Clemens Timpler (the younger) had at least three brothers and at least three sisters. All three of his sisters (Maria, Catherine, and Regine) married Lutheran ministers. Two of his brothers (Abraham and Georg) were Lutheran ministers; the third brother (Andreas) was a rector at a Lutheran school. Clemens Timpler appears to have become a crypto-Calvinist by about the year 1580.

Clemens Timpler enrolled at the University of Leipzig in the year 1580. However, he then left Leipzig and apparently did not return there until the late 1580s. During his absence, he spent some time at the Gymnasium illustre in Zerbst and possibly also in Padua. After returning to the University of Leipzig, he earned his Bachelor of Arts (1588) and Master of Arts (1589) degrees. Timpler was a private teacher there in May 1592 when he refused to sign the Lutheran Formula of Concord and was therefore expelled from the University. Timpler went from there – as a Reformed Protestant – to the University of Heidelberg, where he enrolled on September 28, 1592. At Heidelberg, he was an administrator at the Collegium Casimirianum residence and was active in academic life at the University. While in Heidelberg, he taught – apparently in the capacity of a private teacher – Bartholomaeus Keckermann (d. 1609).

He left Heidelberg in 1595 in order to succeed Otto Casmann (ca. 1562–1607) as professor of physics at the Gymnasium illustre Arnoldinum in Steinfurt (Westphalia). By about 1600, Timpler was a professor of philosophy and served as a

prorector (1596, 1599, 1605, 1614/1615, 1620/1621) there. In Steinfurt, he married Elisabeth, daughter of Rütger Deichmann, who was mayor and an alderman there. He had at least four children: Rodoger (1602–1655), Christoph, Clara (d. 1625), and Clemens (d. 1637). He remained a professor of philosophy there until his death on February 28, 1624.

During his 3 years in Heidelberg, he presided over at least five published disputations and held at least one published oration. While in Steinfurt, Timpler presided over numerous published disputations; he also published his textbooks on metaphysics (1604ff), general physics (1605ff), “inanimate” physics (Apsychologia) (1605ff), “animate” physics (empsychologia) (1607ff), ethics (1608ff), family life (oeconomica) (1610ff), politics (1611), logic (1612), rhetoric (1613), and optics and human physiognomy (1617). From 1606 onward, imprints of his textbook on metaphysics also included his short treatise on liberal arts (technologia). His collection of philosophical exercises was published in 1618.

Heritage and Rupture with the Tradition

Timpler profusely cites authorities throughout his published writings. Among ancient authorities, Aristotle and Sacred Scripture are the most often cited. Frequently cited are Cicero, Plato, Quintilian, Seneca, and Plutarch (in that order). Thomas Aquinas and Augustine of Hippo are the most cited medieval authors. The most frequently cited post-medieval authors overall are Bartholomaeus Keckermann, Jacob Zabarella, and Francis Suarez, in that order. In his textbooks on metaphysics, logic, and politics, the single most cited authors are Suarez (metaphysics), Petrus Ramus (logic), and Jean Bodin (politics), respectively.

However, Timpler appears to have arrived at his own viewpoints independently. When citing the writings of individual authors (e.g., Aristotle and Petrus Ramus), he agreed or disagreed with each individual author concerning a given individual point of doctrine that was being examined.

In the case of Ramus, Timpler disagreed with his individual viewpoints more often than not. In the case of Aristotle, Timpler might (in the course of discussing any given point of doctrine) cite individual passages of Aristotle in support of a given viewpoint and also other individual passages of Aristotle against that same given viewpoint.

Innovative and Original Aspects

Timpler's views concerning the subject matter of metaphysics – All that is Intelligible – provide the context for much of his innovation and originality. All that is Intelligible is divided into something (aliquid) and nothing (nihil). Something is either positive something or negative something (privation). Positive something is either essence (essentia) or entity (ens). All that is Intelligible comprises being (est) and non-being (non-est). This distinction lies at the core of the principle of contradiction, thereby linking logic and metaphysics. Timpler briefly mentions quiddity (“being”) in his textbook on logic.

Timpler also set himself apart from his academic contemporaries with his view that there are three souls in man. Also apparently novel was his distinction between moral good (a subcategory of absolute goodness) and morality (a subcategory of respective goodness that was apparently also considered ontologically basic). Timpler apparently placed both of these two viewpoints within the contexts of (i) his concept of All that is Intelligible as well as (ii) his distinction between absolute and respective entities.

In his textbook on inanimate physics (apsychologia), Timpler also departed from normal practice in his time with his view that there are two elements (water and earth) instead of four. Also noteworthy was the strong emphasis that he placed on the advanced study of rhetoric. The interdisciplinary importance of the study of “tropes and allegory” (tropologia) is noted in his textbook on rhetoric. And in his short treatise on the liberal arts (technologia), he appears to have been the first author to discuss (in the year 1606) the concept of a “systematic textbook” (systema).

Impact and Legacy

Timpler's textbook on metaphysics had the greatest impact among his published writings.

A preface – and in later editions, commentary – by Rudolph Goclenius the elder (1547–1628) may have contributed to this. Very controversial was Timpler's view that All that is Intelligible (omne intelligibile) – and not entity (ens) – is subject matter of metaphysics. His view was rejected – or simply not adopted – by virtually all of his contemporaries. However, the phrase All that is Intelligible was then utilized – beginning no later than the year 1631 – as the subject matter of gnostologia. Gnostologia served as an umbrella concept for the study of all academic disciplines, including metaphysics.

The term ontology (ontologia) was apparently first used by Jacob Lorhard in a treatise, the *Ogdoas Scholastica*, that was published in the year 1606. Timpler does not refer to ontology in his writings. However, in his *Ogdoas Scholastica*, Lorhard virtually copied basic components of Timpler's textbook on metaphysics.

The last known imprint of any of Timpler's writings appeared in the year 1625. His writings continued to be cited in academic writings (with gradually decreasing frequency) until the early eighteenth century. Although Timpler's writings did not continue to be utilized as long as the writings by some of his contemporaries – for example, Bartholomaeus Keckermann – the view can be advanced that Timpler's originality and his logical ability were exceptional.

Tiraqueau, André

Born: 1488, Fontenay-le-Comte

Died: 1558, Paris

Xavier Prévost

Faculté de droit et science politique, Université de Bordeaux, Pessac, Cedex, France

Abstract

André Tiraqueau was a French jurist of the sixteenth century, who was notably a counselor of the Parisian Parliament. His works deal with many topics and concern both Roman law and Canon law but also French customs and judgments of the courts. His method applies humanist principles to the study of the law, without a complete break with the techniques of medieval jurisprudence.

Synonyms

[Andreas Tiraquellus](#)

Biography

André Tiraqueau was a French jurist of the sixteenth century born at Fontenay-le-Comte (Poitou) in 1488 and died at Paris in 1558 (Brejon [1937](#)). He certainly studied law at the University of Poitiers, which allowed him to become a judge in his hometown. In 1512, he married Marie Cailler, daughter of the “lieutenant criminel” (legal officer) of Fontenay-le-Comte. Then Tiraqueau became himself “lieutenant général.” He declined the office of counselor of the Parliament of Bordeaux, but became a counselor of the Parisian Parliament in 1541. There, he tied friendships with famous jurists, such as Charles Du Moulin, Michel de l’Hospital, and Christofle de Thou. The end of his career was notably marked by a trip to Rome in 1552–1553. Throughout his career, Tiraqueau published numerous law books.

Moreover, after his death in 1558, his son – who succeeded him in his office of counselor of the Parliament of Paris – brought out several unpublished writings.

The works of Tiraqueau are very various (Tiraqueau [1574](#)). They concern both Roman law and Canon law but also French customs and judgments of the courts. Besides, his books deal with many topics, such as matrimonial law (*De legibus connubialibus* [Tiraqueau [1546](#)]), property law (*De jure constituti possessorii*), nobility (*De nobilitate et jure primigeniorum*), succession law (*Le mort saisit le vif*), criminal law (*De pœnis temperandis* [Tiraqueau [1986](#)]), or also procedure (*De judicio in rebus exiguis ferendo*). These books made Tiraqueau famous among the jurists of the early modern period. They have been reprinted numerous times during the sixteenth and the seventeenth centuries. They have also led to disputes. For example, Tiraqueau quarreled with his friend, Amaury Bouchard, about the famed “querelle des femmes.” The *De legibus connubialibus* portrayed women in an unflattered way, which relegated them exclusively to domestic duties (Veillon [2001](#)). In response, Bouchard wrote in 1522 a genuine praise of women, entitled *Femineix sexus apologia*. Tiraqueau then fleshed out his argument over the numerous reissues, which indicate the spreading of his works.

This success is specially due to the method of André Tiraqueau (Rossi [2007](#)). He does not entirely break with the techniques of medieval jurisprudence. Consequently, although a humanist, Tiraqueau is sometimes considered one of the last French Bartolists. Thus, his commentaries borrow several features to the method of the Glossators and Commentators. He quotes about 100 medieval jurists, particularly Bartolus de Saxoferrato, Baldus de Ubaldis, and Panormitanus. The formal appearance of his treatises may be compared to those of some of his predecessors. Nevertheless, he divides from the medieval scholastic due to his extensive humanist culture. He tries to combine new ideas with traditional methods. So, his writings have both practical relevance and great erudition: not only legal, but also literary. He obviously uses many ancient

sources, both Greek and Latin. The influence of Erasmus is particularly noticeable, and he quotes numerous Italian humanists, notably Giovanni Pico della Mirandola. His literary scholarship constantly serves the study of legal sources.

The humanist culture of Tiraqueau flourished in “cénacle de Fontenay-le-Comte,” which grouped important figures of the time. For instance, there, he befriended Pierre Lamy, who certainly taught him Greek. Moreover, François Rabelais belonged to this famous circle. The books of Rabelais probably offer the best illustration of Tiraqueau’s fame and innovations. The character Trinquamelle is traditionally identified with the French jurist. Above all, Rabelais criticizes vehemently medieval jurisprudence, but he praises the method of legal humanism, then represented by André Tiraqueau. The influence of the jurist so significant that some passages of the *Third Book* of Rabelais are inspired by Tiraqueau’s writings (Perrat 1954).

Toletus, Franciscus

Born: 1532, Cordova (Spain)

Died: 14 September 1596, Rome

Simone Guidi

Sapienza Università di Roma, Rome, Italy

Abstract

A Spanish theologian, the first Jesuit cardinal. Known for his influential commentaries on Aristotle’s logic and physics. His *Commentaria* were widely used by the Jesuit schools, also influencing later works such as the famous commentaries by the Conimbricenses.

Biography

A Jesuit theologian and philosopher, born in Cordova (Spain) on 4 October 1532 and died in Rome on 14 September 1596. He studied philosophy in Valencia and theology in Salamanca, where he was a pupil of Domingo de Soto. There he later became a professor of philosophy. In 1558 he joined the Company of Jesus and was sent to Rome, where he taught as a philosophy professor at the Collegio Romano from 1559 to 1563. Later, from 1563 to 1569, he taught theology there. He received diplomatic postings and became, in 1593, the first cardinal in the history of the Jesuits.

Innovative Aspects

Influential as a theologian whose commentaries on Aristotle (Toletus 1561, 1572, 1573, 1574, 1575) were widely used by the Jesuit schools, also influencing later works such as the famous commentaries by the Conimbricenses, Toledo was one of the greatest sixteenth-century interpreters of the Stagirite and the Bible. He basically took Thomas Aquinas as his point of reference in his reading of Aristotle, often taking different

positions from Aquinas's and developing his own personal interpretations characterized by the eclecticism typical of his Order (Giacon 1947).

Logic and Theory of Knowledge

Among Toledo's important works are his commentaries on Aristotelian logic (Toledo 1572), by which the Spanish theologian contributed to a reworking of the so-called minor logic as well as theory of knowledge. Unlike Thomas, Toledo recognizes direct knowledge of the material singular in its individuality and thus held that the direct object of knowledge is not the thing in its generality but in its specificity. Taking the same position as Durando of San Porziano, the Cordovan cardinal denied the existence of an independently acting intellect and thus denied that any universal is produced by it in the spirit, as Cajetano had claimed (Hurter Stegmüller 1935). The acting intellect is however the same as the possible one: the act of abstraction is the operation of reaching beyond the incidental characteristics of things and considering substance in itself.

Metaphysics and Hylomorphism

Concerning metaphysics, Toledo accepted the analogical nature of thing-concepts but disagreed with Thomas's doctrines about the distinction between essence and existence (which he denied) and about the relationship between acts and potentialities, while recognizing three different forms of act: formal, entitative, and existential. As would be the case with Suárez and other Jesuit Aristotelians, Toledo did not believe that matter is only potentiality but that it exists in its own right, thus giving it the status of a complete substance. He also denied, therefore, that it is a principle of identification of the composite, as Thomas had held, since that role is taken on by form itself Hurter Echarri 1950. Matter, according to Toledo and according to Thomas before him, has a peculiar inclination to receive form, which is in a way indistinguishable from its very nature as matter (Des Chene 1996). According to Toledo, there are three kinds of "appetitus" that matter shows in relation to form: intellectual, sensory, and natural. The natural ones are those that are spontaneous tendencies shown by things (neither on a formal

nor on a material level) towards Good, assigned to them by God himself, and matter is in this sense proportioned for any form it may receive, though it has one already (Des Chene 2000).

Toledo's thought is also characterized by a probabilistic attitude to a wide range of issues: the distinction between the faculties and the soul is, he holds, only probable rather than real, as is the number of categories, which had been set by Aristotle at ten.

National and Kapodistrian University of Athens,
University of Athens, Panepistimiopolis,
Zografou, Greece

Abstract

Nikolaus Laonikus Tomaeus was a Greek Renaissance scholar who taught Aristotelian philosophy at Padua for almost 10 years. His lectures on Aristotle were extremely influential since he lectured on the Greek text instead of its Latin translation. He was highly accomplished in several fields, including art. His reputation among his fellow scholars, including Desiderius Erasmus, was high.

Synonyms

Tomeau, Leonik; Tomeo, Niccolò Leonico;
Tomeu, Nikollë Leonik

Biography

Nikolaus Laonikus Tomaeus was born in Northern Epirus, which nowadays belongs to Albania. He spent his life in Italy, where he studied and taught. After his studies at the University of Padua, he was appointed by the University to the position of Aristotelian philosophy (1497–1509), in an attempt of the University's authorities to

abandon the common Arabic interpretations and commentaries and teach the Greek original texts. In addition to Aristotelian philosophy, Tomaeus taught science (the Pseudo-*Mechanica* of Aristotle) and certain Platonic dialogues. From 1504 to 1506 he delivered lectures in Greek at the Cancellaria of San Marco. From 1521 until his death he taught privately in Padua.

Innovative and Original Aspects

Tomaeus' lectures at Padua were innovative since he chose to teach Aristotelian metaphysics with a Platonic blend. In addition, he used several sources in order to clarify Aristotle's texts, such as Thomas Aquinas, Averroes, and John Philoponus, despite the latter's harsh critique of key Aristotelian positions. He wrote a commentary on Alexander of Aphrodisias in which he defended the immortality of the individual human soul against several commentators of Aristotle. His lectures and works marked the shift of interest from the intellect to the immortality of the soul, an issue that monopolized the interest of scholars in Padua for decades. Tomaeus translated and commented on Aristotle's *Parva Naturalia* (1523), a work of crucial importance for the proper understanding and evaluation of Aristotelian natural philosophy. In his translation, he also included *De incessu animalium* and *De motu animalium*. Most sixteenth-century scholars approved his choice and his work became popular. Later Tomaeus started to translate and comment on Aristotle's *De partibus animalium*. In fact, he wished to complete the task that Pomponazzi left unfinished because of his death. Until his death, Tomaeus did not accomplish to finish the translation and the commentary, which would have completed his previous work on Aristotle. His nephew Magnus Leonikus found and published only a small part of his uncle's text. Tomaeus' texts are characterized by elegance, clarity, and philosophical precision. He did not follow the scholastic tradition, which was very strong in the Italian universities of his time. In addition, he promoted the ancient Greek commentaries and reproached the Arabic and Latin interpreters who failed to understand properly the meaning of Aristotle's

original texts. He attempted to reconstruct the original text of Plutarch's *Moralia* and translated the works of Pausanias, Ptolemy, Hippocrates, and Galen. He rendered into Latin Proclus's *In Parmenidem*. His seminal contribution was the translation of Pseudo-Mechanica.

Impact and Legacy

Among his students was presumably Nikolaus Copernicus Richard Pace, the influential professor at Cambridge University and secretary of King Henry VIII, and many other English noblemen, since the Venetian state ordered him to tutor the English students in Padua. Tomaeus enjoyed links with Erasmus and Erasmian circles. Erasmus expressed in various letters his respect for Tomaeus's personality and extraordinary scholarship.

Tomitano, Bernardino

Born: 1517, Padua

Died: 1576, Padua

Maria Teresa Girardi

Facoltà di Scienze Linguistiche e Letterature Straniere, Catholic University of Sacred Heart, Milan, Italy

Abstract

Philosopher, physician, and humanist, Bernardino Tomitano became a doctor *in artibus et medicina* at the University of Padua, where he was a professor of logic from 1539 to 1563. Tomitano was one of the greatest representatives of humanistic Aristotelianism, which was affirmed in the Paduan school in the middle of the sixteenth century. His work was an important link between the speculation of the beginning of the 1500s and the more mature and systematic work of his famous disciple Jacopo Zabarella. His teaching was characterized by the choice of reading Aristotle in the original Greek with philological expertise, the preference reserved for ancient Greek commentators and modern humanists, and the frequent recourse to Plato's authority. Tomitano's contribution to logical thought consisted in the centrality of the questions of method, in the theory of *regressus* as a fundamental logical tool for progressing in the knowledge of natural facts, in the instrumental conception of logic, and in the definition of

sermocinal arts (grammar, rhetoric, poetics) as logical arts.

From his participation in the *Accademia degli Infiammati* of Padua, in the first part of 1540, the rhetorical and linguistic treatise *Ragionamenti della lingua toscana* originated, which was extended in 1570 into the *Quattro libri della lingua thoscana*, in which the main interlocutor was his master Sperone Speroni. The work was intended to promote oratory prose and “high” genre writing in Italian in general and gathered together several issues concerning the arts of the word in an organic synthesis that had at its core the theme of the relationship between philosophy and eloquence.

Biography

Born in Padua, Tomitano started his regular education at Padua University at the age of 13: he studied logic with Marcantonio Zimara, philosophy with Marcantonio Genua, and medicine with Francesco Frigimelica and Ludovico Carensio (the Tosetto). Great physicians and humanists active in Padua at the time, such as Girolamo Fracastoro and, years after, Giovanni Battista da Monte, contributed to his medical formation. In July 1538, he became a Doctor *in artibus*, receiving the title from Genua and being promoted by the eminent Paduan Sperone Speroni, with whom Tomitano maintained a lifelong affective bond. Soon after, he became a Doctor *in medicina* as well. The year after his degree, Tomitano received the office of lecturer of the Aristotelian *Organon* at the University, and in 1543 he was promoted to the First Chair of Logic. He retained this Chair until 1563, when he renounced it, probably because he was disappointed at not having been offered the Chair of Natural Philosophy, which had been vacant after the death of his old master, Genua. Jacopo Zabarella then became the Chair of Logic in 1564. The teaching publications of Tomitano were the *Introductio ad Sophisticos Elenchos Aristotelis*, published in 1544 (Tomitano 1544), and a more significant comment on Aristotelic logic, the *Animadversiones in*

Primum Librum Posteriorum Resolutoriorum. Contradictionum Solutiones [...], comprising notes from his lectures and gathered in the 1562 Venetian edition of Aristotle’s work (Tomitano 1562). There was also a remarkable *corpus* of lectures, still handwritten, consisting of both *reportationes* of his students and his own preparatory notes.

His main commitment as a teacher and scholar of the Aristotelic *Organon* did not prevent him from cultivating his humanistic interests, mainly rhetorical and poetical, that originated in his youth while attending Pietro Bembo’s house, and flourished under his friendships with scholars and educated fellow citizens, such as Speroni and the Venetians. Tomitano thus appeared among the most active members of the Academies that were created in Padua during that century, from the *Accademia degli Infiammati* (1540–1542) to the *Elevati*, *Eterei*, and *Animosi*. The linguistic–rhetorical treatise, *Ragionamenti della lingua Toscana*, dated back to his participation in the most important one, the *Accademia degli Infiammati*; it was published in 1545 and 1546 and then again revised and vastly expanded in 1570, with the title *Quattro libri della lingua thoscana* (Tomitano 1545/1546, 1570, 1984). In 1550, he wrote a very interesting letter, in *volgare*, to Francesco Longo, a young Venetian nobleman, which was a short treatise on pedagogical principles (Tomitano 1820). In the meantime, he dedicated himself both to Tuscan lyric, writing rhymes in the Petrarchan style, and to Latin poetry, becoming an epic poet and apologist of the Venetian Republic and achieving considerable artistic results.

Starting in 1547, Tomitano abandoned his poetical engagement in favor of an increasingly intense practice of medicine, for which he became renowned both in Padua and in Venice. Venetian magistrates, for example, turned to him for expert advice on the outbreak of plague in Venice in 1556: his *Consiglio sopra la peste di Venezia* was published the same year and in 1567 a demanding work on syphilis, *De morbo gallico*, followed.

In 1555, Tomitano was put on trial before the Venetian Inquisition because of his translation of

Erasmus's *Parafrasi* on Matthew's Gospel, printed in 1547. He successfully defended himself with two orations addressing *Alli Signori della santissima Inquisitione*. Together with a celebratory speech, he pronounced in 1554 in favor of the election of the doge of Venetia, Marcantonio Trevisan, and provided a *Prefazione* to the first book of the *Prediche* of the popular Franciscan preacher, Cornelio Musso. Written in the same year, these two court orations bore witness to Tomitano's engagement on the side of eloquence, both sacred and profane, and in rhetoric in general. He had already shown engagement and interest as a theoretical arrangement in his *Ragionamenti della lingua Toscana*, which then deepened in the later *Quattro libri*. Oratory declamation was mixed with historical narration and with the biographical and historiographical work to which Tomitano dedicated his years: an almost completely unpublished life, in *volgare*, of the great *condottiero* Astorre Baglioni, who was killed in the battle of Famagosta in 1571.

In 1576, a new outbreak of plague spread in Veneto and this time Tomitano was unable to avoid the infection: he died of the plague in the same year.

Heritage and Break with Tradition

Both Tomitano and his work fitted perfectly into the Venetian and Paduan culture of the sixteenth century, characterized by the convergence of the Aristotelism professed in the prestigious university and the humanist tradition, whose influence had by then spread throughout the School and, outside it, was cultivated in the lively city academies that had reaped the benefits of Pietro Bembo's heritage.

This double character of the Paduan intellectual environment was evident first in Tomitano's philological teaching method, which was introduced by his master Genua, and was specific to the Paduan Aristotelians of the new generation, who had assimilated the humanist lesson together with the contribution that the knowledge of the Greek annotators of Aristotle brought to it. The first formulation of an instrumental concept of

logic was made by those annotators: updated by Marcantonio Zimara, this conception was adopted by Tomitano, who also assumed from his master a prevalently Averroist orientation in the interpretation of Aristotelian texts. In general, in the panorama of logical thought of the sixteenth century, Tomitano was acknowledged by scholars to be an important channel between the speculation of the beginning of the 1500s, still inspired by the fifteenth century, and the more mature and systematic one of Jacopo Zabarella and Francesco Piccolomini.

Tomitano also continued the Paduan school tradition in the field of medicine, as a follower of the Galenian method based on the union between reason and experience.

The systematic nature of academic work characterized the linguistics and rhetoric of Tomitano for which he was particularly indebted to Sperone Speroni, who was himself inspired on the one hand, by Pietro Pomponazzi's theories, and on the other, by Bembo's teachings. Tomitano acted in line with the contribution brought to the development of modern language and eloquence by the Paduan *Accademia degli Infiammati*.

Tomitano's work was characterized by some aspects of innovation and originality, rather than by an actual break with tradition.

Innovative and Original Aspects

The core of Tomitano's speculation is the methodological doctrine, addressing not only the logical structures in themselves but connected to them "in a whole that is Logic as the method of truth" ("in un tutto che è la Logica intesa come metodo della verità") (Riondato 1964, p. 69). In particular, it was the truth relative to the knowledge of nature, according to the main trend of the Paduan school and of Tomitano himself, to whom "lacked a specifically philosophical and metaphysical interest, that could overcome the problem of method [...] or that it could insert the problem of method into the same context of metaphysical questions" ("manco un interesse specificamente filosofico e metafisico, che oltrepassasse il problema del metodo [...] oppure che inserisse il

problema del metodo nel contesto stesso delle questioni metafisiche”) (Riondato 1964, p. 71).

In his juvenile *Introductio ad sophisticos elenchos Aristotelis* he had already devoted an entire chapter to the *de methodis* question, “the most challenging, on a doctrinal level, of the entire treatise, so much so to be judged by modern critics as a brief, but complete and original, treatment of the subject” (“il più impegnativo, sul piano dottrinale dell’intera operetta, tanto da venire giudicato da critici moderni come una breve, ma compiuta e originale trattazione dell’argomento”) (Davi 1995, p. 83). Here, he affirmed the supremacy (or primacy), among the Aristotelian ways of solving sophist deceits, of the method of division (*distinctio*) that deconstructed the genre into differences and was also useful for practical disciplines, such as medicine.

Mainly didactical and close to the linguistic–rhetorical interests of his, *Ragionamenti della lingua Toscana*, the work “focuses on the logic dealing with the forms of elocution, aiming to identify the figures and verbal artifices that make the discourse false and captious” (“verte su quella parte della logica che si occupa delle forme dell’elocuzione, allo scopo di individuare le figure e gli artifici verbali che rendono il discorso falso e capzioso”) (Davi 1995, p. 17). From Tomitano’s humanist sensitivity, at least two aspects of originality were derived both in the *Introductio* and, above all, in the more mature comment to the *Analitici*: the first was the philological cure reserved for Aristotle’s Greek text and the interpretative effort of controversial passages, and the second was the wide recourse to Plato’s authority, mainly in the methodological dialogues and in the *Animadversiones*, on the relation between science and opinion. In the *Quattro libri della lingua thoscana*, not only the tendency to conciliate Plato and Aristotle was frequent, but a reform of the Paduan study that might introduce Plato’s readings into the program was wished-for through the words of Speroni.

Tomitano’s contribution to the history of logic can be found in the published and unpublished commentary on *Analytica posteriora*.

First, the concept of logic as an instrumental faculty, necessary and applicable to all arts and

sciences, was expressed. Its sphere of relevance was the *intentiones secundae*, conceptual forms functional to the demonstrative syllogism that, interacting with the distinct but similar proceeding of the definition – such as Tomitano argued in his *Contradictionum solutiones* – led to knowledge and was, therefore, the goal of logic. The theory of demonstration constituted most of the comment, with particular attention paid to the resolute–compositive method in scientific procedure and, more importantly, identifying in the *regressus* (the method that ranged from the effects, the *nobis notiora*, to the causes, and thus to the conceptual structures, which, based on these, explained the data) the fundamental logic tool for progress in the knowledge of natural facts.

Treating human discretions, Tomitano located in the *ratio* (or *cogitatio*), intended as the ability to argue, the peculiarity of the human being. On this basis, he considered the various arrangements of the arts, and in line with the trend of the Paduan school and the intellectual philosophers of the *Accademia degli Infiammati* (Sperone Speroni, Benedetto Varchi, Alessandro Piccolomini), he proposed placing grammar, rhetoric, and poetics (Averroè’s *artes sermocinales*) together with logic among rational disciplines, all with discourse as their objective. In this regard, along with other Aristotelian humanists, he distinguished between the logic of truth and science and the logic of plausibility and opinion: the first is typical of the philosophical knowledge whose objectives were absolute, immutable, and necessary laws and the second is pertinent to the rhetorical discourse that, regarding the changeable, contingent, and plausible sphere of morals and politics, did not require demonstrative procedures, but tools of persuasion. In social life and civil community, the primacy, therefore, belonged to the rhetoric.

These are the conceptual requirements at the basis of the *Ragionamenti*, then the *Quattro libri della lingua thoscana*, the treatise in the form of a dialogue that offers an account of the conversations that occurred among a large group of members of the Academies, students of the University of Padua, and Sperone Speroni in the aftermath of his election, in November 1541, as *principe*

of the *Accademia degli Infiammati*. The main interlocutor was Speroni himself, who led the discussion on the trace of the ideas already expressed in his dialogues, especially in *Delle lingue* and *Della retorica*, inspired by the thoughts of Pietro Pomponazzi.

The main theme of the first part was the relationship between philosophy and rhetoric, which defined their respective spaces and specificities, but showed how the former was necessary to the orator – and to the poet – who wanted to be perfect. The strength of science could indeed help the weakness of opinion, and the certainty of absolute and immutable concepts could approach the probable to push the probable toward the truth: the speaker who, in addition to strong dialectical tools, ethics, and politics, was familiar with speculative knowledge, was the author of eloquent speech, able to decline philosophical truths in the human and civil group. Founded on the indisputable primacy of speculation, Tomitano's intent was to protect the cognitive and veritative dignity of the *artes sermocinales*, distancing himself from the actual thought of Speroni who, skeptical about the ability even of contemplative disciplines to fully draw from the truth, pushed the rhetoric toward sophistry.

But the innovative value of Tomitano's rethinking of the Ciceronian binomial "wisdom and eloquence" mainly lay in the fact that it concerned the modern eloquence in the vernacular. The greatness and dignified utility of oratory increasingly practiced through writing in the free Venetian Republic testified to how it was by then capable of matching the quality of the Latin oratory. Consistent with the thought of Speroni and of the *Infiammati*, Tomitano recognized the suitability of the vernacular for becoming the language of culture and extending its use to the "high" genres of oratory, philosophy, and sciences. For this reason, he considered it necessary to provide it with adequate rhetoric and linguistic rules, and in the second part of the *Ragionamenti-Quattro libri*, he dealt with the relationship between Latin and *Volgare*, the "*questione della lingua*" and imitation, styles, the nature and function of literary writing, especially oratory prose,

its rules for rhetoric and elocution, among which his observations on the rhythm of prose stood out for their originality. In light of the cultural Paduan avant-gardes, Tomitano rethought the teachings of the great classics and Bembo, in an attempt to arrange them in a *summa*, almost a modern *De oratore*, that could shape the "perfect form or idea of the good Italian writer" ("perfetta forma overo idea del buon scrittore italiano") (Tomitano 1545/1546, p. 5, 1570, f. 2r).

Impact and Legacy

Tomitano's work enjoyed great appreciation among his contemporaries, above all in the field of logic. His legacy was collected and brought to maturity by Jacopo Zabarella, who developed the theory of *regressus*, in which, with due caution, a connection with the Galilean methodology could be recognized. Zabarella himself definitively classified rhetoric and poetics as logical arts, with major consequences for the definition of the relationship between sciences and arts in the culture between the sixteenth and seventeenth centuries.

The reflection contained in the *Ragionamenti-Quattro libri* was harshly criticized by his Florentine contemporaries, and yet, it not only favored renewed and necessary attention for the rhetorical-linguistic needs of Italian prose but, focusing on the problem of the specificity of languages and disciplines, helped to set off along that path of specialization of knowledge that would become established in the following century.

Abstract

Aristotle's *Topica* provided a system of logical schemes (*topoi*) for constructing a consistent dialectical syllogism with plausible premises. In the fifteenth century, the Aristotelian theory of topics merged with the rhetorical practice of invention (*inventio*) and became a rhetorical means for finding probable arguments. The humanists' new interest in topics as an inventive dialectic was opposed to the metaphysical constructions and logical formalism of medieval philosophy. In Lorenzo Valla's work, dialectic took the form of an art of

discourse (*ars sermocinlis*) attentive to the needs of usual speech. By refusing every meta-physical assumption of Aristotelian logic, humanist dialectic became a simple instrument with a pragmatic and regulative function.

It was in this context that the conception of topics radically changed: *topoi* (*loci*) went from being an empty grid to becoming labeled containers which allowed for the quick recovery of all useful arguments about any subject (Rudolph Agricola). Humanists considered the *loci* as common elements (*capita communia*) of things and attributed to them the role of effective didactic-mnemonic support, leading the cognitive process. Thanks to these features, *loci* progressively structured themselves as a real alternative and complementary method to the syllogistic-demonstrative procedure. From the second half of the sixteenth century, this methodological function of topics went beyond the usual boundaries of rhetorical usage and came to embrace moral, theological, and natural investigation (Philipp Melanchthon, Petrus Ramus, Francis Bacon).

Heritage and Rupture with Tradition

In his *Topica*, Aristotle (1989) defined *topoi* as logical schemes that originate in opinion-based elements (*endoxa*) and prevent any contradiction of the thesis supported during an argument (100a). According to Aristotle, *topoi* are a list of inferential processes through which it is possible to prove a thesis and to disclose the inconsistencies of a line of reasoning. This system of *topoi* had a solid foundation in Aristotelian ontology, although it operated in the field of probable (dialectic): the inferential schemes worked through the use of categories and predicables, which were at the same time logical and ontological concepts. From this point of view, Aristotle's dialectical syllogism, based on *topoi*, assumed the constructive function of a means to reach the first principles of any science.

In rhetorical practice, the use of *topoi* diverged from the dialectical model. In his *Rhetoric*,

Aristotle turned the logical and formal structure of the dialectical *topoi* into a means to find persuasive arguments (*pithana*) in a civic context. The rhetorical *topoi* (specific or common) became collection places for quickly locating the most effective argument during a public speech. It is in this last sense that the Latin rhetorical tradition interpreted the word *topoi* (*loci*) and the dialectical topics became one of the five parts of the rhetorical art, i.e., invention (*inventio*). This particular way of reading Aristotle's topics – by reducing their logical meaning – had its origin in Cicero's work (Cicero 1942, 1949, 1954). In his *De oratore*, Cicero defined the *loci* as *sedes et quasi domicilia omnium argumentorum* (II,39,62): they functioned as markings, facilitating the search for arguments that were useful in ensuring the success of judicial, deliberative, and epideictic speeches. Moreover, Cicero explicitly contrasted dialectical topics with rhetorical ones: the first was helpful only to judge the consistency of an argument (*ratio iudicandi*) through formal confutation; the second produced the conditions for finding appropriate, effective, and convenient things to say (*ratio inveniendi*) in a public discussion (*De oratore* II, 38, 157–161; *Topica* 6–7). Against this backdrop, topics assumed an exclusively instrumental function: the system of *loci* was a storage room that collected and ordered all known forms of argumentation through labels. This *a posteriori* collection of *loci* made the use of arguments easier, but the ability of the true orator depended on his talent and diligence, which allowed him to extemporize by creating new arguments or carrying them out in relation to the occasion (*De oratore* II, 35, 147–151; Quintilian 2002, V, 10, 102–125).

After his translation and commentary on Aristotle's *Topica* and on Cicero's *Topica*, Boethius (477–524 AD), in his *De differentiis topicis* (Boethius 1978), tried to unify these two distinct traditions by comparing Themistius' Aristotelian topics with Cicero's rhetorical *loci*. He proved that the rhetorical *loci* had their origin in dialectical *loci* and reduced the whole rhetoric to a section of dialectic. Moreover, he transformed the *loci* into maximal propositions (*maximae propositiones*), i.e., unprovable axioms and principles of

demonstrations. In so doing, he removed the topics – and the whole dialectic – from the field of the probable (*endoxa*) and placed them in the field of apodixis.

From this point of view, Boethius led the way in the medieval identification of logic, dialectic, and ontology (metaphysics). This was also made possible by his commentary on Porphyry's *Isagoge*, which turned the concepts of Aristotelian dialectic (genus, species, specific difference) into a Platonic tree of being. This process deprived the topics of the specific feature of dealing with probable and plausible arguments.

From Petrarch (1304–1374) onward, humanists harshly criticized this identification of dialectic, logic, and metaphysics. They refused any Scholastic degeneration of this identification which had led to the consideration of formalism in logical discussions as the only object of philosophy (*logica modernorum*). The rediscovery of classical rhetorical sources (Cicero and Quintilian) and the non-mediated and critical rereading of Aristotle's works allowed the humanists to recover the concept of dialectic as *ars inveniendi*, strictly linked to the rhetorical practice. This process promoted the humanistic reappraisal of topics as a tool for producing an effective and persuasive speech, as a means to reform the educational system and facilitate learning and, progressively, as a method to arrange disciplines and acquire new knowledge.

Innovative and Original Aspects

The new humanistic interest in topics was therefore born as an attempt to overcome the abstractions and technical language of the fourteenth-century logicians. The roots of this attempt can be traced to the original humanistic conception of language as a rhetorical tool capable of adapting to the communicative needs of mankind (Vasoli 1968). Against this backdrop, humanists entirely renovated the *curriculum* of medieval studies: grammar and rhetoric were no longer exclusively preparatory disciplines, and they represented essential points of access to, and the culmination of, all knowledge. At the

same time, dialectic broke every link with metaphysics and regained the rhetorical meaning of *ars bene disserendi*.

The radical deconstruction of the logical-dialectical tradition and its metaphysical assumptions carried out by Lorenzo Valla in his *Dialecticae disputationes* (1444) played a key role in this process. Valla revealed the inconsistency of most of the concepts used by Aristotle and his commentators in establishing the rules of dialectical reasoning. This was achieved through coherent grammatical criticism and recurring reference to linguistic *usus* and *consuetudo* (Nauta 2009). Valla aimed to reduce dialectic to a few essential principles by reducing the number of transcendentals and categories (book I) and simplifying the structure of proposition (book II) and syllogism (book III). In so doing he proved that dialectic represented the less demanding part of rhetoric (Valla 2011, II, 2–7): it was a very small part of the *inventio*, i.e., only one of the five parts of rhetoric (*inventio, dispositio, elocutio, memoria, actio*).

According to Valla, the multiple rhetorical forms of argumentation were opposed to the inflexibility of the dialectician's unique argumentative instrument, i.e., the syllogism (Mack 1993, 84–85). The necessity of dialectical inferential processes was likewise opposed to the different degrees of probability in rhetorical ones. According to Valla's observations, therefore, the field of dialectic reasoning shifted from an apophantic to a semantic form of discourse (Vasoli 1968, 65). In line with this perspective, the *Dialecticae disputationes* included a discussion of *loci* – drawn from Quintilian's *Institutio oratoria* – as practical, auxiliary, and a-systematic tools.

Far from the radicalism of Valla, George of Trebizond showed a similar propensity for mixing dialectical and rhetorical forms. In his *Rhetoricorum libri V* (1433), he argued for the usefulness of *loci* as concrete supports for the invention of arguments. He combined this interest in *loci* with a significant insistence on the plurality of possible forms of argumentation by recovering the ideas of the Greek rhetorician Hermogenes (George of Trebizond 1547, 173–197).

In his *Dialectica* (1440), he included a section devoted to the rhetorical form of enthymeme together with an extensive discussion of *loci*, a deep knowledge of which enabled the achievement of *copia inveniendi* and clarity and speed of exposition.

With Rudolph Agricola's *De inventione dialectica libri tres* (1479), the ordering and guiding function of the topics took on an explicitly methodical role (Agricola 1539). Like George of Trebizond, Agricola was closer than Valla to the tradition of Aristotelian dialectic, but he showed a significant lack of interest in the ontological and metaphysical aspects related to logic. Trained in close contact with the Italian humanistic environment, his goal was to reform and rationalize the educational system and contemporary forms of learning and teaching. His purpose was to remove the unnecessary logical complications of late Scholasticism through the reestablishment of a simple and effective dialectical tool based on direct contact with linguistic habits and able to provide principles for clear and coherent teaching. Agricola, like Cicero, gave precedence to the first of the two parts of dialectic, i.e., *inventio* and *iudicium*. The development of a new system of *loci* to guide the *inventio argumentorum* was at the core of his reform of dialectic, which he described as *dux et directrix omnium artium* and the principal instrument of *docere*. His topical architecture had a radically innovative function: it represented an attempt to collect and order everything that is known or can be said about a thing – all the infinite multitude of its qualities – with *capita communia* able to grasp the *habitudines rerum*. According to Agricola, these labels (*capita communia*) formed a real grid through which to conduct things. This grid was useful both in investigating the nature of a thing in all its aspects and in comparing distant things to find the argument – the Aristotelian middle term – which links them. Against this backdrop, the *loci*, more similar to an *inventio*-oriented rhetorical collection than to the Aristotelian principles of inference, recovered a methodological function: they brought order to knowledge and provided a set of rules for comparing apparently unrelated things. Agricola made

an unprecedented effort to precisely define the relationships between different *loci* and their operating models. He made of the *loci* a sort of temporary and polyvalent set of filters to help understand things and their way of relating to each other (Mack 1993, 130–167).

According to Agricola, this new methodical and inventive dialectic occupied not only the whole space of the *inventio* and *dispositio* and the related function of *docere* but also a large part of the functions of *movere*. Contrary to Valla, who had marginalized dialectic and incorporated it into rhetoric, Agricola restored the primacy of dialectic and reduced rhetoric to the sole function of *delectare* (*elocutio*). Dialectic with its topical structure became a means of organizing knowledge and a rule for how to transmit it, an aid to reading and interpreting classical texts, and a norm of speaking *probabiliter*.

Agricola's *De inventione dialectica*, published for the first time in Agricola (1515), had a fundamental influence on the discussion of topics and methods that involved the sixteenth-century greatest humanists (Mack 1993, 257–302). Its numerous editions, commentaries, and epitomes rapidly spread across Europe (see the works of Alexander Hegius, Johannes Caesarius, Bartholomeus Latomus, Matthaeus Phrissemius, and Alardus).

The Spanish humanist Juan Luis Vives (1492–1540) was an attentive reader of Agricola's work where his pedagogical interest found support. In the 21 books of his *De disciplinis* (1531), he tried to restructure the set of disciplines and the way to transmit them (Del Nero 1991). Like Agricola, he was convinced that pedagogical reform needed to reconsider dialectic as a practical instrument in the organization of experience into an easily accessible and communicable system of knowledge. This process was grounded in a forceful criticism of Aristotelian logic and a rejection of the classificatory nature of its *topoi* which were disconnected from the pragmatic needs of everyday speech.

In the section of his treatise explicitly devoted to topics (*De instrumentum probabilitatis*), Vives aimed to strictly connect logical processes with psychological ones; i.e., the structure of *inventio*

and *loci* with the real mental operations of each cognitive act (Vasoli 1968, 226–227). According to Vives, the *loci* were no longer just the domiciles of possible arguments. They became the means through which reason attempted to interrogate the various objects of experience and establish relationships between them.

During the sixteenth century, this interest in the relationship between the system of *loci* and the *modus operandi* of reason led to an overlap between *loci argumentorum* and *loci memoriae*: the *loci* of the *inventio*, which represented and systematized real gnoseological and psychological processes, were more and more often compared with the mnemotechnical method of collection, reactivation, and combination of concepts developed in rhetorical practice. This was the main reason for the explosion, from the fourth decade of the sixteenth century, of the attempts to give a graphic output to the different systems of organization of the *loci argumentorum* in order to make it easier to memorize and use them.

A certain interest in the educative outcomes of the connection between *loci argumentorum* and memory is evident in the work of the reformed theologian Philipp Melanchthon. From the *De dialectica libri quatuor* (1528) – with its many re-éditions – to *Erotemata dialecticae* (1547), he centered his observations on the pedagogical function of dialectic, defined as *ars, seu via recte, ordine et perspicue docendi* (Melanchthon 1846, 515). According to Melanchthon, the main focus of dialectic was to support the *inventio argumentorum* by developing a consistent system of *loci* (Meerhoff 2001). The function of these *loci* was to define the boundaries of any subject matter and identify its interrelations. Without this *methodus* – Melanchthon was the first to use this term in relation to dialectic (Vasoli 1968, 296–299) – strictly connected to the elaboration of *loci*, human reason was destined to get lost and be blinded by experience data. The *methodus* allowed for the placing of every object within a reference system, setting the conditions for it to be interrogated and understood. This via *brevis* and *compendium* helped improve the use of knowledge and establish a clear internal order, and it was easily represented as a map (*tabula*), which could catch the attention of learners and aid their memory (see

book IV of *De dialectica*). Through this *tabula*, the mind could conceive of the whole order of words and things and understand how to investigate them. The topical method and its *tabulae* worked like an anatomical procedure whereby the whole body is dissected into its smallest components and subsequently reassembled to be better understood.

Melanchthon also applied the topical method to the definition and rational exposition of the principles of reformed Christian theology (Melanchthon 1854). In so doing, he established an easily understandable and communicable doctrinal orthodoxy.

While Melanchthon developed his topical theory, Johannes Sturm wrote and perfected his *Partitionum dialecticarum libri duo* (first edition 1539; latest version 1571), a work that deeply influenced Melanchthon's observations. Sturm taught in Paris from 1529 to 1536 and was the first to diffuse Agricola's work among the Paris *milieu*. He tried to dissolve the metaphysical substance of dialectic by converting Aristotelian categories (*praedicamenta*) into common *loci* of invention. The adoption of this perspective allowed Melanchthon to reduce the parts of dialectic based on the logical-metaphysical premises of categories – i.e., division and definition – to the inventive function of topics.

Sturm's contribution was an essential component in the definition of the relationships between dialectic and *methodus*: by combining rhetorical (Hermogenes) and medical (Galen) sources, he developed a threefold method based on *analysis* (from simple notions to general conclusions), *synthesis* (from complex notions to simplex ones), and *diæresis* (division and definition). According to Sturm, this method – related to the *pars iudicialis* of dialectic – was distinct from the demonstrative process, but it was particularly suitable for teaching and investigation.

The most famous among Sturm's Parisian students was Petrus Ramus. He was an inflexible critic of Aristotelian logic and made an effort to return dialectic to its Platonic origin. According to Ramus, dialectic should be an instrument able to follow and streamline cognitive processes. It aimed to reflect the innate structures through which experience and reality are interpreted by reason. Ramus's refusal of Aristotelian formalism

no longer depended solely on the humanistic interest in linguistic *consuetudo* and concrete human habits. Rather, it was connected to the need for an investigative tool able to adhere to the real operating mode of reason and to trace the principles that allow reason to understand the order of things.

In Ramus' work (Ramus 1543, 1555) the recovery of Platonism along with its dichotomous procedures came side by side with an interest in Sturm's reflection on method. This led Ramus to quickly discuss topics and *inventio* and to focus on the definition of a theory of *iudicium*. Ramus was especially interested in a kind of *iudicium* based on division and definition instead of one which focused on the evaluation of the coherence of syllogism. According to Ramus, this *iudicium* – which he called *methodus* – allowed for the arrangement of notions into an organic system of knowledge plotted according to their natural order (Ong 1958; Bruyère 1984). This method could be defined as a general science that systematized and joined all the others sciences into an encyclopedic chain.

This Ramist conception of method became a fundamental tool in structuring the teaching of logic in Central European *gymnasia* (Hotson 2007) and produced a large number of encyclopedic experiments such as Christophe de Savigny's *Tableaux* (1587) and Johann Heinrich Alstad's *Encyclopaedia* (1630) (Angelini 2008).

Impact and Legacy

The humanistic transformation of dialectic and the resulting rejection of syllogism as a unique instrument for producing knowledge were very relevant to the seventeenth-century discussion of method, which moved from the field of logic to the field of natural sciences. During this process, the new humanistic interest in topics and *inventio* played a key role: it represented an attempt to transform dialectic into a flexible instrument, related to linguistic use and *consuetudo* and suitable for non-purely formalistic research. Humanistic reflection on topics produced not only a substantial reform of teaching methods but also a new concept of scientific knowledge, new methods of investigation, and a new need for

systematization. Specifically, it had an essential influence on the method of collection and classification developed by Francis Bacon and related to natural history (Jardine 1974).

From a practical point of view, starting from the second half of the sixteenth century, topics merged more and more often with the elaboration of collections of commonplaces, which were employed as schoolbooks and became the core of European education (Moss 1996).

Fredericksburg, USA

Abstract

Lorenzo Torrentino was a printer active in mid-sixteenth-century Florence in the service of

Duke Cosimo I De' Medici. Born in Gemert (Netherlands) sometime between 1498 and 1501, he moved from Northern to Southern Europe to pursue his career in the book trade. In the early 1530s, he opened a bookshop in Bologna together with his compatriot Arnoldus Arlenius. In 1547 Torrentino moved to Florence, where he was appointed ducal printer by Cosimo. In return for his service to the Duke of Florence, Torrentino was granted a series of privileges, listed in a detailed contract. He set up a printing house in Via del Garbo in Florence and worked alongside his colleague Arlenius and the polygraph Lodovico Domenichi.

During the period 1547–1563, Torrentino printed some 290 works in the fields of literature, philosophy, religion, law, and art. His most famous publications include Bernardo Segni's translations of Aristotle's works, Francesco Robortello's commentary on Aristotle's *Poetics* (1548), academic lectures on Dante and Petrarch by members of the Florentine Academy, Justinian's *Pandects* (1553), Francesco Guicciardini's *Historia d'Italia* (1561, 1562), and Giorgio Vasari's *Vite* (1550). In 1561, Torrentino was requested by Duke of Savoy Emmanuel Philibert to open a printing press in Mondovì to serve the recently founded local university. He died in Florence on 2 February 1563.

Alternate Names

Leenaerts van den Bleek, Laurens; Torrentinus, Laurentius

Biography

Lorenzo Torrentino, whose Flemish name was Laurens Leenaerts van den Bleek (Slits 1995, 7), was born in Gemert (Netherlands) sometime between 1498 and 1501. Not much is known about his education, although he probably attended humanist and playwright Georgius Macropedius's school in 's-Hertogenbosch.

Torrentino embarked on a career in the book trade, which led him to move from Northern

Europe (Antwerp) to the Center-South (Basel, Lyon, and Venice). From 1532–1533 he settled in Bologna, where he ran a bookselling business together with philosopher and Greek scholar Arnoldus Arlenius Peraxylus (born Arndt or Arnout van Eyndhouts). Torrentino and Arlenius imported Latin and Greek books printed in Lyon and Frankfurt and sold them throughout Italy and beyond. On 14 July 1543, he married Nicolosia de Amicis with whom he had three children. His first wife died in the early 1550s, and Torrentino remarried in September 1558 to Florentine Lucretia Albertinelli, with whom he had two sons.

Acting on the merchant Bartolomeo Gualterotti's recommendation, Duke Cosimo I De' Medici's secretary, the jurist Lelio Torelli, contacted Torrentino to offer him the position of ducal printer in Florence. Bernardo Giunti had earlier been approached to fill the role, but negotiations were unsuccessful. Cosimo finally opted for Torrentino because of his beautiful fonts, his valuable contacts in the European book trade (Simonetti 2005, 36–37), and his independence from Florence's intricate political and familiar scene (Perini 1981, 790).

A 12-year contract was signed on 5 April 1547. It consisted of a series of duties assumed by Torrentino in exchange for privileges granted by the Duke. Under the terms of the contract, Torrentino was expected to move to Florence to open a printing press with two presses, nine fonts, and all the necessary employees. Furthermore, Torrentino undertook to present the Duke the first copy of each new print, negotiate with the Duke the selling price of the books, print only previously approved books, and provide books to the universities of Florence and Pisa. The ducal printer was also given a specific task, aimed at increasing the international prestige of Cosimo: the printing of the Medicean codex of Justinian's *Pandects*. Carefully supervised by Torelli and his son Francesco, the printing took place in 1553 (Baldi 2010). The privileges granted to Torrentino include a rather vague monopoly on printing in the territory of the Duchy, a second monopoly on the import of French and German books (with the exception of law books), a prohibition on other printing presses importing books similar to Torrentino's, and a salary of 100 *scudi* a year (Ricci 2001, 105).

Torrentino established his printing house in Via del Garbo, in the suburb of Santa Croce, and hired his earlier business partner Arlenius and the polygraph Lodovico Domenichi for the editorial role and a number of agents, among whom was Pietro Perna (Nuovo 2013, 285–86), to attend the international fairs. The rate of Torrentino's print production, which amounts to some 290 works for the 1547–1563 period (Nuovo 2013, 232), was rather inconsistent and heavily affected by external factors (such as the size of the Tuscan book trade, shortages in paper supply, and the outbreak of war) and by the burden of the initial financial outlay establishing the business. After a promising initial phase, the rate of production decreased in the second half of the 1550s (Ricci 2001, 107–10; Richardson 1994, 128). Torrentino published mostly philosophical and literary titles, such as Bernardo Segni's translations of Aristotle's works (1549a, b, 1550, 1559), Francesco Robortello's commentary on Aristotle's *Poetics* (1548), and Pietro Bembo's *Prose* (1548, 1549). His close link with the Accademia Fiorentina resulted in the publication of the academic lectures on Dante and Petrarch by eminent members such as Lucio Oradini (1550), Annibale Rinuccini (1561), and Giovan Battista Gelli's (1548, 1549a, b, c, 1551, 1555). Torrentino also printed historiographical volumes, such as Paolo Giovio's *Historiarum sui temporis* (1550–1552) and Francesco Guicciardini's *Historia d'Italia* (1561, 1562) (Ricci 2001, 111–12), and the first edition of Giorgio Vasari's *Vite* (1550) (Richardson 1994, 133; Simonetti 2005, 49–89).

With the permission of Cosimo, in 1561 Torrentino accepted the proposal of Emmanuel Philibert, Duke of Savoy, to set up a printing press in Mondovì to provide books for its newly-established university (Duroselle Melish 2013). His death on 2 February 1563 in Florence prevented Torrentino himself from printing anything in Mondovì, but the business was taken over by his son Leonardo and Arlenius and continued under their management until Leonardo's death in 1566.

Impact and Legacy

Torrentino's press established an important precedent for future similar enterprises of printing

houses financially sponsored or favored by the state authority so as to foster the printing industry in specific settings (Nuovo 2013, 231–35).

More specifically, Torrentino's printing press was instrumental in supporting Duke Cosimo's political strategies. Torrentino committed to publishing the works of the Florentine Academy, closely monitored by Cosimo, whose main aim was to celebrate the splendor of Florentine language and literature. Furthermore, Torrentino's press fulfilled Cosimo's aim of providing wider public access to learning by using the vernacular language (Cochrane 1973, 85).

Died: 1658, Alcalá de Henares

Simone Guidi

Spaenza Università di Roma, Rome, Italy

Abstract

A Spanish poet and humanist. He owes what little fame he has had to his work *Spongia*, published in 1617 and now lost, in which he accused Lope de Vega of distance from Aristotle's precepts.

Synonyms

[Juan Pablo Ricci](#); [Petro de Torres Ramilae](#); [Trepus Ruitanus Lamiva](#)

Biography

A Spanish poet and humanist. Born of humble origins in Villarcayo in 1583. Died in Alcalá de Henares in 1658. He graduated from the University of Alcalá in 1613 and was ordained in that year. He was assigned to the church of Saints Justo and Pastor. His works, all lost, were often signed under the pseudonyms of Trepus Ruitanus Lamiva and Juan Pablo Ricci (Columbario, 1618).

Torres Rámila owes what little fame he has had to his *Spongia*, a work published in 1617 and now lost, in which he poured scorn on the works of Lope de Vega for their incompatibility with Aristotle's precepts (Entrambasaguas, 1967). It is known thanks to the reply, *Expostulatio Spongiae*, published (perhaps by Lope de Vega himself and

some of his friends, probably Francisco López de Aguilar or Juan de Fonseca y Figueroa) in 1618 under the pseudonym of Julio Columbario, which quotes some passages from *Spongia* (Conde Parrado, 2012). It is probable that *Expostulatio* damaged Torres Rámila's literary career, resulting in him being criticized and ridiculed by the literary community (Tubau, 2009, 2010).

Tragedy in Renaissance Literature

Sandra Clerc

Dipartimento di Italiano, University of Fribourg, Fribourg, Switzerland

Abstract

The Italian Renaissance reinvents modern dramatic theatre. In the second decade of the sixteenth century, tragedy first resurfaces in narrow philological circles. Playwrights and men of learning recover ancient texts and advance new theoretical considerations on a multitude of aspects pertaining to the genre – philological, literary, dramaturgical, architectonic, and more. During this phase, newly produced tragedies often remain private,

unpublished texts, read in front of small audiences and rarely represented on stage. They are structured following ancient examples, but written in Italian, and their experimental features reflect current debates on language, verses, and literary genres. The first generation of Renaissance tragic playwrights is connected to the cultural circle of the “Orti Oricellari” in Florence and includes authors such as Giangiorgio Trissino (1478–1550), Giovanni Rucellai (1475–1525), Alessandro Pazzi de’ Medici (1483–1530/31), Luigi Alamanni (1495–1556), and Ludovico Martelli (1500–1527/28). In their productions, they tackle different subjects or events from Roman or medieval history, or they draw from classical plays.

During a second phase, around 1540, a new dramaturgical model with distinctive features emerges from the examples of the past. From Florence and Rome, the epicenter of tragic creation moves to Ferrara, Padua, and Venice. These cities offer Renaissance playwrights, respectively, a court known for its interest in theatre since the late fifteenth century, one of the most renowned universities, and the printing industry’s capital. Playwrights of the era are educated and active philosophers, doctors, and men of letters, often with firsthand experience in theatrical productions, while at the same time contributing erudite texts to the debate about dramatic theory. Because of this background, these plays are, above all, oriented toward political and philosophical topics.

During a third phase, after 1570, tragicomedy and the pastoral genre replace tragedy in princely courts. Dramatic theatre endures within learned circles of academies and among the aristocracy in Venice, but its main subject shifts from politics to romance, albeit maintaining the previous oscillation between *pathos* and horror.

Heritage and Rupture with the Tradition

During the medieval period and among the early humanists, interest in tragic theatre is marginal.

After the rediscovery of the treatise *De architectura*, written by Latin architect Vitruvius in the first century BC (printed in Rome in 1486), a large portion of which is dedicated to the theatrical building, the representation of ancient plays – both in Latin or translated into Italian – becomes an appreciated form of entertainment in Roman academies and northern Italian courts, including that of Ferrara. Slowly, important men of letters try to write original plays, such as the Tuscan humanists Angelo Poliziano (1454–1494; *Favola di Orfeo*, ca. 1478–83) and Antonio Cammelli, also known as “Pistoia” (1436–1502; *Filostrato e Panfila*, 1499). These first attempts are followed by a short period of silence with respect to tragic theatre, filled with a more prominent cycle of original comedies. Comedy, thanks to the almost uninterrupted fortune of the Latin playwrights Terence and Plautus (and their expositors), offered a more ready-to-follow structure (Pieri 1989). On the contrary, tragedy had yet to find a theoretical base upon which writers could lean. For this reason, the rediscovery of Aristotle’s *Poetics* constituted a crucial factor in explaining the revival and fortune of classical tragedy during the Renaissance. In 1498, the humanist Giorgio Valla (1447–1500) published his Latin version of the treatise, and a few years later (in 1508), the Greek scholar Janus Lascaris (1445–1534) prepared the first Greek edition of the text for the “*Rhetores Graeci*” book series, published by the famous Venetian printer Aldus Manutius (1449/52–1515). The latter had previously edited the edition of the collected works of Sophocles (1502) and Euripides (1503) in the original Greek, and subsequently Euripides’ *Iphigenia in Aulides* and *Hecuba* (1506) with a Latin translation by Dutch humanist Erasmus of Rotterdam (1466–1536). For the first Greek edition of Aeschylus’ tragedies, the public had to wait until 1518. In 1524, the playwright and writer Alessandro Pazzi de’ Medici printed his Latin translation of the *Poetics*, and from that moment onward, philosophers and commentators – especially at the University of Padua – worked to explain the Aristotelian treatise (Ariani 1974; Cremante 1988). In 1548, the philosopher Francesco Robortello (1516–1567) published his

Explicationes in librum Aristotelis de arte poetica, the first integral commentary written on Pazzi's Latin version. Robortello took the idea that tragedy had to be both pleasurable and useful from the Latin poet Horace, author of the well-known treatise *De arte poetica*. In this way, Robortello blended together the Greek and Latin theoretical traditions influencing contemporary theatrical production. Two years later, Vincenzo Maggi (1498–1564), professor of philosophy in Padua and Ferrara, printed the commentary he wrote with his colleague Bartolomeo Lombardi (*Explanationes in Aristotelem de Poetica*, 1550), adding to Robortello's interpretation the fundamental idea that tragedy should provide a moral lesson, through *catharsis*, or purification from the passions. In the meantime, the Florentine historian Bernardo Segni (1504–58) published the first Italian translation of Aristotle's *Poetics* in 1549. From this moment onward, scholars and philosophers produced both critical interpretations of the ancient treatise and original works on the topic: Antonio Sebastiano Minturno (1500–1574), *L'Arte poetica*, 1554; Pier Vettori (1499–1585), *Commentarii*, 1560; Julius Caesar Scaliger (1484–1558), *Poetices libri septem*, 1561; Gian Giorgio Trissino, *Sei divisioni della Poetica*, 1564; Lodovico Castelvetro (1505–1571), *Poetica d'Aristotile vulgarizzata e sposta*, 1570; and Alessandro Piccolomini (1508–1578), *Annotazioni nel libro della Poetica*, 1575). For most of them, tragedy had a moral and educational purpose, but for others, the only aim of dramatic theatre was to evoke pleasant astonishment (*dilettevole meraviglia*) (Herrick 1946; Jossa 1996).

The framing of theoretical precepts was crucial for the reinvention of tragedy; however, translation also played a fundamental role in the development of this genre, to meet the increasing demand of the burgeoning print industry for new texts. This cultural and commercial endeavor reached its apex with the systematic effort of *volgarizzamenti*, promoted by Venetian and Tuscan printers. In this regard, the translation of Seneca's complete tragic works, completed in 1560 by the polygraph Lodovico Dolce (1508/10–1568), can be considered emblematic.

The attitude of Renaissance writers was reminiscent of the disciple trying to outdo the master. Since the beginning of the sixteenth century, the production of new tragedies complemented the efforts of translators. Nevertheless, playwrights had quite a limited range of possibilities. On the basis of Terentius' statement: "Nullum est iam dictum quod non sit dictum prius" (*Eunuchus*, v. 41) – *Nothing is said that hasn't been said before* – Renaissance writers usually removed the *inventio* (the finding of a subject) and thus reduced the first rhetorical steps to *dispositio* (the order in which the arguments are displayed to convey a message) and *elocutio* (the rhetorical embellishment). During the Renaissance, the latter was considered to be of the highest artistic virtue. Almost all plays were rewritten on the basis of archetypal texts (i.e., classical plays) even when they were not direct translations of existing literary works. Ultimately, only two generic plots directed the sequence of events in a tragedy. The first revolves around the struggle of a (usually) young woman fighting against the rules of men in defense of higher moral rights and the reasons in her heart – the Antigone type. The second presents a male character's futile resistance to the ruthlessness of Destiny – the Oedipus type (Jossa 1996; Gallo 2005).

Seneca was the first author (chronologically and in importance) to be taken as a model. Italian translations of some of his plays circulated in printed form from as early as 1497. Shortly afterward, with the rediscovery of Aristotle's *Poetics* and Greek plays, Euripides and Sophocles also became relevant in the work of Renaissance playwrights (Aeschylus' plays, on the contrary, were less popular and widespread at this time). In summary, both Latin and Greek models played an important role in the development of Renaissance tragedy, and their influence was visible throughout the sixteenth century and beyond.

Most of the philosophical problems tackled by playwrights in Renaissance tragedy originated in ancient theatre: the relationship with power (between kings, servants, counselors, or family members), good government, destiny and fortune, divine justice, and the human condition, among others. Because of the peculiar circumstances

surrounding the political and religious debate during this period, however, authors focused particularly on the moral aspects of tragedy as a means to condemn unethical rulers and sinners and at the same time to teach resilience and faith. The struggle against the passions, frequently represented as infernal presences, reached back to arguments about stoicism and Senecism, emphasizing the ideas of *frugalitas* (frugality) and *aurea mediocritas* (golden mean). Since Earth is the realm of sins and corruption, death becomes the means of freeing oneself from matter and errors, following the anagogic horizon of Platonic and Christian philosophy. This concept led to an irrevocable condemnation of earthly joys and fallacious happiness, originated from worldly values such as glory and power. Renaissance playwrights followed the Platonic legacy – mediated by Christian and Humanist philosophers such as Lactantius (ca. 250–317), Giovanni Pico (1463–1494), and Marsilio Ficino (1433–1499) – that revived the Pythagorean and Orphic concept of the body as the prison of the soul, which Plato, in turn, connected to the problems of the immortality of the spirit and the divine origin of the soul (Gallo 2005).

Another fundamental question frequently represented in Renaissance tragedy concerned divine justice or theodicy. Descending from the *Book of Job*, and common in the Greek and Latin traditions, the idea of (apparent) earthly injustice affects all human beings without discrimination. In tragic plays, Divine Providence guides all of mankind, but it works in its own ways and time, and – within Catholic theology – does not negate human free will. Evil is, ethically, a challenge that God gives to mankind, or, cosmically, an element that guarantees universal harmony. It is, in any case, unquestionably necessary.

Innovative and Original Aspects

The principal innovative aspect of Renaissance tragedy resides in the plays' structure. First introduced by Ferrarese playwright Giovan Battista Giraldi Cinthio (1504–1573) in his *Orbecche*

(1541), the division into five acts spaced out by choruses – a stylistic device derived from comedy – and the separation of the prologue from the action are widely accepted by subsequent playwrights. Giraldi dedicated a central position to moral teachings. To achieve his moral goals, Giraldi used horror and compassion. He did not hesitate, for example, to represent death on stage. He wrote his plays (three tragedies, six tragicomedies, a pastoral, and a comedy) not for armchair readers, but to be represented on stage, namely, before Ferrara's prestigious court. He was thus perfectly aware of performance needs and boundaries. Giraldi was also the first to enter into the theoretical debate on tragedy, mainly arguing against the alternative proposition of Sperone Speroni's *Canace* (1500–1588; 1542). The latter defended the primacy of rhetoric and style above the need for representation. And yet, the opposition between Giraldi and Speroni, which lasted almost 20 years, can be read as a more profound contrast between two traditions: the humanist erudition of Ferrara and the Aristotelian sophistication of Padua. The former preferred *inventio* over *elocutio* because the plot's originality allowed the public to be astonished, inducing *catharsis*. For Speroni, a professor in Padua, surprise originated, on the contrary, from the author's rhetorical ability to narrate old stories in different and new ways. Speroni and Giraldi were also representative of the two most common playwright typologies in the sixteenth century: those who operated inside a literary academy and those who write for a courtly public. Speroni was a prominent member of the "Accademia degli Infiammati," where he read aloud his only play little by little during the writing process (*Canace* was printed in 1547 but was never performed on stage because of the sudden death of its protagonist, Angelo Beolco "Ruzante"). This latter tradition contributed to the increased amount of *volgarizzamenti*, rewritings of ancient plays and plots inspired by historical events (ancient, medieval, or contemporary) or mythological narratives (Roaf 1982).

The plays of mid-sixteenth-century writers, such as Pietro Aretino (1492–1556) and some lesser-known talents, are often considered simple

literary exercises, but when read carefully, these tragedies offer various points of interest. To a large extent, the core ideas represented in these plays are the same as those discussed in renowned literary and philosophical works of the time: relationships and power, rules for good governance, and, of course, the personal struggle between effects and politics. This convergence might explain the great number of tragedies written in Italy during the sixteenth century – nearly 120. Tragic plays offered stylistic devices to express controversial ideas that would hardly have been approved if framed in a different genre. Through tragedies, artists were able to address the fears of their time in a veiled manner.

Impact and Legacy

Some playwrights were also actors, such as Luigi Groto, “the blind man from Adria” (1541–1585), who performed his plays on a permanent public stage in the City of Adria, in Polesine. Toward the end of the century, such actors’ performances became more prominent, posing considerable problems for the production of classical tragedy, which required a large monetary investment to be represented on stage. Furthermore, tragic playwrights generally used highly elaborate language. Tragedy is a preferred academic genre, but even in those circles, dramatic texts were more read than staged. Playwrights increasingly abandoned the characteristic structural innovations of Renaissance tragedy (prologue, five acts, horrific, and novelistic plots) to adapt plays for the newly emerging environment. The erection of the first permanent stage in Vicenza, the notable “Teatro Olimpico” by the architect Andrea Palladius (inaugurated in 1585 with an Italian version of Sophocles’ *Oedipus rex* by Orsatto Giustiniani), confirms the increasing importance accorded to staged representation. To this end, Venetian writer Angelo Ingegneri (1550–1613) dedicated his treatise *Della poesia rappresentativa e del modo di rappresentare le favole sceniche* (1598).

Toward the end of the century, theatre often represented more effects than ideas. A noticeable

exception was provided by the late Renaissance playwright, Torquato Tasso (1544–1595), who represented the arrival point of the sixteenth century’s tragic (and most broadly literary) trajectory. His artistic production style combined a poetic reflection based on Aristotle (*Discorsi dell’arte poetica*, written over an extended period of time – 1562–1587 – then becoming *Discorsi del poema eroico*, printed in 1587) with the writing of several literary works. Among them was an epic poem (*Gerusalemme liberata*, 1581); a tragicomedy, or pastoral (*Aminta*, 1573, which critics read as foreseeing melodrama); and a tragedy, *Il re Torrismondo* (1587). In this tragedy – dedicated to Vincenzo Gonzaga, who freed Tasso from imprisonment in the asylum of Sant’Anna – the author mixed two dramatic traditions: the chivalric and courtly play, in which the main character was torn between love and honor (a plot derived from a historic source, *Historia de gentibus septentrionalibus* by Olaus Magnus), and classical tragedy based on incest (here, as in the model, *Oedipus rex* by Sophocles, the characters were unaware of their actions). Tasso’s example, however, did not save tragedy from an inevitable flagging of interest (Cremante 1988). Along with comedy, both public and writers increasingly preferred pastoral plays and tragicomedy, which foreshadowed the seventeenth-century blossoming of lyric theatre.

Transcendentals in the Renaissance

Thomas Jeschke

Faculty of Arts and Humanities, Thomas-Institut,
University of Cologne, Cologne, Germany

Abstract

The doctrine of transcendentals – a key doctrine of medieval metaphysics – is of minor interest to Renaissance philosophers. However, some of them pick up focal points of the doctrine and transform them according to the more “practical” approach, genuine to Renaissance philosophy. Lorenzo Valla, for instance, criticizes the doctrine from a linguistic perspective. Giovanni Pico della Mirandola, on the other hand, develops it further into a doctrine with ethical impact. The traditional approach, however, is further advanced in late medieval schools, from where it entered early modern discussions.

Heritage and Rupture with the Tradition

While the notion of transcendentals was an important feature of medieval philosophy (cf., e.g., Aertsen 2012) and made its way via the

so-called Second Scholasticism into early modern philosophy, the doctrine was not so pivotal to Renaissance thought. This is first due to the Renaissance philosophers’ more general opposition against scholastic philosophy and second to a shift from a theoretical, i.e., mostly metaphysical and ontological, perspective to a more “useful,” i.e., practical, philosophy. However, there are some interesting remnants of medieval transcendental philosophy in Renaissance thought.

Innovative and Original Aspects

The medieval concept of transcendentals is far from being homogeneous. Moreover, it evolves from Philip the Chancellor (1225) to Francisco Suárez and the early modern period (see also Goris and Aertsen 2016). However, the account Thomas Aquinas gives – at least in *De veritate* 1, 1 – is not only “the most extensive one in the thirteenth century” (Aertsen in Federici Vescovini 2002, p. 139) but also a point of reference for Renaissance philosophy. Aquinas lists six transcendentals or common modes of being, namely, being (*ens*), thing (*res*), one (*unum*), something (*aliquid*), good (*bonum*), and true (*verum*) (Aquinas 1975, pp. 3–8). These modes are “transcategorical,” in the sense that they surpass the Aristotelian division of being into one substance and nine accidents. Every being, every existing thing possesses all of these modes. Hence, one can say that they are extensionally identical. Intentionally, however, they differ from each other. While “being” is the most fundamental notion, each of the last five transcendentals adds a different notion (*ratio*) to “being.” *Res* adds the notion that every being has an essence, and *unum* adds the notion that every being is undivided. *Aliquid* refers to the fact that every being has an essence that is separated from others. *Bonum* points to every being insofar as it is a possible object of the will, while *verum* considers it a possible object of the intellect. The first two notions refer to a being in itself, and the last three consider it in relation to other beings. The transcendentals *ens*, *unum*, *bonum*, and *verum* are already found

in Philip the Chancellor, while *res* and *aliquid* stem from the Arabic tradition, precisely from Avicenna (Sorge in Federici Vescovini 2002).

Lorenzo Valla explicitly picks up Aquinas's account in his *Retractatio totius dialecticae* (Valla 1981, vol. 1, p. 11; Aertsen 2012). He lists all six transcendentals of Aquinas in a slightly different order. Yet, he is displeased with such a multitude of principles, which he calls "kings" (*imperatores ac reges*), and pleads for one "king" or transcendental, while denying the other five a transcendental character. By applying a linguistic analysis, he arrives at the conclusion that *res* is the "king" and unique transcendental. Valla argues that all five transcendentals can be reduced to *res*: *aliquid* is some thing (*aliqua res*), *unum* is one thing (*una res*), etc. (Valla 1981, vol. 1, p. 12). So, the most fundamental notion is "thing" instead of *ens*, which itself can be reduced to "the thing that exists" (*ea res quae est*). Valla's "reworking" of the theory of transcendentals is due to a more general skepticism concerning dialectics in its Aristotelian-Scholastic form and regarding a metaphysical approach. Instead, he starts from the things insofar as they are known to us in our (ordinary) language.

We find another link to the theory of transcendentals in Giovanni Pico della Mirandola, with an interesting move toward moral philosophy, another particular feature of Renaissance philosophy (Aertsen 2012). In his *De ente et uno*, Pico ignores the "Arabic" transcendentals *aliquid* and *res* and concentrates on the four remaining ones (Pico 1993, p. 104). Moreover, he connects them with God's causality. Similar to God, who is the efficient, exemplary, and final cause, any existing thing comes from God (*ab ipso*; hence it is called "*ens*"), is created through Him (*per ipsum* and hence "*verum*"), and directed toward Him (*ad ipsum* and thus "*bonum*") (Pico 1993, pp. 120–126). If it is considered in itself, it is one thing (*unum*). In ch. 10, the ontological perspective is then changed into an ethical one (Pico 1993, pp. 130–134): the striving for unity, truth, and goodness becomes the means by which man assimilates himself with God. In this perspective, the transcendentals are, according to Pico, the way to beatitude and to a morally praiseworthy life.

Impact and Legacy

As mentioned earlier, the importance of the transcendentals decreases in Renaissance philosophy. Remote discussions are also found in Nicholas of Cusa (Turner in Federici Vescovini 2002; Federici Vescovini in Federici Vescovini 2002), Charles de Bovelles (Trottmann in Federici Vescovini 2002), Juan Luis Vives (1990, p. 133), John Maior (1514, pp. 5–6), Crisostomo Javelli (1547, pp. 1–53), and even in Philip Melanchthon (1846, col. 554). The doctrine flourished, however, in Second Scholasticism, especially in Suárez's account in his *Disputationes metaphysicae*. It was continued at the universities in Salamanca, Alcalá, and Coimbra, as well as at German universities, especially where an Aristotelian approach to philosophy was preferred. It thus entered the schoolbook tradition and found its way into (early) modern philosophy (see, e.g., Timpler, Wolff, and others) (Aertsen 2012, pp. 587–634; Darge 2004).

Translatio Studiorum

Simona Cohen

Department of Art History, Tel-Aviv University,
Tel-Aviv, Israel

Abstract

Translatio studiorum, literally the transfer of learning, refers to the transmission of knowledge from one place to another, one period to another, or/and from one intellectual context to another. It may also include the transfer of ideas and concepts from one medium to another, through material culture and the arts. Latin translations and commentaries from medieval Arabic became important mediators of Classical western knowledge, although some Renaissance humanists advocated the philosophical primacy of Greek, the language of scientific and philosophical classical scholarship. During the fifteenth century, Greek originals were rediscovered and revived and, by the mid-sixteenth century, both Greek and Latin texts were translated into native vernaculars and printed, thus reaching a larger public. Some recent scholars have claimed that the fundamental concern of *translatio studiorum* with literary

legacy has detracted from the contribution of material and artistic mediators. Furthermore, literature on *translatio studiorum* has generally promoted the assumption that human learning and cultural heritage originated in Greece and spread to the West, thereby ignoring mutual influences and interactions between the cultures and learning of East and West.

Transmission, Translation, and Innovation

Translatio studiorum literally means the transfer of learning or studies. It refers to the transmission of knowledge from one geographical place to another, from one period to another, or/and from one intellectual context to another. The concept implicitly conveys that the transmission of learning also carried with it the cultural ideals and values of intellectual heritage. The term has generally been described as a continuous transposition of texts and their rewriting, translations, and interpretations, but the limits of this definition have recently been debated. *Translatio studiorum* may also include the transfer of ideas and concepts from one medium to another, transfer by means other than texts, through material culture and the arts.

In classical Latin, *translatio* meant both *translation* and *transfer*. Later the Latin term *translatio* designated transmission, and *traductio* referred to what we call translation. The words *translation* in French and *traslazione* in Italian had a spatial sense, meaning the movement or displacement of a figure or object.

The concept is closely linked to *translatio imperii* (transfer of rule), a historical term originating in the Middle Ages, which described the movement of imperial dominance as a linear succession of transfers (Knauth, 2007). This idea of historical linearity was opposed by Petrarch (Francesco Petrarca, 1304–74), who is considered the initiator of the fourteenth century Renaissance or so-called proto-Renaissance, and by his humanist followers who perceived a new relationship to antiquity based on renovation or Renaissance.

Latin translations played a fundamental role in the transfer of learning and the philosophical acculturation of Europe. During the Middle Ages

and the early modern period, there was a general debate about the philosophical potential of Latin in its relationship to contemporary vernaculars and ancient languages, especially Greek, Hebrew, and Arabic (De Libera, 1997). Some Renaissance humanists advocated the philosophical primacy of Greek as opposed to scholastic Latin. Due to translinguistic and transcultural experiments in translations, primarily from Arabic and Hebrew, medieval Latin had developed a lexicon suited to philosophical discourse. Neo-Latin translations were produced in the fields of medicine, astrology-astronomy, and natural history (Giglioni, 2015). Classical sources of scientific and philosophical scholarship were in Greek but, since a few Renaissance literati could read them, Latin translations and commentaries from the Arabic became important mediators of ancient knowledge. Humanists produced Latin versions of the writings of Aristotle and Plato (4th c. BC), Archimedes (3rd c. BC), Dioscorides ((1st c.), Ptolemy (2nd c.), Galen (2nd c.), and others. The first complete Latin translation of Plato, by Marsilio Ficino (1433–99), was dedicated to the ruler of Florence, Lorenzo de' Medici, who had supplied him with the Greek manuscripts and was the patron of Ficino's *Accademia Platonica*. The translation of 1468/9 was published in 1484. Ficino also translated Hellenistic documents of the so-called *Corpus Hermeticus*, attributed to the mythical, primeval sage Hermes Trismegistus, and writings of Neoplatonists, including Plotinus. From the mid-fifteenth century, Greek originals were rediscovered and revived along with Greek scholarship (Worth-Stylianou, 1999). The work of Manuel Chrysoloras (ca.1350–1415), who came from Constantinople to teach Greek in Florence at the invitation of the humanist and historian Coluccio Salutati (1331–1406) was continued by Greek émigrés such as Cardinal Bessarion (1395–1472) and John Argyropoulos (1415–87) following the Fall of Constantinople in 1453. Prominent humanists, like Leonardo Bruni (1370–1444), Giovanni Pico della Mirandola (1463–94), and Angelo Poliziano (1454–94), translated works from Greek. Towards the mid-sixteenth century, Greek and Latin texts were translated into native vernaculars, primarily in Italy and France, in order to reach a broader

public. There was much opposition to literal, word-for-word translation during the fifteenth and sixteenth centuries. Although Ciceronian Latin was considered the ideal model, rigid *imitatio* was increasingly criticized. Salutati wrote “I must imitate antiquity not simply to reproduce it, but in order to produce something new.” In the sixteenth century, the eminent Dutch theologian and classical scholar Desiderius Erasmus (1466–1536) ridiculed as “apes” those humanists whose imitations of Cicero were superficial.

The traditional perception of the Renaissance, as a period of “rebirth” and innovation, characterized by the departure from medieval cultural legacy, originated with Petrarch and subsequent Italian theorists, and was promoted by the cultural historian Jacob Burckhardt (1818–97). Modern scholars, however, have recognized that humanism owed a considerable debt to medieval learning and translations of Greek and Arabic scientific and philosophical texts – the medieval Latin *translatio studiorum*. The eminent Andalusian philosopher Averroes (Ibn Rushd, 1126–1198) wrote commentaries and emendations of Aristotle, which were the foundation of the Aristotelian revival in the twelfth and thirteenth centuries and promoted Aristotelian studies in the West and in the Islamic world until the late Renaissance. Thus access to the writings of Aristotle and other classical authors came in part from Arabic translations and commentaries. One of the main centers of Averroistic-Aristotelian academic studies in Italy was established at the University of Padua. Separate editions of Aristotle and Averroes were published in nearby Venice in the 1470s, but the first humanist edition of Aristotle-Averroes combined dates from 1497, followed by sixteenth-century editions. Early patrons of the return to the Arabic authors, included the future cardinal Domenico Grimani (1461–1523) and Pico della Mirandola. The philosophical curriculum taught in Italian universities and promoted by humanists was reflected in contemporary paintings, such as *The Three Philosophers* by Giorgione (1509, Vienna), where a Jewish patriarch and Moslem sage symbolically represent the legacy of a Christian theologian, and *The School of Athens* (Vatican fresco, 1509–11), by Raphael, who painted Averroes among the Greek scholars. These stand in contrast to earlier fourteenth and

fifteenth-century paintings of *The Triumph of Saint Thomas Aquinas*, such as that by Benozzo Gozzoli (ca.1470–75, Louvre), where Averroes was shown trampled underfoot, illustrating the rejection of Arabic inheritance.

The Arabo-Judeo-Latin lineage was the basis for the Aristotelian corpus up to the mid-sixteenth century. The break came with the Venetian edition published by Thomas Junta in 1562 where the source was no longer Arabo-Latin, but Greek.

The concept of *translatio studii* has been fundamentally concerned with the translating, commenting, interpreting, and rewriting of texts. This concentration on literary studies has detracted from the contribution of material, and artistic mediators in cultural transmission, as some scholars have recently demonstrated (Flood, 2009).

From historical and geographical viewpoints, literature on *Translatio studiorum* has promoted the assumption that human learning and cultural heritage originated in Greece and spread to the West. Mutual influences between East and West and their continuous interactions in the transmission of culture and learning have largely been excluded from this discussion, due to the compartmentalization of scholarly research according to preconceived cultural, historical, and/or religious boundaries. One of the most widely diffused and translated literary compositions, illustrating east–west *Translatio studiorum*, is the collection of Indian animal fables called the *Panchatantra* (ca.3rd c.). The original Sanskrit version is lost, but the text and illustrations were transmitted, through revisions and translations, from India and Indonesia, through Islamic Asia, to medieval and Renaissance Europe, transcending religious, sociopolitical, cultural, and linguistic boundaries.

Abstract

An Aristotelian philosopher and a physician, Pietro Trapolino was a professor of *philosophia*

naturalis and medicine at the University of Padua. He studied at Padua under the Dominican Francesco Securo de Nardò and Nicoletto Vernia. He spent his teaching career there, where he was Pietro Pomponazzi's professor and later colleague and friend. His name is mostly linked with his commentaries on Aristotelian works (*Physica*, *De caelo*, *De anima*), in which he kept a moderate Averroism and showed a significant Thomistic inclination.

Alternate Names

Trapolino, Petrus

Biography

Pietro Trapolino was born in 1451 in Vigodarzere near Padua. He was the son of the aristocratic gentleman, Francesco. He studied at Padua under the Dominican Francesco Securo de Nardò, Professor of metaphysics *in via Thomae*, and Nicoletto Vernia. There, he became Doctor artium on 11 February 1483, and Nicoletto Vernia was one of his tutors. He received, thus, the degree of Doctor medicinae on 1 December 1486 (Vedova 1836; Nardi 1958; Lohr 2010). He married Donna Maria Roselli, the granddaughter of the well-known jurist Antonio, and had five children: four males (Francesco, Giulio, Alessandro, and Antonio) and one female (Alba) (Nardi 1958).

Since 15 November 1487, thus, Trapolino linked his life with the Sacro Collegio dei Medici e Filosofi and to the Faculty of Arts and Medicine of Padua. There, he taught initially *philosophia naturalis* and later, in 1493, medical practice and since 1495, theoretical medicine. He was professor, colleague, and also friend of Pietro Pomponazzi (Nardi 1958; Di Napoli 1963).

The Venetian war against the League of Cambrai seriously compromised the equilibrium at the *Studium patavinum*. On 6 June 1509, the German army of Emperor Maximilian I entered

Padua, and in the same day Trapolino died, at the age of 58, under unknown circumstances (Nardi 1958).

At his time, Trapolino was an important commentator of Aristotelian texts at the University of Padua and was the author of three still extant commentaries on Aristotle's *libri naturales: Expositio in IV libros Physicorum* (Ms Modena, Biblioteca Estense, lat. 375), *Quaestiones ac notabilia recollecta in libro Caeli* (Ms Venezia, Biblioteca Marciana, lat. VI 301), and *Quaestiones ac notabilia recollecta super libris De anima* (Lohr 2010). The commentary on *De anima*, composed during the last decade of the fifteenth century, is preserved in two manuscripts (Ms Perugia, Biblioteca Comunale, 408 and Ms Venezia, Biblioteca Marciana, lat. VI 301) which show some differences in the text. It is possible that they are two different *recollections* (or *reportationes*) of Trapolino's lectures transcribed by students. The *Quaestiones super De anima* held in the Venetian manuscript were recollectd by Benedetto Tiriaca, at that time student, who is also mentioned as the scribe of the commentary on *De caelo* kept in the same manuscript (Nardi 1965; Bakker 2012).

He wrote also some works on medicine: *Quaestiones super Hippocratis Aphorismi* (Ms Paris, Bibliothèque Nationale de France, lat. 6537); *Quaestio de aequali ad pondus* and *De restauratione humidi radicalis* (Ms Milano, Biblioteca Ambrosiana, N. 336 Sup.) (Bakker 2012).

Trapolino, together with Nicoletto Vernia, belongs to the Paduan Averroism, which since the beginning of the fifteenth century has been represented by Paolo Veneto and Gaetano da Thiene (Nardi 1958). Averroism arrived in Padua thanks to the spreading of Averroes' commentary on Aristotle's natural treatises and metaphysics. It was used to read Aristotelian texts together with those of the commentator even in comparison with other commentators (Alexander of Aphrodisias, Thomas Aquinas, Duns Scotus). That use arose controversies between Averroists and Thomists, a debate in which even the Church of Padua took part (Nardi 1958). One of the main themes regarded the unity of intellect, which

Trapolino also commented on. He maintained the souls as separated, *assistens et non informans*, saving nevertheless the individual immortality (Garin 1947; Saitta 1966). Following Aquinas, he put the human soul between the pure forms of celestial intelligences and the *formae omnino materiales* entirely linked to the matter. As the student of the Dominican Francesco Securo de Nardò, Trapolino took into a greater account the Thomistic commentary, often favoring it over the Averroistic one (Di Napoli 1963; Nardi 1965; Saitta 1966; Poppi 1970; Garin 1966). He, thus, kept a moderate Averroism and did not receive any censorship from the Bishopric, whereas Vernia did (Nardi 1958).

Traversari, Ambrogio

Born: 16 September 1386, Portico di Romagna

Died: 21 October 1439, Florence

Marzia Pontone

Archivio Storico Civico e Biblioteca Trivulziana, Milan, Italy

Abstract

Ambrogio Traversari was a Camaldolese monk and humanist who lived in Florence during the first part of the fifteenth century. At the age of 14, he entered the monastery of Santa Maria degli Angeli, where he devoted his time to studying and translating Greek literature. The distinctive feature of Traversari was his ability to choose texts coherent with his Christian vocation, beginning with the works of the Church Fathers, and to plan Latin versions of these texts aimed to a didactic and ideological purpose. In 1431, when Traversari became prior general of his Order and could no longer devote himself entirely to the patristic translations, he had the opportunity of putting into practice what he had theorized earlier. During the few years of his public life (he died in 1439), three fundamental moments can be recognized. From 1431 to 1434, he traveled through the Camaldolese and Vallombrosian monasteries, and made every effort to restore the original monastic rule. In 1435, he was sent as ambassador to the Council of Basel to avoid a new schism. Finally, from 1438, he took part in the Council in Ferrara and Florence, where he worked to support the union of the Eastern and Western Churches. The consequences of Traversari's diplomacy vanished after a few years, but his translations had a different fortune. Read, copied, and later printed, his translations offered readers of his time who did not understand Greek, the opportunity to read a huge variety of patristic texts in Latin.

Ambrogio Traversari: Life and Culture

Ambrogio Traversari, Camaldolese monk and humanist in Florence during the first part of the fifteenth century, was born of a noble family of Ravenna in Portico di Romagna on 16 September 1386. At the age of 14, he entered the order of Camaldoli in the monastery of Santa Maria degli Angeli in Florence. There he devoted his time to studying and translating Greek literature until he became prior general of his Order in 1431 because of Eugenius IV's will. To reconstruct Traversari's biography is still of primary importance the *Vita Ambrosii Traversarii Generalis Camaldulensium* written by Lorenzo Mehus in 1759 (Mehus 1759). Among the more recent works on this subject are Stinger (1977), Somigli and Bargellini (1986), Frigerio (1988), and Pontone (2010).

From the few letters written before he became prior general, Ambrogio Traversari shows a huge knowledge of classic and patristic literature and appears entirely devoted to the patristic translations from Greek, a language that he learned, probably with the support of the older monk Demetrio Scarano, about 15 years after he entered the monastery of Santa Maria degli Angeli. On these letters are no expressed references to Traversari's theological and juridical studies, even though the library of the monastery preserved many books on these two subjects (Magheri Cataluccio and Fossa 1979, pp. 82, 98–100). It is possible that Traversari, during his early education, studied them as well, as it was common in the Camaldolese Order, but in the correspondence selected years later, he decided to perpetuate the image of a humanist free from the cultural heritage of the Middle Ages.

In fact, in the case of Traversari, the proximity to the new humanistic trend is clearly revealed by his activity as a translator from Greek. The idea – widely shared among the humanists of the fifteenth century – was to renew the contemporary society (*renovatio*) looking back to the example of the ancient word handed down by the texts of the classic authors. The peculiarity of Ambrogio

Traversari, humanist and Christian militant, was to choose texts coherent with his ecclesiastical vocation, beginning with the works of the Church Fathers.

Traversari's translations are not always philologically acceptable, due the large number of they contain errors, but they gave readers of his time who did not understand Greek the opportunity to read an enormous variety of patristic texts in Latin. Before he became prior general, the Camaldolese translated about twenty works (full list in CALMA I. 2, pp. 204–207). The amount of his Latin versions is quite impressive. In detail, during his early years (from 1416 to 1420), he translated the second letter *De vita solitaria* of Basil of Caesarea; the short treatise *Adversus vituperatores vitae monasticae* of John Chrysostom; the *Scala paradisi* of John Climacus; the first part of the *Theophrastus* of Aeneas of Gaza (finished within 1431; see Pontone 2011, pp. 81–82); another work of John Chrysostom, *De providentia Dei ad Stagirium*; and perhaps the first sermon *De statu*s. During the following years, Traversari translated other patristic works: Manuel Kalekas, *Contra errores Graecorum*; John Chrysostom, *Sermones contra Judaeos* and *Quod deus incomprehensibilis sit*; Basil of Ancyra, *De vera integritate virginis* itis; Ephrem the Syrian, *Sermones*; Gregory the Presbyter, *Vita Gregorii Nazianzeni*; and Palladius, *Vita sancti Johannis Chrysostomi*.

For some of these translations from before 1431, the manuscript tradition preserved the autograph versions as well: the so-called *Vitae Patrum*, a miscellany of hagiographic and ascetic works, translated between 1423 and 1431 (MS Firenze, Biblioteca Nazionale Centrale, Conventi Soppr. G. IV. 844), some sermons of John Chrysostom on St. Paul's letters (MS Firenze, Biblioteca Nazionale Centrale, Conventi Soppr. J. VI. 6), and some texts of, or attributed to, Athanasius of Alexandria (the treatises *Contra Gentiles*, *De incarnatione Verbi* and *Disputatio contra Arium*, MS Firenze, Biblioteca Nazionale Centrale, Conventi Soppr. J. VIII. 8).

In the coherent group of patristic translations made by Ambrogio Traversari during his early years, there is only one exception: the Latin version of the *Vitae philosophorum* of Diogenes Laertius, begun between 1424 and 1425, but finished only in 1433. Even though this translation presents many stylistic problems, it was one of the most widely spread translations made by the monk, because of the concise survey of the lives and thought of the ancient Greek philosophers.

Traversari had many difficulties in translating the *Vitae philosophorum*. It is true that the Camaldolese found many linguistic and rhetorical problems, because Diogenes Laertius' Greek was very different from the Byzantine Greek he was used to. But – most of all – Ambrogio Traversari met a lot of ideological and theological obstacles, especially in reading the tenth book on Epicurus' philosophy that, in fact, remained unfinished for years, from 1425 to 1433. It was only to satisfy Cosimo de' Medici's and Pileo de' Marini's will that the monk completed the Latin version of the *Vitae philosophorum*. Or, at least, this is the justification that he presented in his letters. What seems clear is that the pagan subject of Laertius' work clashed with the Christian vocation that moved the monk in choosing the patristic texts to translate (Gigante 1988, pp. 367–404). It does not mean that Traversari did not recognize the high educational value of the Classics, but he feared to make them easily comprehensible through Latin versions, as he wrote in his preface to the *Vitae philosophorum*. Even so, the translation was finished, because the Camaldolese was persuaded that it was necessary to understand the historical root of the *sapientia Graeca* to understand the contemporary East as well (Vasoli 1988, pp. 83–84, 87).

It seems clear thus that the plan of Latin versions realized by Ambrogio Traversari was aimed at a didactic and ideological purpose coherent with his Christian vocation. Even though the choice of translating patristic texts seems to remove the monk from the humanistic group, he agreed thoroughly to the renewal of *studia humanitatis* in the field of the style. In the dedicatory letter to the *Scala paradisi* of John Climacus,

the Camaldolese polemizes with Angelus Clarenus (the medieval translator of this text) and commends his new Latin version, no more *de verbo ad verbum* but *ad sententiam* (Stinger 1977, pp. 100–113). The result was much less innovative than what was expected (Sottili 1981, pp. 170–177; Varalda 2004, pp. 51–52, 56–61), but it is evident that Traversari strove to translate *ad sensum*, following the Ciceronian style and also respecting the meaning of the text, as a Humanist had to do (Cortesi 1995, pp. 470–484). The choice of translating patristic texts is therefore a peculiarity of the Traversarian Humanism, coherent with the religious aptitude of the monk.

In 1431, Traversari's life changed completely. When he became prior general Order, the Camaldolese was forced to leave the peacefulness of Santa Maria degli Angeli and begin a new frenetic life. During the few years of his public life (he died in 1439), three fundamental moments can be recognized. From 1431 to 1434, he traveled through the Camaldolese and Vallombrosian monasteries, making every effort to restore the original monastic rule. In 1435, he took part as an ambassador in the Council of Basel, where he supported Eugenius IV's interests; for the same reason, he met Emperor Sigismund of Luxembourg. Finally, in 1438 he took part in the Council, moving first to Ferrara and then to Florence, where he worked hard to support the union of the Eastern and Western Churches.

Ambrogio Traversari did not have enough time to devote himself entirely to the patristic translations as during his cloistered life, but he had now the great opportunity of putting into practice what he had theorized before. For example, during his long journey through the Camaldolese and Vallombrosian monasteries (1431–1434), he tried to restore the original monastic rule, in accordance with Martinus V's and Eugenius IV's will (Frigerio 1988, pp. 60–63). All his efforts ended in a failure, but in this project, we can recognize Traversari's idea to pursue a *renovatio* of the Church, free from excess of wealth, as the monk had theorized in the patristic translations of his early years. The Camaldolese wrote a *hodoeporicon* (or *commentariolum*) too, in order

to tell in a journey diary his moralizing experience and offer the readers a modern *exemplum* of monastic virtue (Dini-Traversari 1912; Tamburini 1985; Iaria 2005).

During the Council of Basel, the Camaldolese supported the union of the Latin Church, probably because he considered the peril of a schism the worst danger that the Church could suffer, even worse than the ostentation of wealth condemned by the Council (Stinger 1977, p. 192; Caby 1999, pp. 675–682). During these days in Basel, he translated three orations entitled *De pace* of Gregory of Nazianzus (No. 6, 23, 22) to theorize what he was trying to put into practice through the diplomatic relations (Way 1961, pp. 91–96; Gentile 2000, pp. 95–102).

Coming back from Basel, Traversari tried to translate other two long patristic works, the entire *corpus* of Pseudo-Dionysius the Areopagite and ninety sermons of John Chrysostom on Matthews' Gospel (Stinger 1977, pp. 154–156), but in 1437, Eugenius IV moved the Council to Ferrara and the Camaldolese had to leave once again his peaceful life in the cluster. The pope wanted to reunite the Eastern and Western Churches under his supremacy in exchange for the military support offered in the war against the Turks (Proch 1990, pp. 300–319). Therefore, Ambrogio Traversari was called to have a part in the completion of the historic event.

Supporter of the Churches' union (Somigli 1964; Rao 1994), Traversari followed the Council from Ferrara to Florence, where it was moved to avoid the plague and assure political stability thanks to Cosimo de' Medici's help (Fubini 1994, pp. 62–86). The wide knowledge of the Greek patristics and the unremitting efforts as a translator were the wider contributions that the Camaldolese gave to the success of this event. For example, he translated part of the *Adversus Eunomium* of Basil of Caesarea that Giovanni da Montenero used during the meetings of the Council in Florence (Stinger 1977, pp. 216–217). Moreover, Traversari deepened personal relations with a lot of Byzantine prelates, thanks to his knowledge of spoken Greek (Pontani 1994, pp. 762–765).

Finally, on 6 July 1439, the text of the union between the Eastern and Western Churches, the bull *Laetentur coeli*, was signed (Proch 1988). Traversari himself signed it, and then he retired to a cloistered life in the hermitage of Camaldoli to keep on with his studies. Unfortunately, on 21 October 1439, he died in the monastery of San Salvatore in Florence. The causes of his death are unknown. The consequences of Traversari's diplomacy vanished after a few years, but his translations had a different fortune. Read, copied, and later printed, a lot of his Latin versions became part of the most important humanistic libraries during the fifteenth and sixteenth centuries and offered readers that did not understand Greek the opportunity to read a vast variety of patristic texts.

Treatise, Renaissance

Anja-Silvia Goeing

Harvard University, Cambridge, MA, USA

University of Zurich, Zurich, Switzerland

Abstract

The Renaissance treatise (Latin, *tractatus*) is an explanatory text presenting descriptions, arguments, and evidence to formulate a valid opinion about an object of knowledge. The variety of topics in this format covers the entire range of scholarly disciplines. Renaissance authors used the notion of *tractatus* in philosophy, broadly defined, to present the following types of reasoning: encyclopedic overviews of a discipline; interpretations and reorganizations of ancient and medieval texts; mathematical, astrological, and cosmographical descriptions; and logical thinking. Whereas these forms evince different aspects of reasoning and modes of discussion, the term *tractatus* was also employed merely as an organizational element, in the manner of the late ancient notion of separate essays on the same subject within the same volume.

The notion of a philosophical treatise with which we are nowadays familiar through, for example, the *Tractatus Logico-Philosophicus* of Ludwig Wittgenstein (1922), was not the

sole form that Renaissance philosophical treatises assumed. On the contrary, there were a wealth of forms and formats and different ways of presenting arguments and collecting evidence, all connected under the headings “philosophy” and *tractatus*. Authors in this period were highly experimental, trying out new forms of reasoning and explaining.

Heritage and Rupture with the Tradition

The Renaissance treatise (Latin, *tractatus*) is an explanatory text presenting descriptions, arguments, and evidence to formulate a valid opinion about an object of knowledge (Latin, *res*). The variety of topics in this format covers all the scholarly disciplines and includes encyclopedic works such as an illustrated compendium about the identification of herbs, the *Tractatus de herbis* (1440), today in the British Library, as well as juridical discussions such as those about the jurisdiction of matrimony in the *Tractatus de matrimonio regis Anglia* (1530), and displays of architectural forms organized by category (*Tractatus de architectura*, c. 1250).

In order to stay as close as possible to the Renaissance notion of *tractatus* and also to embrace the whole of Europe, the following characterization of treatises is based on a thorough study of all – not just philosophical – Latin European treatises in print that have *tractatus* in their title and that have been cataloged by the Universal Short Title Catalogue (USTC), the most comprehensive database of Renaissance writing available on the Internet, with a chronological range from the beginning of print in the 1450s to the end of the sixteenth century. There are currently 3,860 treatises that match these criteria.

Philosophy in the context of the Renaissance included a number of different topics, and, to get to grip with the specifics of the philosophical *tractatus* as it was understood at the time, it will be helpful to work with the notion, which derives from Gregor Reisch’s *Margarita Philosophica* (1503), of an enhanced curriculum of the seven liberal arts plus ethics and natural philosophy.

Leaving aside the often-contradictory disciplinary borders and developments of contemporary philosophy, the samples considered here are representative of various aspects of topics and formats connected to the Latin treatise of the Renaissance.

As regards the geographical distribution of the 3,860 books with *tractatus* in their title, 1,479 were printed in the Italian peninsula, 995 in France, 946 in the Holy Roman Empire, 138 in Spain, 129 in the Low Countries, 96 in the Swiss Confederation, 28 in England, 26 in Poland, 17 without any indication of country, and nine in Portugal. Measured against the Latin print production of these countries or regions, the Italian peninsula leads with 3.85%, followed by Spain (2.85%) and France (2.52%). Portugal (1.86%) and the Holy Roman Empire (1.74%) are next, and the last group consists of England (1.12%), Poland (0.99%), the Low Countries (0.95%), and the Swiss Confederation (0.92%). These figures also show that the Latin term was not used as frequently in German-, English-, Dutch-, and Polish-speaking countries as in lands where Romance languages were spoken (with the trilingual Swiss Confederation as an exception). This raises the question of whether choosing the title *tractatus* was a purely linguistic decision or, instead, was influenced by the spread of Protestantism. Given that Protestantism had an effect especially on juridical and religious texts, the latter possibility seems more likely, since over 50% of all titles containing the term *tractatus* are found in the fields of jurisprudence (1,370) and religion (837). It seems that authors of Protestant jurisprudence and religion may have preferred to erase any link to the medieval scholastic *tractatus* by using other title keywords. This would explain why, at least during the sixteenth century, the term *tractatus* was used less in the British Isles and in the Protestant parts of the Holy Roman Empire and of the Low Countries than in Southern Europe. Jurisprudence and religion are not, however, among the disciplines covered by Reisch’s definition of philosophy, and medicine (296) is also excluded. The remaining titles (1,357) represent the liberal arts along with ethics and natural philosophy. The format of the *tractatus* was developed in different ways over the centuries,

according to the preferred methods of reasoning adopted by the various philosophical disciplines, with the help of the learned community known as the “Republic of Letters.”

Innovative and Original Aspects

Throughout the period from 1450 to 1600, authors used the notion of *tractatus* in philosophy, broadly defined, to present the following types of reasoning: encyclopedic overviews of a discipline; interpretations and reorganizations of ancient and medieval texts; mathematical, astrological, and cosmographical descriptions; and logical thinking. Whereas these forms evince different aspects of reasoning and modes of discussion, the term *tractatus* was also employed merely as an organizational element, in the manner of the late ancient notion of separate essays on the same subject within the same volume such as in the treatise on alchemy attributed to the legendary Hermes Trismegistus, *Septem tractatus seu capitula ... aurei*, published in Strasbourg in 1566.

An example of the type of layout found in the Renaissance *tractatus* is an early printed encyclopedia of natural history entitled *Ortus Sanitatis* (c. 1507) and attributed to the Frankfurt town physician Johannes Wonnecke of Kaub (Johannes of Cuba). A version of this book, containing only the section on herbs, first came out in Latin in 1484 and then a year later in German (Hirsch 1876); the last edition was published in 1538. The 1507 Latin edition separates the book into different *tractatus*: one each on herbs, animals, birds, fish, stones, and – showing that it is a medical reference book – types of urine. Each *tractatus* has encyclopedia-style entries arranged in alphabetical order and called chapters (*capitula*), most of which have identifying woodcut illustrations. Each chapter contains the physical description and medical use of one species. In this way, many short chapters combine to make one treatise, and six treatises make one book. The treatise on herbs is the most comprehensive, with more than 200 leaves, over 500 illustrations, and 530 chapters, accounting for more than half of the entire book. An alphabetical index for each

part of the book, placed at the end of the volume, indicates the medical use of the different species, thus helping the practitioner to find the right plants, animals, or stones for medical recipes. The development of encyclopedic printed reference books on natural history starts with works such as this which use the term *tractatus* in their title.

Another characteristic example is Heinrich Glarean’s new and annotated edition of Donatus’ Latin grammar, first published in 1535, together with eight *tractatus* of his own covering the main topics dealt with by the ancient grammarian: generic nouns, their declension, comparative forms, irregularities, conjugation, grammatical rules, syllables, and figures of speech such as tautologies or enigmas (Donatus 1535, 1540; see also Donatus 1527). Glarean’s eight treatises deploy many examples in order to explain how to understand and apply Donatus’ rules. This entailed a radical extension and transformation of the ancient grammarian’s approach. While Donatus’ grammar was designed to be short, so that children could memorize the declensions of nouns and conjugations of verbs, Glarean had a very different pedagogical aim: at more than 100 folios in length, his treatises were not intended to be memorized, but were instead explanatory statements to be consulted. From a dictation manual for teachers of small children, Glarean’s edition of Donatus had become a reference book for independent scholars of all ages. His eight *tractatus* had turned an ancient grammar text into an accessible manual for self-study and a repertory of grammatical information.

The questions about universals (*Quaestiones de universalibus*) written by the Oxford Franciscan John Duns Scotus before 1295 were used in the second half of the sixteenth century as university texts. The Paduan professor Gaspare Torri (1531–1595), who adopted the Franciscan convent name of Costanzo Boccadifuoco, or Sarnano (Moroni 1840; Dreyer et al. 2013), explained these questions to his students and published his lectures in 1576 in Venice (Boccadifuoco 1576). In this volume, he refers to Duns Scotus’ chapters as a sequence of *quaestiones* in order to highlight the scholastic format of late medieval syllogistic

argumentation. Boccadifuoco added one *tractatus* of his own to the volume, in which he introduced his young students to the methods of constructing a syllogistic *quaestio* and thus provided them with a manual, not only for understanding Duns Scotus' way of constructing logical deductions but also for formulating their own. (Boccadifuoco 1576, 503–525). Seven years later, in 1583, Boccadifuoco finally published an amended text of Duns Scotus' treatise, prefaced by a short biography of the “Doctor subtilis” (Scotus 1583).

Impact and Legacy

The *Tractatus Logicus-Philosophicus* by the Austrian-born philosopher Ludwig Wittgenstein was a milestone in the new twentieth-century direction taken by philosophical argumentation, which aimed to understand and criticize the use of language in relation to the perception of the world (Wittgenstein 1922). In Bertrand Russell's words: “Mr Wittgenstein is concerned with the conditions for a logically perfect language ... that the whole function of language is to have meaning, and it only fulfills this function in proportion as it approaches to the ideal language which we postulate” (Russell 1922). The predecessors of Wittgenstein were philosophers of the Holy Roman Empire in the seventeenth century who used the title *tractatus logicus* in works they produced for universities. Two examples of this highly stylized genre, both exercises in syllogistic argumentation, were published in Giessen near Frankfurt am Main by Christoph Scheibler, a Lutheran philosophy professor at the University of Giessen: one on propositions and axioms and the other on syllogisms (Scheibler 1619a, b). Scheibler first explained the structure of truth-bearing sentences and presuppositions and then the methods of logical thinking, referring back to Aristotle and the medieval tradition of the *quaestio* (Roncaglia 2003). Another example of a *tractatus logicus* was a published examination for a philosophy doctorate in logic at the Lutheran University of Wittenberg: the student respondent was Christoph Boehm, and the philosophy professor Martin

Caselius presided over the examination (Caselius and Boehm 1633). Published dissertations were also quite common in the Holy Roman Empire from the seventeenth century onward (Marti 2011).

Although there are no sixteenth-century works called *tractatus logicus* in the USTC database, there are 1,008 Latin entries with titles containing the term *dialectica* – that part of logic which explained how to formulate an argument (Brown 1966, 26) – mostly without *tractatus*. With the appearance of the *tractatus logicus*, however, the seventeenth century witnessed a revival of medieval scholastic forms emphasizing the syllogistic *quaestio*, a trend which was connected to a revival of metaphysics (Posy and Ferejohn 1993; Hartbecke 2006; Smith 2010.)

The notion of philosophical treatise we are now familiar with, the *tractatus logicus*, was not the only form that Renaissance philosophical treatises assumed. On the contrary, the fifteenth and sixteenth centuries devised a wealth of forms and formats, along with different ways of arguing and collecting evidence. Even though most treatises referred in one way or another to writings from antiquity and from the Middle Ages, Renaissance authors were highly experimental, trying out new forms of reasoning and explaining.

Abstract

Following his conversion from Judaism to Calvinism and flight from his native Italy, Immanuel Tremellius enjoyed a distinguished career as a professor of Hebrew and Old Testament studies at a range of academies and universities in northern Europe. As a scholar, he was responsible for a series of works of Christian–Hebraica. The most famous of these was his translation of the Old Testament into Latin, coauthored with Franciscus Junius, and first published in 1575–1579: this became the most important Protestant Latin Bible of the sixteenth century. As a whole, Tremellius’ career highlights the significance of Hebrew and the Jewish tradition to the Reformation.

Biography

Immanuel Tremellius was born a Jew in Ferrara in around 1510. In about 1530, he moved to Padua, where he may have attended the university. During the course of that decade, he began to move in eminent circles: among his contacts at this point were the Cardinals Alessandro Farnese (the future Pope Paul III) and Reginald Pole (the future archbishop of Canterbury). Pole oversaw Tremellius’ conversion to Catholicism, and also helped him to obtain his first post, recommending him to Peter Martyr Vermigli, the new prior of the Augustinian monastery at Lucca. Tremellius taught Hebrew there. During his short time in Lucca, Tremellius also gained greater familiarity with the works of a number of Protestants and evangelicals. Following the establishment of the Roman Inquisition, Tremellius left Italy in 1543, settling first in

Strasbourg, where he taught Hebrew at the recently established Academy. In 1549, he moved to England, and soon took up the post of Regius Professor of Hebrew at Cambridge. On the accession of the Catholic Mary Tudor, he returned to the continent, and in 1554 became tutor to the young children of the Duke of Zweibrücken, in time becoming rector of the Academy which the Duke founded in Hornbach. In 1561, he became Professor of the Old Testament at Heidelberg, a position which he would hold for 16 years. In 1577, he moved to France where he became Professor of Hebrew at the Academy in Sedan. He died there in 1580, at the age of approximately 70.

Innovative and Original Aspects

Tremellius’ long, unusual, and illustrious career does much to explain the nature of his intellectual contribution, and its broader significance. As a convert from Judaism, he brought with him a proficiency in Hebrew and a familiarity with the Jewish tradition that was highly valued in both the lecture hall and in his publications. This was most apparent in the rapid explosion of career opportunities for someone with Tremellius’ skills: many of his posts were in institutions which had just been founded, and he was, consequently, one of the pioneers in the development of the study of Hebrew in the Reformation era.

A review of his published works illustrates the focus of his activities. These included a Commentary on Hosea, two works based on lectures which he had heard Martin Bucer deliver in Cambridge, a translation of the Targum Jonathan on the 12 minor prophets, a translation of the New Testament made from the Syriac, and an Aramaic and Syriac grammar. In addition, he was responsible for a translation into Hebrew of John Calvin’s Geneva Catechism, evidently intended to encourage further Jews to undertake the same religious transformation that Tremellius himself had undergone. Unlike most such “missionary” works of the period, Tremellius’ edition was distinguished by its absence of anti-Jewish polemic.

Legacy and Impact

Tremellius' most famous work, however, was his translation of the Old Testament, produced in conjunction with the French scholar Franciscus Junius, and first published by the Wechel presses of Frankfurt in five folio volumes between 1575 and 1579. More than 30 editions of this work would issue from presses across Europe, in a range of sizes, between the late sixteenth and early eighteenth centuries. The translation itself was characterized by its close fidelity to the language of the original; this was then supplemented by a large mass of notes and annotations, which largely avoided theological point-scoring, and instead focused on elaborating issues of historical and cultural importance. This edition of the Bible, which came to constitute a Calvinist equivalent to the Vulgate, was a critical element in the process by which the Reformed church established its independence from the Catholic Church. This work, and indeed Tremellius' entire career, in turn, epitomizes the Reformation's interest in, and dependence on, Jewish learning.

Trissino, Giangiorgio

Born: 1478, Vicenza

Died: 1550, Rome

Gabrielle Piedad Ponce-Hegenauer
College of Letters, Wesleyan University,
Middletown, CT, USA

Abstract

Giangiorgio Trissino (1478–1550), a patrician scholar, poet, dramaturge, translator, and theorist of Vicenza, is credited with having been the first to write in blank verse in Italian, the first to write a complete *Poetica* (Parts I–IV, 1529; Parts V–VI, 1562) in Italian, the first to write a formal Renaissance tragedy (*Sofonisba*, 1524), and the first to write an epic in blank verse in Italian (*Italia liberata da Goths*,

1547–48). His treatise, *Epistola del Trissino de le lettere nuovamente aggiunte ne la lingua italiana* (1524) initiated the linguistic debates known as the *questione della lingua*. He also introduced Renaissance scholars to Dante's *De volgare eloquentia*, unknown at the time of Trissino's translation. A patron of Palladio (1508–1580), he is said to have given Andrea Di Pietro della Gondola his name in honor of Pallas Athena and introduced the young stone mason to Vitruvius and other classical treatises. Trissino completed many of the designs for his villa at Cricoli, on which Palladio worked. The fragment of Trissino's architectural treatise and his musical reforms are among his least studied contributions but no less erudite and innovative. His Petrarchan lyric poetry found in the *Rime* (1524) was enriched by his extensive knowledge and study of poets pertaining to the *dolce stil nuovo*, the Sicilian school, as well as Provençal and Spanish poets. He was a Pythagorean and well-versed in Neoplatonic philosophy.

Alternate Names

Trissino, Gian Giorgio; Trissino, Giovan Giorgio

Biography

Trissino was born on July 8, 1478, to Gaspare Trissino and Cecilia Bevilacqua. The Trissino name can be dated to mentions in medieval chronicles, some of which Trissino employed during the composition of his epic poem, *Italia liberata da Goti*. Paolo Beni's *Trattato della origine della famiglia Trissina* (Padova, 1614) traced the Trissino name to a Greek from Trenze who had come to Italy during the age of Flavius Belisarius (505–565). Leo X (1475–1521) later advocated on Trissino's behalf for the return of feudal possessions – from Montecchio Maggiore to the foothills of the Alps referred to as “of Trissino” or “of the Agno” – from the Venetians which had been lost during the many invasions of Vicenza. Trissino's education was overseen by his mother,

Cecilia, following his father's death in 1487. The adolescence of Trissino and his younger sisters, Maddalena (b.1479) and Isabetta (b.1482), in Vicenza put them in contact with Italian intellectuals, particularly classical scholars, associated with the local *scuola di grammatica* (a center for Greek and Latin learning). Trissino's friendship with Francesco Maturanzio (1443–1518) dates from this period and Maturanzio later credited his years in Vicenza as those to which he owed the greatest debt. At the age of 16, Trissino married Giovanna, daughter of Francesco da Trissino, on November 19, 1494. The marriage lasted until Giovanna's early death on April 12, 1505. Of their five children, Francesco, Giulio, Cecilia, Gasparo, and Vincenzo, only Francesco and Giulio survived their mother; only Giulio lived to adulthood. Following Giovanna's death, Trissino pursued an itinerant intellectual lifestyle which he would maintain for the next 40 years until his death in 1550. From 1500 to 1502, he resided in Rome where he befriended Luigi da Porto (1485–1529), Bartolommeo Paghola (1472–1517), and others who frequented the circle of Battista Graziani. Graziani's gardens were host to an erudite group that included learned noblewomen such as Cassandra Fedele (1465–1558), Laura Veronese (Laura Brenzona), and Graziani's own daughter. In July 1505, Trissino traveled to Brescia where he met with the Gambara family, in particular, the poetess, Veronica (1484–1550), who is said to have rivaled Gaspara Stampa (1523–1554) and Vittoria Colonna (1492–1547). Trissino's intellectual foundation is marked by four early phases which occurred in Milan, Ferrara, Florence, and Rome.

Trissino's first deep immersion in the study of the classics occurred in Milan. In the autumn of 1506, Trissino entered the tutelage of Demetrio Calcondile (1423–1511) who was among the most important early exponents of Greek in Italy, responsible for the early education of Baldassare Castiglione (1478–1529), Angelo Poliziano (1454–1494), and others. Demetrio hosted an academy in his home attended by masters of Greek and Latin such as Giangiacomo Trivulzio (1440–1518), Aulo Giano Parrasio (1470–1522), Janus Lascaris (1445–1535), Jacopo Antiquario

(1444–1512), and Marco Musuro (1470–1517), many of whom were also members of the Greek academy pertaining to the Venetian printer, Aldus Manutius (1449–1513). By 1506, Milan had become a center for Hellenist studies, and Calcondile lectured there not only on the *Iliad* but also on the *Homeric Hymns*, the *Orphic Hymns*, and Apollonius of Tyana. Trissino also met the poets Camilla Scarampa (1476–1520) and Cecilia Gallerani (1473–1536), the latter of whom Matteo Bandello (1480–1562) dubbed both a muse and a Sappho, and who is thought to be the lady of Leonardo Da Vinci's "Dama con l'ermellino" (at the time, she was the consort of Ludovico Sforza, 1452–1508). Trissino also grew close to Margherita Pio (d.1524) with whom he would maintain a lengthy and unhappy epistolary affair. Ippolita Sforza (1481–1520), whose gardens became the site of numerous poetic and intellectual exchanges in Milan, also contributed to this period of growth. Already in Milan, it was said that over Latin, Trissino preferred the "language of Homer."

From 1509 to 1512, Trissino suffered a brief period of exile which arose from the uncertain fate of Vicenza following the League of Cambrai and the shifting alliances of the European powers. Trissino had been in attendance for the entrance of the Holy Roman Emperor, Maximilian of Austria (1459–1519), into Vicenza in October 1509. He composed an encomiastic poem for the emperor during his exile. By November 1510, he returned to Milan. In 1511, Calcondile died and Trissino would make an honorific mention of him in his *Ritratti* (1524).

In April 1512, Trissino arrived in Ferrara, where he quickly found favor with Lucrezia di Borgia (1480–1519), Duchess of Ferrara and wife of Alfonso d'Este (1476–1534). Her friendships with Pietro Bembo (1470–1547), Filippo Strozzi the Younger (1489–1538), Antonio Tebaldeo (1463–1537), and Ludovico Ariosto (1474–1533) coincided with Trissino's arrival. In Ferrara Trissino expanded his study of Greek to encompass Philosophy, Mathematics, Music, and Natural Science. He began his first thorough study of literature written in the Italian vernacular which would become indispensable for his *Poetica* and the foundation for all of his major contributions to

linguistic and literary theory. A lifelong Hellenist, Trissino dedicated his career to translating his own erudition into imaginative and theoretical works composed in Italian. In his dedication of the *Sofonisba* to Leo X, he explicitly stated that he had chosen to write in Italian rather than Latin in order to make the work accessible.

In 1513, Trissino went to Florence, the third significant juncture on his intellectual itinerary and a period that augmented his engagement with classical philosophy. He befriended Francesco Cattani da Diacceto (1466–1522), a master of Greek and Latin and earlier friend of Marsilio Ficino (1433–1499). It was by way of Diacceto that Trissino came to know Niccolò Machiavelli (1469–1527), Luigi Alamanni (1495–1556), and Giovanni di Bernardo Rucellai (1475–1525) among others who gathered for the Platonic discussions hosted at the Orti Oricellari. Already in 1513, Trissino was considered by the others to be more of a master and superior than a companion or equal.

In the autumn of 1513, Trissino returned to Ferrara where he continued to cultivate some of his most intimate relations with the Dukes of Este and Mantua. He came under the protection of Isabella Gonzaga (1474–1539), Marchioness of Mantua, sister of Alfonso di Este (1476–1534), and wife to Francesco Gonzaga (1466–1519), also known for her patronage of, among many others, Ludovico Ariosto (1474–1533) and Mario Equicola (1470–1525). It is to this period that the *Epistola de la vita, che dee tenere una donna vedova*, the *Rime*, and the *Ritratti* belong. The *Ritratti* was finished by March 1514 and there is evidence that Trissino had hoped to deliver the work in person to Isabella but with the requisite agreement that it would not be read by others for at least one year. The work is of a kind with Castiglione's *Libro del cortegiano*.

In 1513, Giovanni de Medici (1475–1521), son of Lorenzo the Magnificent, had been elected Pope Leo X. By 1514, Trissino returned to Rome where, among the many circles of artists and intellectuals cultivated by the new pope, he rekindled his friendship with Giovanni di Bernardo Rucellai. Rucellai's tragedy, the *Rosmunda* was one of the first to take Trissino's *Sofonisba* as its model. Firmly enmeshed in

literary circles in Rome, Florence, Ferrara, and Milan, as well as his home in Vicenza, he spent the next 40 years as a peripatetic in the most learned circles of northern Italy. He also visited Sannazaro and Isabella D'Aragn in Naples. But by 1515 much of the corpus which would appear in Rome in 1524 and in Vicenza in 1529 had already been written or conceptualized. It is likely that by this time Trissino had already read and studied Aristotle's *Rhetoric* and *Poetics* and begun work on his epic poem, the *Italia liberata da Goti* (1547–48). During the last 15 years of his life, he spent an increasing amount of time at his home at Cricoli where he composed his, mostly lost, architectural treatise and mentored Andrea Palladio. From 1538 to 1540, he lectured at Padua. Trissino, who took his example from Virgil, is thought to have been a Pythagorean. His engagement with the works of Aristotle as well as Plato and the Pre-Socratics, in the original Greek, makes him potentially one of the most interesting, and possibly pantheistic, thinkers of his period. Unfortunately, he did not find an open place for the articulation of these pursuits within Counter-Reformation Italy. A full assessment of Trissino's thinking, taking into consideration his extensive correspondence and wide-ranging friendships, remains to be undertaken. Trissino died in Rome on December 8, 1550.

Innovative and Original Aspects/ Heritage and Rupture with the Tradition

Questione della lingua

The debates over formal, aesthetic, and dialectic choices for the Italian language known as the *questione della lingua* began with the publication of Trissino's *Epistola del Trissino de le lettere nuovamente aggiunte ne la lingua italiana* (Rome, 1524). This largely "Tuscan question" intensified the following year with the publication of Pietro Bembo's treatise *Prose della volgar lingua* (Venice, 1525). In 1529, several of Trissino's works continued the debate in spite of the publication of numerous reactions to his proposals. In the *Poetica*, the *Castellano*, the *Grammatichetta*, the *Dubbi grammaticali*, and the *Alphabeto*, he further developed and altered his suggestions.

These works are most fruitfully studied together. Trissino's Italian translation of Dante's *De vulgari eloquentia* was also published that same year, and though this text would become a focal point of the debate, at the time of publication Dante's treatise was so unknown that some believed it to be Trissino's own work disguised under Dante's name.

Trissino's position took up two central subjects: (1) the introduction of spelling reforms through the use of Greek letters to indicate differences in pronunciation, such as on the long and short "o"; he reworked these spelling changes between 1524 and 1529, having found them too difficult for implementation; and (2) the construction of an Italian language out of vernacular writing in the many Italian dialects including but not limited to Tuscan. In contrast, Bembo argued instead that only Tuscan – the language of Dante, Petrarch, and Boccaccio – was to be considered the national language, Tuscan authors its exemplars. While the debate between Trissino's Italian and Bembo's Tuscan was amplified by several other interlocutors, Trissino's own use of Tuscan was extensive and all three of the *tre corone* are central paradigms in his *Poetica*. Trissino's friendship with Bembo remained until Bembo's death in 1547, which Trissino lamented with an encomiastic poem. Of his many texts on linguistic theory and practice, the *Castellano* is closest to the contemporary language debate: it is framed as an account recorded by Arrigo Doria of a discussion about Trissino's 1524 *Epistola*, which took place between Giovanni Rucellai and Filippo Strozzi. Trissino's advocacy of a courtly and illustrious Italian language constructed from a rich literary lexicon – as Greek had been refined through the conjunction of Attic, Ionic, Doric, and Eolic dialects – anticipates the Italian language practiced today.

Poetica

Trissino's *Poetica* is the first such work since Dante's *De vulgari* and Antonio di Tempo's *Summa Artis Rithimici Vulgaris Dictaminis* (1332). Trissino's innovation was to provide a work written in Italian which combined several schools and traditions of poets in European vernaculars. Trissino anticipates Boscán in Spain, Du Bellay and Ronsard in France, and Sir Philip

Sidney in England. In addition to Dante, Petrarch, and Boccaccio, Trissino cites extensively from Cino da Pistoia (1270–1336) and Guittone d'Arezzo (1230–1294). The majority of his exemplars are drawn from the poets of the *dolce stil nuovo* and the Sicilian school, though he also makes mention of Provençal and Spanish poets. As a Greek and Latin scholar, Trissino drew on Aristotle (the *Rhetoric* and the *Poetics*), Homer, Pindar, Virgil, Catullus, and Horace. Both Horace and Pindar had served as models for his own innovative odes. The *Poetica* expanded upon the *questione della lingua*, particularly the construction of a courtly and illustrious Italian out of the literary lexicons of several dialects. The *Poetica* of 1529 (Parts I–IV) was augmented with the posthumous publication of Parts V–VI in 1562. While published after Francesco Robortello's (1516–1562) translation of the *Poetics*, Trissino's treatise constitutes the first translation and study of Aristotle's literary theory in the Renaissance. Trissino's late comedy, *Il Simillimi* (1548) was modeled on Plautus's *Menaechmi*, but it was also thought to extend the missing part of Aristotelian theory regarding comedy, based on Trissino's inductive reading of Aristophanes.

Sofonisba

Already in Trissino's own lifetime Benedetto Varchi (1503–1565) and Giovanni Battista Giraldi, "Cinthio" (1504–1573) had lauded Trissino as the first Italian tragedian. Composed in Rome around 1514–1515, the *Sofonisba* was presented to Leo X in 1518 and published in 1524. It was printed no less than twenty times in Italy over the course of the sixteenth century. Initially circulated and consumed through manuscript copies and private readings, it was not performed until 1562 when Andrea Palladio designed the staging at the Teatro Olimpico in Vicenza. This was the same year that Parts V and VI of Trissino's *Poetica* were printed posthumously. Translated into French by Mellin de Saint-Gelais (1491–1558), it was performed for the court of Catherine de' Medici in the Château de Blois in 1556. It also appeared in a translation of Petrarch in England in 1554. *Sofonisba* was drawn not only from the precepts of Aristotle but also from

Trissino's thorough reading of Euripides and Sophocles. Its combination of Greek forms and Roman history as well as its amorous plot make it unique to the Renaissance. In the *Sofonisba* Trissino introduced the use of blank verse, reserving rhyme for the chorus. Years later, he would again employ blank verse in the composition of his epic poem, *Italia liberata da Goti*.

Impact and Legacy

Trissino's influence was felt most strongly in the use of blank verse, Renaissance tragedy, the genre of poetic (verse) treatises, translations, and implementations of Aristotle's precepts, and classical epic verse. The annotations of Torquato Tasso (1544–1595) to the *Sofonisba* were reprinted in Bologna in 1884. Tasso also employed Trissino's *Poetica* in his own *Discorsi del poema heroico* (1594). Tasso's father, Bernardo (1493–1569), author of *L'Amadigi*, praised the *Italia liberata*. While Torquato reacted negatively to Trissino's epic, his own *Gerusalemme liberata* is clearly indebted to Trissino. In their adherence to classical theories and exemplars, Trissino and Torquato Tasso are much closer in style than either was to Ariosto. John Milton (1608–1674) and Alexander Pope (1688–1744) likewise inherited Trissino's exemplar in the epic tradition, influence that extended to Voltaire (1694–1778) in France.

The *Sofonisba* became the paradigmatic model of classical Renaissance tragedy throughout the early modern period in all of the major European languages. It served as the primary model for the early dramaturgy of Miguel de Cervantes (1547–1616) in his *Numancia* and likely played a role in Milton's *Samson Agonistes*.

Trissino's influence on Andrea Palladio was also considerable.

Trithemius, Johannes

Born: 1 February 1462, Trittenheim

Died: 16 December 1516, Würzburg

Tomáš Nejeschleba

Centre for Renaissance Texts, Department of Philosophy, Faculty of Arts, Palacky University Olomouc, Olomouc, Czech Republic

Abstract

Johannes Trithemius was an abbot from the Benedictine monastery of Sponheim, and later the monastery of Würzburg. During his studies in Heidelberg, he was involved in

learned humanistic societies, and later he applied the ideal of humanistic eloquence in his works. Trithemius built large libraries and wrote a number of mystical, monastic, historic, and biographic writings. He became famous especially due to his book *Steganographia* which dealt with cryptography on the basis of natural magic and astrology working with angelic mediations. Though *Steganographia* remained in manuscript form, it influenced occult sciences in the sixteenth century and cryptography. Trithemius was also accused of necromancy and demonic magic.

von Heidenheim, Johannes; Heidenheim, Johannes von

Biography

Born in a village in the valley of the river Mosel, Trithemius became one of two celebrated thinkers of this region – next to Nicholas of Cusa, as it was emphasized by his contemporary Konrad Celtis (Arnold 1991). Trithemius studied in Trier, the Netherlands, and Heidelberg, where he was influenced by the humanistic movement. Together with Celtis, Jakob Wimpfeling, and Johannes Reuchlin, he formed a Rhenish literary society there. In 1482, Trithemius entered a Benedictine monastery in Sponheim. In 1483, he was elected abbot, and in the following years, he reformed monastic life and built a large and famous monastery library containing manuscripts and printed books from different areas of contemporary knowledge. In 1505, after being denounced by the monks, he had to leave Sponheim, and after traveling through Germany, visiting the court of Emperor Maximilian I and other various courts, he accepted an offer to become an abbot in the Benedictine monastery in Würzburg, where he spent the rest of his life, building a second library and reforming monastic life there.

Heritage and Rupture with the Tradition: Innovative and Original Aspects

Trithemius was the author of numerous mystical and monastic writings, in which he follows Jean Gerson and Nicholas of Cusa in advocating the idea of learned piety in monastic life (Brann 1999). Trithemius also wrote a number of historical writings, containing fantastic fictional stories, and cultivated a genre of bibliographical literature (Grafton 2006). In all his writings, the list of them is given by Klaus Arnold (Arnold 1991), Trithemius develops the humanistic ideal of eloquence of text.

Influenced by humanism, Hermetic writings, Neoplatonism, Pythagorean numerology, Renaissance Platonism, medieval scholasticism (Albert the Great), and Kabbalah, Trithemius created a conception of mystical magic (Brann 1981, 1999; Zambelli 2007). He worked with alchemical and astrological precepts leading to mystical magical illumination, which was kept secret. In his unfinished and unpublished book *Steganography* (Trithemius 1605), the ascent to heaven is realized on the basis of a hierarchical cosmological system, with the assistance of spiritual substances. Provided that occult harmony binds all parts of reality, these substances are steganographically in a cryptic language invoked for the sake of the soul, to achieve eternal bliss. In the book *Polygraphia* (Trithemius 1518), Trithemius defends himself against accusations of practicing black magic and creates another form of cryptography not comprising angelic mediations.

Impact and Legacy

Trithemius was visited in Sponheim by Agrippa of Nettesheim, who was influenced by him in both his systematic book on occult philosophy, *De occulta philosophia*, and his skeptical work, *De vanitate* (Müller-Jahncke 1991). Trithemius thus became one of the important founders of Renaissance magic and occult sciences (Walker 1975). The cryptological aspects of his work had influence on Giambattista della Porta, Paracelsus, and John Dee. On the other hand, the Carmelite

Arnold Bostius, to whom Trithemius sent a part of his *Steganography*, and philosopher Carolus Bovillus, another of Trithemius' visitors, accused him of advocating and practicing demonic magic. Trithemius was then also accused of necromancy and was later connected with Dr. Faustus legend (Baron 1991).

In the seventeenth century, Trithemius' *Steganographia* and his cryptography still remained popular. It was considered to be the discipline of language by the members of Royal Academic Society in particular. The occult principles, i.e., the angelic-astrological mediation lying under the cryptologic theory, were neglected in the favor of encoding and enciphering. As a magician and mystical theologian, on the other hand, Trithemius was praised in modern theosophy (Brann 2006).

Trivium

David Salomoni

Department of Education, Università degli Studi Roma Tre, Rome, Italy

Abstract

In the transition from the Middle Ages to the early modern era, the formal structure of the seven disciplines of the Liberal Arts, inherited from late Roman antiquity, remained unchanged; nevertheless, it underwent substantial alterations in terms of the content. Especially with regard to the Trivium, which aimed to provide students with a full set of language skills, the Renaissance saw the attention of educators moving away from medieval manuals to the works of the ancient authors and a general rebalancing of the importance of the three subjects which made up the Trivium – grammar, dialectic, and rhetoric – in favor of grammar. The Renaissance Trivium was not intended merely to enable students to acquire the linguistic knowledge required to pass on to the study of theology, as in the Middle Ages,

but became the main vehicle for educating the individual to virtue and action in the world.

Heritage and Rupture with the Tradition

During the Middle Ages and the Renaissance, the Trivium compressed the three Liberal Arts of grammar, rhetoric, and dialectic. This division is due to Martianus Capella, a late Latin philosopher (fourth to fifth century AD), who was responsible, among other things, for a classification of all human knowledge. We can find the first representation of the Liberal Arts in Martianus's *Satyricon* (410). Before him St. Augustine had tried to provide an organization for the Liberal Arts in his works *De ordine*, *De doctrina Christiana*, and *De musica*. In these treatises, Augustine attempted to show that the Liberal Arts correspond to mankind's need for natural knowledge, preparing the way to knowledge of God (Black 2001).

Another author who made a fundamental contribution to the structure of Liberal Arts was Cassiodorus. His works *De institutione divinarum litterarum* et *De artibus et disciplinis liberalium litterarum* defined the curriculum that became the norm during the Middle Ages. Cassiodorus also inspired the philosophical school of York, where intellectuals such as the Venerable Bede and Alcuin lived and worked. Alcuin revived Augustine's notion that the Trivium and the Quadrivium were propaedeutic to the study of theology. After Alcuin, the Trivium and the Quadrivium determined the practice of medieval teaching. Among the disciplines of medieval Trivium, dialectic played the dominant role, because it was identified with philosophy itself. Although the formal structure of the Trivium remained unchanged, the transition from the Middle Ages to the Renaissance brought substantial innovation.

Even during the Renaissance, the seven Liberal Arts preserved the traditional division between the Trivium and Quadrivium. The Trivium, however, was reinterpreted in order to respond to the new cultural needs of the time. What disappeared, for example, was the combination of grammar and dialectic, which, in the past, had served to provide a solid foundation for theology. It was replaced by

a return to the combination of grammar and rhetoric, in line with the interpretation of Quintilian, whose *Institutio oratoria* was recovered in the 1420s. Grammar, during the Renaissance, performed new functions which made it the base discipline for all linguistic subjects. Dialectic, on the other hand, was restored to the role it had played in late ancient times, that is, in the field of eloquence and elegant speech. Taken together, the three disciplines of the Trivium in the fifteenth century were reconfigured by taking a direct and systematic approach to the *auctores* – the most important classical authors for education – while completely excluding medieval *summae* and making only limited use of manuals (Grendler 1989, 2002).

In the new Renaissance conception, grammar was needed to achieve several ends. Among these were how to explain and interpret words, investigate and expound poetry, and learn history. The Renaissance's finest educators, such as Vittorino da Feltre and Guarino da Verona, adhered strictly to the guidance of Quintilian in his *Institutio oratoria*. They divided the teaching of grammar into two key stages: the learning of language for the purpose of explaining and interpreting words and the analysis and explanation of authors, in relation to the study of poets and the learning of history. The first language to be taught was Latin, to which some masters, like Vittorino, added Greek (Huntsman 1983).

In the teaching of Latin grammar, we can clearly see the elements of continuity and rupture between the medieval Trivium and the new Renaissance model. The basics of grammar were still generally learned from Priscian's *Institutiones*, as in the Middle Ages. This work, however, was supplemented in the Renaissance by Diomedes, *Ars grammatica*, and Nonius Marcellus, *De compendiosa doctrina*. Using these manuals, teachers often addressed issues such as morphology, phonetics, syntax, and accentuation. For the study of lexicography, Renaissance teachers used the ancient encyclopedic authors, especially Pliny the Elder, Marcus Varro, Marcus Cato, and Cornelius Celsus.

For the teaching of Greek grammar, the Renaissance Trivium adopted the *Erotemata*, in

the version by the Byzantine scholar Manuel Chrysoloras, which was revised, abridged, and translated into Latin by Guarino da Verona. This primer was, in some rare cases, supported and supplemented by the work of Polybius of Sardis, *De barbarismo et solecismo*, a copy of which, for example, was owned by Vittorino da Feltre for his pupils, as the catalog of his books shows, while for etymological and lexicographical issues the massive Byzantine encyclopedia entitled the *Suda* could be used (Botley 2010).

In the Renaissance Trivium, although the use of manuals was very reduced in comparison to the Middle Ages, textbooks, with their *regulae* and *exempla*, nevertheless remained an essential tool, a fundamental prerequisite to achieving linguistic competence. In the study of Greek and Latin, however, the Renaissance Trivium added an empirical approach in which they were treated as living languages. The first step was for teachers to introduce their students to relatively easy poetry, usually from Homer and Virgil. The next step was learning excerpts from authors of increasing difficulty, usually the letters of Cicero and the speeches of Demosthenes, analyzing the words (*verba*) and defining the meaning and construction of each of them, in order to advance to the second phase: exposition. Once the students were able to recite Homer, Virgil, and Cicero by heart, the first part of learning of grammar was concluded, since this showed that they had acquired both the theory and the technique of grammatical analysis (Black 2007).

Subsequently, the approach became less technical and more hermeneutic. The reading of *auctores* aimed to provide students with the life lessons handed down by these authors, in line again with the advice of Quintilian, for whom grammar was not confined to a sterile set of language skills but had to lead to *sapientia* ("wisdom"). The study and reading of ancient historians were particularly important. In a sense, in the Renaissance Trivium, the study of history took place within the learning of grammar. The reason, according to some important Renaissance educators, was that, from both a technical and a pedagogical point of view, while philosophy, poetry, and history were similar in content, history was closer to the realities of life

and was, therefore, better able to attract the attention of young people. In addition, the use of history textbooks enabled students to complete their education in the grammatical rules of prose (Woodward 1996).

The Latin historians studied within the grammar curriculum were generally Livy (*Historiarum Romanarum decades III*), Sallust (*Bellum Catilinae*, *Bellum Iugurthinum*), Julius Caesar (*Commentarii de bello Gallico*), and Valerius Maximus (*Memorabilia*). Among those educators who taught also the Greek historians, we find authors such as Plutarch (*Parallel Lives*), Xenophon (*Memorabilia*), Thucydides (*The History of Peloponnesian War*), and Arrian (*The Anabasis of Alexander*) (Woodward 2013).

After the historians, the teaching of grammar in the Trivium included a section on poetry. Again, the initial aim was to complete the students' skills in grammar, metrics, and style; only afterwards did the focus move to the content of poetry. In this way, they came into contact with the ideas of the ancients, learning to embrace virtue and reject vice. Among the Latin works studied were Virgil's *Eclogues*, *Georgics*, and *Aeneid*, Horace's *Satires* and *Odes*, and Ovid's *Metamorphoses* and *Tristia*.

Other poetical works in the Renaissance Latin grammar curriculum were Lucan's *Pharsalia*, the comedies of Plautus and Terence, and the *Satires* of Persius and Juvenal. The Greek part of the poetic curriculum usually included Homer's *Iliad* and *Odyssey*, Aesop's *Fables* in verse, the comedies of Aristophanes, and Theocritus's *Eidyllia* for older pupils. Among other authors, we find Aeschylus, Sophocles, Euripides, and Hesiod. The teachers, in their lessons, were not confined to expounding these authors but often urged students to practice the *ars poetica* themselves, that is, to engage in imitative composition.

Within the program of the Trivium, the next subject to be taught was dialectic. The purpose of this course was the formation of Quintilian's ideal orator ("vir bonus dicendi peritus"), a man who combines eloquence and moral perfection. In this field as well, the Renaissance Trivium followed the guidelines set out by Quintilian, who assigned greater importance to ethics, that is, the transmission of the contents and ideas of texts, than to

aesthetics. It was widely thought, moreover, that dialectic was a science that related to the realm of *opinio* (“opinion”) and not of *veritas* (“truth”) and that it made itself explicit, above all, through *elocutio* (“expression through words”).

Some educators defined dialectic according to two interpretative keys: a rational science of discourse and the interpreter and guide of all the arts. From this point of view, therefore, emerges a full recovery of Aristotelian concepts, confirmed by the works that we find widespread for this teaching: the entire Aristotle’s *Organon* (in particular, the *Analytics* and *Topics*) and Boethius’s *De hypotheticis syllogismis*, which is a commentary on Aristotle’s *Categories* (Stump 1983).

Regarding educational practice, we know that instruction in dialectic was divided into two essential parts: the first was dedicated to the reading of texts and the explanation of rules, while the second was dedicated to the discussion and practice of syllogisms. The dialectical syllogism for many Renaissance masters was equivalent to the Aristotelian syllogism, that is, a rational argument aimed at persuasion but unsuitable for demonstrating the truth in an absolute sense. Overall, the lessons in dialectic were more practical than theoretical because teachers wanted their students to acquire three basic language skills: the ability to define the subject, the ability to distinguish between genres, and the ability to draw conclusions from a speech. Once these objectives had been achieved, the student could go on to the rhetoric course (Eisenbichler and Terpstra 2008).

The teaching of rhetoric in Renaissance schools and colleges began with the reading of treatises (*lectura*), followed by exercises in the translation and imitation of the main classical authors (*auctores*). The most important Latin author was Cicero, especially the *Philippics*, along with his letters and treatises. For the Greek language, the key authors were Demosthenes and Isocrates. Both in Greek and Latin, however, the aim of the masters was to teach schoolchildren to write in a concise and clear style, without bombast. Once they had acquired the basics of the discipline, students had to prepare a speech to declaim in front of their classmates, as had been the custom in ancient schools of rhetoric. The

study of rhetoric was thus finalized by practical and professional activities, using all the language resources which the students now possessed.

With rhetoric, studies of the Trivium, designed to provide a full linguistic education, were completed. The acquisition of this expertise gave students access to the next stage of their education, the Quadrivium, the part of the humanist curriculum covering arithmetic, geometry, music, and astronomy (Camargo 1983).

This, then, was the general conception of the Trivium promoted by fifteenth-century educators such as Vittorino and Guarino. After the Council of Trent, moreover, the leading pedagogues of the Counter-Reformation, especially the Jesuits, took over the Renaissance rethinking of the Trivium and the Liberal Arts. Their “educational ideal was clearly humanistic . . . in line with the civic orientation of Renaissance humanism” (Casalini and Pavur 2016). The Jesuits brought this reformulation of the Trivium into the colleges that they established at the four corners of the world, alongside their work of evangelization.

Dipartimento di Studi Umanistici, Università degli Studi di Bari Aldo Moro, Bari, Italy

Abstract

Antonio Trombetta was an Italian Roman Catholic Bishop, member of the Order of Friars

Minor (Franciscans), and Scotist philosopher. He taught metaphysics at Padua, first as a regent of the Paduan school of metaphysics and later as a holder of the public chair of metaphysics *in via Scoti*. His major works are the *Opus doctrinae scoticae Patavii in thomistas discussum* (Venice 1493), in which he investigates some of the most relevant topics of Aristotelian metaphysics; a *Tractatus singularis contra Averroistas de animarum humanarum pluralitate ad catholice fidei obsequium* (Venice 1498), in which he discusses the Averroistic doctrine of the unicity of the intellect, opposing the interpretation promoted in Padua by Nicoletto Vernia and Agostino Nifo; and, finally, a *Tractatus formalitatum* (Venice 1502), in which he reworks some outstanding items of the ontological vocabulary developed by John Duns Scotus and his early followers. He exerted a strong influence on sixteenth- and seventeenth-century Scotism.

Biography

Antonio Trombetta was born in Padua, in the Italian region of Veneto, in 1436. From a very young age, he showed a particular aptitude for studies. In 1451 he began extensive training that included the study of grammar, rhetoric, philosophy, and theology. This training took place mainly in the Franciscan Theological Studium at Padua, where Trombetta received a biblical bachelor's degree in 1460 (Poppi 1962, p. 353).

After comprehensive philosophical training, which allowed him to approach the study of John Duns Scotus' works and, probably, some commentaries by John of Jandun and Walter Burleigh, Trombetta became regent of the school of metaphysics at Padua in 1469 (Mahoney 1978,

pp. 214–227). His edition of the commentary on the first book of the *Sentences* by John Duns Scotus (*Quaestiones in primum librum Sententiarum Petri Lombardi*) dates back to those years. In 1476 (or 1477), after long training on the writings of Duns Scotus, Trombetta was appointed to the public chair of metaphysics *in via Scoti* (which he inherited from the Augustinian Thomas Pencket). This period of his teaching is characterized by a lively debate with the Dominican Francesco Securo di Nardò, who was then occupying the chair of metaphysics *in via Thomae* (which, a few years later, would inherit the Dominican Thomas de Vio Cajetan).

Trombetta's success was immediate. In only a few years, he became the most important representative of the Scotist tradition in Padua. His importance, however, was not only cultural and academic but also institutional. In 1489 he was named Provincial Minister of the Franciscan Minor Order: re-elected several times, he remained in office for around 10 years (Poppi 1962, p. 354). Some of his main works date back to this period. In 1490 Trombetta wrote a commentary on *De coelo et mundo*. Only 3 years later, in 1493, he published one of his most influential works, the *Opus doctrinae Scoticae Patavii in Thomistas discussum*, in which he condensed the results of his teaching. The work is actually a collection. It includes, indeed, a treatise on future contingents (*Quaestio de divina praescientia futurorum contingentium*), a series of metaphysical questions (*Quaestiones metaphysicales*), a commentary on the *Formalitates* by Antoine Sirect (*Tractatum formalitatum Scoticarum sententia*), and an edition of Antoine Sirect's treatise (*Hebdomades formalitatum recentiores secundum Doctorem subtilem*).

In the same years, the Paduan intellectual and academic milieu was characterized by a lively discussion regarding Averroes' doctrine of the unicity of the intellect. The debate quickly took on heated tones, so much so that the Bishop of Padua, Pietro Barozzi, decided to issue an edict prohibiting public disputes about monopsychism (1489). In the framework of this debate, which involved some influential philosophers (among whom the names of Nicoletto Vernia, Agostino

Nifo, and Alessandro Achillini stand out), Trombetta published, in 1498, his *Tractatus singularis contra Averroistas de animarum humanarum pluralitate ad catholice fidei obsequium*. This work had a twofold purpose. On the one hand, it aimed to demonstrate the compatibility of Averroes' writings with some fundamental assumptions of scholastic Aristotelianism (or at least to show the unsustainability of some of Averroes' theses). On the other hand, on the contrary, it was intended to stem the spread of the impious and philosophically untenable interpretations promoted by the Averroists who taught in Padua (above all, Nicoletto Vernia and Agostino Nifo) (Mahoney 1976, pp. 289–301).

In those years, having reached the pinnacle of his career as a professor, Trombetta began to suffer the opposition of his brethren. As a result of these circumstances, Trombetta resigned in 1498 as Minister Provincial of the Order. Subsequently, he also sought election as Minister General, but without success. During this period, having ceased to hold any office in the Order, Trombetta devoted himself mainly to teaching and the re-elaboration of some of his works. He published an augmented and revised edition of his metaphysics – the *Opus in Metaphysicam Arist. Padue in thomistas discussum*, printed in Venice in 1502. Like the previous edition, this edition also included a treatise on “formalities” inspired by the teaching of Antoine Sirect (*In tractatum formalitatum Scoti sententia*). After 1502 this treatise *de formalitatibus* would be printed several times separately, strongly influencing the evolution of Scotism throughout the sixteenth century.

Trombetta's diplomatic career within the Order only resumed in 1504, when he was re-elected Provincial Minister of the Order and Apostolic Commissioner for the Province of Milan. Later, on 7 November 1511, Pope Julius II ordained him Bishop of Urbino and entrusted him with the task of participating in the Ecumenical Council *Lateran V* (1512–1517). Trombetta's participation in this Council was discontinuous due to his ailing state of health. Nevertheless, Trombetta continued to study and, in 1513, he published in Padua a *Quaestio profunda de efficientia primi principii*,

in which he dealt not only with divine causality, as the title clearly states, but also with the attribute of intensive infinity (*infinitas intensiva*).

At this stage, Trombetta's state of health was becoming increasingly precarious. As a result, he resigned in 1512 as Provincial Minister of the Order and, in 1514, as Bishop of Urbino. On 29 May 1514, he was, however, appointed Archbishop of Athens, but his ministry was neither influential nor innovative. Trombetta died in Padua on March 6, 1517 (Poppi 1962, p. 365).

Contribution to Renaissance Philosophy

Trombetta's contribution to Renaissance and early modern philosophy is significant. It mainly concerns three objects (and three areas of investigation): firstly, metaphysics, to which the Paduan philosopher dedicated the *Quaestiones metaphysicales* that are included both in the *Opus doctrinae scoticae Patavii in thomistas discussum* (printed in Venice in 1493) and in the *Opus in Metaphysicam Arist. Padue in thomistas discussum* (printed in Venice in 1502 and 1504); secondly, the Scotist-inspired doctrine of formalities, to which he dedicated his *Tractatus formalitatum* (reprinted several times since 1502); and thirdly, the Averroistic doctrine of the unicity of the intellect, which Trombetta dealt with extensively in his *Tractatus singularis contra Averroistas de animarum humanarum pluralitate ad catholice fidei obsequium* (printed in Venice in 1498).

An interest in metaphysics dominated Trombetta's entire intellectual and teaching career. From 1469 (when he became regent of the school of metaphysics at Padua) until 1511 (when he definitively abandoned teaching), he never stopped working on metaphysics. In this regard, his purpose is clear and outlined. Trombetta intends, first of all, to provide metaphysics with a systematic structure. In his *Quaestiones metaphysicales*, he abandons the style of commentary and proposes a reorganization of the main contents of metaphysics within the framework of precise and well-defined questions. In this regard, his goal is not to comment on

every single book or chapter of Aristotle's *Metaphysics* but rather, much more prominent and decisive, to identify the principal nodes of Aristotelian ontology to be tackled systematically. The interpretation of metaphysics that he elaborates in his *Quaestiones metaphysicales* is strongly inspired by Duns Scotus, of whose philosophy he was becoming the most authoritative representative in Padua (Forlivesi 2008, pp. 265–277; Forlivesi 2014, pp. 29–35). From 1471 to 1511, Trombetta held the public chair of metaphysics *in via Scoti* and represented the Scotist position in the numerous debates that animated the University of Padua in those years. Trombetta's metaphysics takes up some of the main topics dealt with by Duns Scotus in his commentaries on the *Sentences* (Scapin 1966, pp. 501–504). In Trombetta's *Quaestiones metaphysicales*, special attention concerns the doctrine of the univocity of being, undoubtedly one of Duns Scotus's best-known metaphysical tenets. According to Trombetta, who closely follows the Subtle Doctor on this point, the concept of being is univocal. The main argument, which Trombetta recalls with the purpose of justifying this allegation is the classic argument *de dubio et certo*, i.e., the main argument that Duns Scotus developed in Book I, distinction 3, of his commentary on the *Sentences* (Scapin 1966, pp. 506–507). Unlike Duns Scotus, Trombetta shifts the doctrine of univocity of being within a “realistic” paradigm, sensitive to the suggestions of Renaissance Platonism. While Duns Scotus ascribes a conceptual character to the univocity of being, Trombetta interprets the *natura entis* as a true common *realitas* (which, nonetheless, he never understands as a genus, in accordance with Aristotle's teaching).

Trombetta's interest in ontological topics does not only appear, however, in his *Quaestiones metaphysicales*, where he deals with the interpretation of Aristotle's *Metaphysics*. In a way, this interest is even more apparent in his *Tractatus formalitatum*, published several times (albeit with different titles) between 1502 and 1586. In this treatise, which qualifies as a commentary on the *Formalitates* by the Parisian Scotist Antoine Sirect, Trombetta elaborates an authentic ontology based on the new conceptual vocabulary

developed by Duns Scotus and by his first followers (among whom stand the names of Petrus Thomae, Antonius Andreae, and Ioannes Canonicus). In this work, Trombetta deals mainly with the notions of *formalitas* and *modus intrinsecus* (Marrone 2018, pp. 35–86), the different kinds of distinction, the existing relationship between “being” and “thing” and the possibility (which he denies) to include beings of reason in the subject of metaphysics. In his inquiry, Trombetta does not limit himself to examining the new (Scotistic) lexicon of ontology but takes up some topics that he had already dealt with in his *Quaestiones metaphysicales*. Among these, the doctrine of the univocity of being is still of primary importance. Indeed, even in this work, Trombetta assigns a rigorous metaphysical significance to this doctrine. He understands the concept of being that is univocally predicated on all its inferiors as a “shared reality.” In the context of this realistic interpretation of univocal predication, Trombetta proposes a fundamental reworking of the distinction between *realitas subiectiva* and *realitas obiectiva* (Marrone 2008, pp. 290–297; Marrone 2013, pp. 203–218), which was first developed in the fourteenth century by Petrus Thomae and Ioannes Canonicus (alias Franciscus Marbres). *Realitas obiectiva*, in Trombetta’s view, constitutes the proximate foundation of univocal predication. Indeed, it designates that peculiar kind of reality, proper to conceptual objects, in which different and dissimilar things can univocally agree (Marrone 2018, pp. 70–153).

Trombetta also dealt with the Averroistic doctrine of the unicity of the intellect. This interest in the interpretation of Averroes’ monopsychism dates back to the last decade of the fifteenth century when Trombetta published his *Tractatus singularis contra Averroistas de animarum humanarum pluralitate ad catholice fidei obsequium* (Venice 1498). The motivation behind this work was primarily polemical: Trombetta’s *Tractatus* aimed to satisfy the need to stem the discussions that were animating the University of Padua in the last quarter of the fifteenth century. In 1480, a lively debate broke out regarding the Averroistic doctrine of the unicity of the intellect.

The discussion was instigated by Nicoletto Vernia who, in his *De divisione philosophiae*, and a now-lost treatise on the intellect, had explicitly sided in favor of Averroes’ monopsychism (Poppi 1964, pp. 104–106). Vernia’s thought on this topic (shared by other Averroists) was opposed by Trombetta, who contested at least two assumptions: firstly, the statement that the soul is not the substantial form of the body; and secondly, the claim that there is only one possible/passive intellect. In Trombetta’s mind, any alternative to the traditional explication is philosophically unsustainable. To affirm, as Vernia did, that the intellect refers to the body in the same way that a separate intelligence relates to the heaven it moves, means for the Paduan Scotist to provide an improper explanation of the substantial union. In his mind, the relationship between the intellectual soul and the body is much more intimate and radical than the wholly extrinsic relationship existing between the mover and the moved (Poppi 1964, pp. 113–114). Consequently, the only possible explanation for this relationship is for him that the intellectual soul is the substantial form of the body, infused by God in the *corpus ultimate organizatus et dispositum*. In the same way, the thesis affirming the unicity of the intellect is not even tenable. Since the intellectual soul is attached to the body, it can only be individual. This does not imply, however, that the intellectual soul corrupts itself together with the body, or that God cannot create the soul without the body, but only that, when God creates the intellectual soul, He creates the soul and the body *concomitantly*.

Accordingly, the unity between the intellectual soul and the body does not in any way compromise the immortality of the soul itself. Ultimately, it should be pointed out that in this inquiry about the intellectual soul, Trombetta not only opposes the Paduan Averroists but also takes a stand, at least on one point, against Duns Scotus himself. Unlike the Subtle Doctor, Trombetta maintains the possibility of proving the immortality of the soul by certain arguments and justifies his view by accurately responding to the objections that Duns Scotus had elaborated in refuting such a scientific demonstrability (Poppi 1964, pp. 114–115).

Impact and Legacy

Trombetta exerted a significant influence both on the history of metaphysics and on sixteenth- and seventeenth-century Scotism. His name appears in a large number of treatises and textbooks on metaphysics, such as the *Disputationes metaphysicae* by Francisco Suárez (Suárez 1597, 1861, passim), the *Rerum metaphysicarum libri tres* by Martin Meurisse (Meurisse 1623, p. 91b and passim), and the *Philosophiae ad mentem Scoti cursus integer* by Bartolomeo Mastri and Bonaventura Belluto (Mastri and Belluto 1678, passim). Trombetta's fame, however, is mainly linked to his *Tractatus formalitatum*. Printed repeatedly between 1502 and 1586, it became, over time, a reference textbook, in which students and teachers could find a synthesis of the Scotistic approach to metaphysical-ontological issues. As a result, Trombetta gave rise to a new current or philosophical trend within the Scotist tradition, generally remembered under the name of "Formalism." Among his main admirers and followers, albeit numerous, it is at least worth mentioning Giovanni Vallone (Ioannes Vallonis a Iovenatio), the author of *Lectura absolutissima in Formalitates Scoti* (Venice 1588), and Francesco Pitigiani d'Arezzo (Franciscus Aretinus), who wrote *Expositio exactissima, atque absolutissima Identitatum, et Distinctionum (quas Formalitates vocant) M. Antonii Sirecti Doct. Paris. secundum doctrinam Doct. Subtilis Scoti* (Venice 1606).

Tropes in Renaissance Rhetoric

Javier Patiño Loira

University of California, Los Angeles, CA, USA

Abstract

A trope is the transfer of a word from its usual meaning to a different one, justified by a relation of similitude, or of another kind, between the two meanings. Early modern students of

grammar and rhetoric memorized the tropes and learned how to identify and use each of them through the use of widely reprinted ancient and contemporary manuals of rhetoric, as well as publications dealing exclusively with tropes, such as those by Despauterius, Mosellanus, and Susenbrotus. In practical terms, tropes stood out as crucial ingredients of the ornament of style, and as such, they were central to the way literate individuals would speak and, especially, write. Furthermore, from a theoretical standpoint, tropes were a catalyst for crucial developments in early modern linguistic and aesthetic thought. On the one hand, they provided a window to the mechanisms through which language works, opening as they did a distinction between literal and figurative meaning. On the other, tropes (and especially metaphors) attracted great attention as the locus of coalescence between cognition and pleasure and became, therefore, touchstones for the development of a theory of the beautiful.

Heritage and Rupture with the Tradition

A trope is the transfer of a word from its usual meaning to a different one, justified by similitude, as in the case of metaphor, or by some other relationship, such as part to whole, cause to effect, and so on.

While early modern grammarians considered tropes acceptable deviations from convention, logicians saw them as sources of equivocation (Green 1999; Ashworth 2007). For rhetoricians, in turn, tropes were sources of the orator's artifice, a license granted to poets with even greater freedom.

At the time, children learned tropes in grammar school following the basics of morphology and syntax, only to meet them in more depth when studying rhetoric at a later stage of their education. They learned each trope by heart, including its name, definition, and examples (Green 1999; Mack 2011). Teachers pointed to tropes as part of their commentary on any work and considered them necessary to the understanding of the text and the artifice of the author (see Susenbrotus 1562). Students found the tropes in ancient and

contemporary manuals, usually paired with the figures or *schemata* (see Green and Murphy 2006 for the number of editions and reprints). Along with the sections on tropes in *Rhetorica ad Herennium*, Quintilian, or the grammarians Donatus and Diomedes, the recently discovered manuals of tropes by Rutilius Lupus, Aquila Romanus, and Julius Rufinianus went into print between 1519 and 1521. They shared a market with an increasingly noticeable presence of contemporary manuals on the same subject. After Erasmus of Rotterdam's *De copia* (1512), a series of handbooks dealing exclusively with tropes circulated from hand to hand and helped build a certain consensus due to the tendency of the authors of these books to rely on one another (Mack 2011). Manuals, such as those by Johannes Despauterius (1512), Peter Schade "Mosellanus" (1516), Johannes Susenbrotus (1540), or, in the context of Jesuit education, the section on tropes in Cipriano Soares' *De arte rhetorica* (1568), tried to stand out by means of new distinctions and examples, as well as by easing the task of memorization by organizing the tropes under headings. In 1521, Philip Melanchthon reduced them to seven, and in 1548 Omer Talon identified only four: metaphor, synecdoche, metonymy, and irony (Mack 2011). The interest in the methods used in crafting a trope led Giulio Camillo Delminio to adapt the method of invention, originally intended for the discovery of arguments, to the subject of tropes (Camillo Delminio 1970–1974).

Familiarity with tropes was a fixed component of early modern literacy that influenced the way people read and wrote and fostered inquiry into the way language works (Mack 2011). Contemporaries noticed that tropes often became naturalized, playing a role in the transformation of language, and embodying the historically contingent nature of the mechanisms governing it (Cummins 2007). Emphasis was placed on the need to not excessively strain the relation between the two meanings, where the transfer of words takes place. Analogies that were too far-fetched were perceived as inappropriate and harsh or even cold and would lead to a weakened effect upon the reader. This was important insofar as tropes were intended to stir the feelings of the audience in the quest for persuasion. However, in the wake of the

rediscovery of Aristotle's *Rhetoric* and *Poetics*, the ability of tropes (and especially metaphor) to illuminate similarities while producing pleasure came to embody the coalescence of cognition and aesthetics. While some scholars followed Aristotle's assertion that the pleasure of metaphor results from the rapid apprehension of the similitude underlying the metaphor, others claimed that readers enjoy metaphor because they see themselves cooperating through the effort involved in understanding it (see, for instance, Piccolomini 1572). This was characteristic of a trend (generally labeled with such names as "wit" or "concettismo") that peaked around the mid-seventeenth century and conceived of pleasure taken in tropes as a manifestation of self-love that readers experience as a result of their ability to understand. With pleasure defined by challenge, polemic served to further carry a trope's limits of acceptability, as authors felt encouraged to render the intellectual process of detecting relations among things more demanding.

Turks, Renaissance Image of

Lies Verbaere
Ghent University, Ghent, Belgium

Abstract

This entry offers an overview of Europe's image of the Turks during the Renaissance.

Various interactions, from military conflict to peaceful contact, engendered numerous writings about the Turks. After the Fall of Constantinople (1453), Europeans predominantly called for a crusade until a balance of power was established. Interest in Oriental characters and motifs grew from the seventeenth century onwards. Europeans held diverse views with regard to the Turks, the most influential of which were developed by Erasmus (pacifism), Luther (call for a crusade), and Machiavelli (political analysis of the Ottoman Empire). The entry indicates some geographical trends regarding these currents and touches on some ongoing debates between scholars.

Synonyms

[Ottomans, Renaissance Image of](#)

Heritage and Rupture with the Tradition

Europeans became increasingly interested in the Ottomans after the Fall of Constantinople (1453), the capital of the Eastern Roman Empire. In addition to the eastward expansion, the Turks advanced westward. Especially under Sultan Suleiman the Magnificent (r. 1520–1566) Europe felt this peril, which the battle of Lepanto (1571) symbolically averted. After the Ottoman defeat at Karlowitz (1699), exoticism gradually replaced fear.

Humanists like Enea Silvio Piccolomini lamented Constantinople's downfall. He continually called for a crusade, as did many other humanists throughout the centuries. In contrast to Piccolomini's view, his contemporary Michael Critovoulos wrote about the Turks in a more positive light. This mixture of dislike and admiration characterized Europe's view, though it must be noted that Europeans who praised the Turks often did so in order to criticize their own society (Pedani 2010, 69; Formica 2012, 4–6; Pippidi 2012, 63). Although the dominant discourse was one of conflict, countries such as France or Hungary formed alliances with the Ottomans when convenient. Norton (2013)

notes that Europeans and Ottomans shared the Mediterranean area, forging political, intellectual, artistic, and commercial contacts. Sultan Mehmed II (r. 1451–1481), for example, attracted Western philosophers (Akasoy 2013). Nonetheless, Trivellato (2010, 153–154) warns that Westerners did not necessarily form a favorable opinion about the Turks merely because they traded with them.

Europeans produced countless texts in which the Turks figured, including epics, historiography, prophecies, and suchlike. Medieval writings propagated crusades against the ‘infidel scourge’ said to be sent by God to punish Christian sins – an idea which later on Protestants, in particular, would entertain. Humanists developed more secular views. Some scholars acknowledge that medieval themes persisted but insist that the ‘Turkish barbarian’ is a humanist novelty (Hankins 1995, 121–123; Bisaha 2004, 42–44), while others maintain that humanists recycled medieval ideas (Daniel 1962, 271–307; Schwoebel 1967, 147–148; Meserve 2008, 149–154). Bisaha (2004, 77–78) claims that the term ‘barbarian’ arose from a Western sense of superiority and was increasingly applied to Muslims. Others assert that representations of wicked Turks sprang up, not from a sense of superiority but from fear of being conquered (Vitkus 1997, 146–147; Lohse 2010, 199–200). Meserve (2008, 10–12) stresses that humanists lauded certain Islamic empires that they considered possible allies against the Turks.

Bisaha (2004, 186) perceives three humanist currents: relativism and admiration; a call for understanding; and negativism. These are perceptible in the writings of Niccolò Machiavelli, Martin Luther, and Desiderius Erasmus, who were the most influential Renaissance thinkers on the Turks. (For Renaissance views, see Evans 1970; Brecht 2000; Jankovics 2000, 268–269; Malettké 2000; Soykut 2001; Maclean and Matar 2011; Pippidi 2012; von Martels 2013, 175–177; Malcolm 2013; Biasiori and Marcocci 2018.) Machiavelli’s political analysis of the rise and fall of states was applied to the Turks and notably used by Italians, Spaniards, and Frenchmen to interpret their failures and successes in confrontations with the Turks. Luther’s later writings

continued the call for a crusade, influencing his German and Hungarian followers. In contrast, Erasmus advocated peace. His irenic position partly originated in Neoplatonism, which was traditionally tolerant (Bisaha 2004, 171) and was especially adopted in Poland, Spain, Portugal, and Bohemia. While Pippidi (2012, 117) states that from the 1550s onwards the direct threat abated and Erasmianism gained European influence, Bisaha’s assertion (2004, 174–179) that sixteenth-century authors depicted the Turks negatively and at best combined Erasmus’s relativism with calls for a crusade, challenges Pippidi’s view. Pippidi (2012, 3) notes that Europeans fostered increasingly ambivalent and nuanced views about the Ottomans, especially after Lepanto; however, Pedani (2010, 73) and Formica (2010, 174–176) assert that besides relief, European writings still expressed hate and contempt. Some – especially in France, Italy, and Spain – combined Erasmian and Machiavellian ideas. There was no homogeneous European view of the Turks, as, for example, Evans (1970) shows: while many Bohemian intellectuals supported irenicism, others expressed anti-Turkish sentiments. The seventeenth century witnessed the emergence of a balance of power, and in 1634, Henry Blount wrote that “[t]he Turks are the only moderne people great in action,” (cited in Pippidi 2012, 183) which indicates a new perspective on the Turks; and, indeed, the gathering of information about the Turks, exoticism, and antiquarianism characterized Europe’s later attitude. Pippidi (2012, 138–149, 172–175, 183–184) regards England as an exception: medieval views persisted longer, and the English hardly felt the need for a crusade. Until the 1550s, the English were not interested in the Turks but became more familiar with them especially in the 1600s, resulting in the kind of new view expressed in Blount’s statement.

Christian slaves, converts, and travelers like Blount recounted both negative *and* positive stories. This did not necessarily imply that stereotypes were abandoned. While some scholars claim that traveling had a decisive impact (Pippidi 2012, 210 n. 126, for Kafé 1971, Warnier 1955, Delumeau 1970, and MacLean 2004), others take a more moderate view. Rouillard (1938,

354–356), for example, asserts that travelers' observations were not very influential and that a traveler like Guillaume Postel even sympathized with the Turks while advocating a crusade. Bisaha (2004, 180–181) even claims that travelers reinforced stereotypes and were blind to the positive aspects of the 'Other' they encountered, a view that is relativized by Parker (1999) and MacLean (2004) (Brummett 2013, 70). Others downplay the role of travelers, stressing instead the increasing importance of diplomacy (Pippidi 2012, 54–55; von Martels 2013).

Tyard, Pontus de

Born: 1521/1522, Bissy-sur-Fley

Died: 1605, Bragny

Anne-Pascale Pouey-Mounou
Université Charles-de-Gaulle – Lille 3,
Villeneuve d’Ascq Cedex, France

Abstract

Pontus de Tyard, a scholar of encyclopedic learning and a bishop (Chalon-sur-Saône), was a Petrarchist and Platonizing poet, associated with the “Lyon School” and the “Pléiade,” and a theoretician of poetry, music, and the sciences. He was, like Peletier du Mans, particularly interested in mathematics and in the potential of French as a literary and scholarly language.

In his poetry, Tyard successively sings the praises of two mysterious muses, linking human to divine love (*Erreurs amoureuses*

[1549–1555], *Vers liriques* [1552–1555], *Nouvell’œuvres poetiques* [1573], *Douze fables de fleuves ou fontaines* [1585]). In his scientific work, he investigated a series of knowledge areas and their applicability to issues of faith, the philosophy of language, and political thinking. He translated Judah Abrabanel’s *Dialoghi d’amore* (León, Hebreo, 2006) in 1551, and composed six *Discours philosophiques* (1552–1558), the *Solitaire premier* (on poetic frenzy), the *Solitaire second* (on music), the *Discours du temps, de l’an et de ses parties* (on time), *L’Univers* (*Premier* and *Second Curieux*, on cosmology), and *Mantice* (on astrological divination), and later he wrote some more treatises on science, faith, onomastics, and political writings.

He was an active member of two academies – the *Académie de poésie et de musique* presided by Baïf (under Charles IX) and the *Académie du Palais* (under Henry III). He contributed to contemporary debates around music and its primacy, the legitimacy of human curiosity, and the conception of language, in an allusive, dialogic way.

Biography

Born into the Burgundian aristocracy, Pontus de Tyard, a scholar of encyclopedic learning, entered the priesthood (Bishop of Chalon-sur-Saône). He was a Petrarchist and Platonizing poet, associated with the “Lyon School” and the “Pléiade,” (Saulnier 1948, Kushner et al. 2008) and a theoretician of poetry, music, and the sciences.

In addition to his links with the great poets of his time, Tyard was, like Peletier, interested in the sciences, particularly mathematics, and in the potential of French as a literary and scholarly language (Kushner 2001). In his religious functions, he was independent during the Counter-Reformation, as a Gallican and a shrewd politician, for example, when the League seized power in Chalon after the assassination of the Duke of Guise. Following a polemic with some Jesuits (Father Charles Suger), he resigned his office in

1593, devoting the rest of his days to study (Kushner 2001).

In his Petrarchist and Platonizing poetry, Tyard sings the praises of a mysterious Pasithée and then later extols a different muse, probably Claude-Catherine de Retz. His poetic oeuvre includes the three books of the *Erreurs amoureuses* (1549–1555), the *Vers liriques* (1552–1555), the *Nouvell'œuvres poetiques* (1573), the *Douze fables de fleuves ou fontaines* (1585, Marek 2006), and occasional verses in Latin. His motto, *Amour immortelle* (“Immortal love”), links human to divine love.

Tyard translated Judah Abrabanel's *Dialoghi d'amore* (León, Hebreo 2006) and composed six *Discours philosophiques* (1552–1558): the *Solitaire premier* (on poetic frenzy, Baridon 1950); the *Solitaire second* (on music, Yandell 1980); the *Discours du temps, de l'an et de ses parties* (on time); *L'Univers*, comprising the *Premier* and *Second Curieux* (on cosmology, Lapp 1950) and *Mantice* (on astrological divination, Bokdam 1990); later he wrote *Ephemerides octavae sphaerae* (1562), *De coelestibus asterismis poematum* (1573), some *Homilies* (1585–1586), a treatise on onomastics (*De recta nominum impositione*, 1603), some *Annotationes in libros Philonis Judaei*, and some political writings (1604). He thus investigated a series of knowledge areas and their applicability to issues of faith, the philosophy of language, and political thinking (Roudaut 2008, Bokdam 2003).

Tyard was an active member of two academies – the *Académie de poésie et de musique* presided by Baïf (under Charles IX) and the *Académie du Palais* (under Henry III) – and his contributions to contemporary debates drew on a vast range of ancient and modern sources, including Boetius, Gafurio, Glarean, Alessandro, Champier, Pico della Mirandola and Ficino, Plotinus, Lucian, Peucer, Origen, Melanchthon, and Cardano, as well as exegetical, ecclesiastical, and lexicographical works (Kushner et al. 2004–).

The *Solitaires* discusses the theurgic effects of music, the workings of the universe as musical harmony, and the primacy of music within the

hierarchy of knowledge. The *Universe* and *Mantice* examine human curiosity, its legitimacy, and modes of operation. Tyard's work, which throughout displays humanist confidence in humankind, is varied, allusive, and dialogic, making it difficult to circumscribe. He brings an extra dimension to contemporary debates by juxtaposing different systems – for example, the debate in *Mantice* on divination conflicts with his own *Premier Curieux*, which affirms man's vocation for knowledge (Bokdam 1990). Lastly, in his conception of language, he espouses a “second Cratylism” (Kushner et al. 2004–), which is closer to Plato's Socrates than to Cratylus himself.

Unicity of Intellect

Tomáš Nejeschleba
Centre for Renaissance Texts,
Department of Philosophy, Faculty of Arts,
Palacky University Olomouc,
Olomouc, Czech Republic

Abstract

The concept of the unicity of the intellect emerged in association with interpretations of Aristotle's theory of the soul distinguishing between the agent and the possible intellect. The term monopsychism is connected with the controversy, which arose in the Middle Ages with Averroes' (Ibn Rushd) commentary on Aristotle. Averroes considers not only the agent intellect but also the material (possible) intellect as transcendent and numerically unified. Thomas Aquinas and other Christian thinkers criticized this doctrine because it negates the concept of an individual immortal human soul. In the fifteenth century, the unicity of the intellect was often viewed as an interpretation fully in agreement with Aristotle's theory of the soul, and the doctrine is usually found in Renaissance Paduan Peripatetic philosophers, beginning with Paul of Venice and ending with Nicoletto Vernia. Criticism of the doctrine (particularly by Marsilio Ficino) influenced, however, the Church reaction and led to the condemnation

of monopsychism at the Fifth Lateran Council in 1513. The anti-Averroist attitude began to prevail in the sixteenth century. As a result of Pietro Pomponazzi affair, the subject of discussion shifted from the relationship of plurality versus unicity to the issue of immortality versus mortality. Monopsychism consequently declined both as a philosophical doctrine and as a viable interpretation of Aristotle in the second half of the sixteenth century.

[Monopsychism](#)

Heritage and Rupture with the Tradition

Aristotle in *On the Soul* (Aristotle 1961, 3.5.430a) distinguishes between two types of "intellect" – one that "becomes all things," i.e., is able to assume all forms, and the other which is capable of making forms actual in the mind. Aristotle does not further specify the latter type of intellect that in the subsequent tradition understood as the agent intellect (*intellectus agens*), unlike the first type which is usually referred to as the material intellect (*materialis*), or the possible intellect (*possibilis*). The aforementioned passage of Aristotle's *On the Soul* inspired his Greek commentators to produce various interpretations of the ontological status of the first or the second

intellect. Although the unicity of the agent intellect was adopted by a number of Greek (Alexander of Aphrodisias, Themistius), Muslim (Avicenna), and Christian medieval philosophers (Dominik Gundisalvi), a major controversy did not arise until the unicity was also attributed to the possible (material) intellect. In his *Long Commentary* to Aristotle's *On the Soul*, Averroes (Ibn Rushd) describes not only the agent intellect but also the material (possible) intellect as transcendent and numerically unified, considering it the last nonphysical substance. For many Christian thinkers, the implications of this doctrine on the unity of the possible intellect, called monopsychism, were unacceptable. Monopsychism was in conflict with the concept of an individual immortal human soul, since according to Averroes, what is individual and intrinsic to humans, i.e., the so-called passive intellect (*intellectus possibilis*), ceases to exist together with the body, whereas the possible intellect, made actual by the agent intellect, is immortal, but unified, like the collective reason of all of mankind, which in every single individual works so that it uses its notions in order to abstract the ideas therefrom.

Averroes articulated three main arguments in support of the unicity of the possible intellect:

1. If the material intellect (*intellectus materialis*) is multiplied according to the number of individual men, it would be an individual thing – *hoc aliquid* – a body, or a power in a body. However, *hoc aliquid* is a concept of the mind that only exists as a possibility. And this concept of the mind in potency is the subject of the material intellect. This implies that the material intellect would serve as its own subject, setting itself in motion and knowing itself, which is impossible (Averroes 1953, p. 402).
2. If the material intellect (*intellectus materialis*) was multiplied according to the number of individual men, knowledge would also be endlessly multiplied. Your and my knowledge of the same object would be numerically different although, as regards its nature, it represents an identical object, which is nonsense (Averroes 1953).
3. It would not be possible for students to learn something from their teachers. The teachers' knowledge would have to have the power to affect and produce students' knowledge (Averroes 1953, p. 411).

Thomas Aquinas, in contrast, in his *De unitate intellectus contra Averroistas* contests Averroes' interpretation of Aristotle and rejects not only the unity of the possible intellect but also the unity of the agent intellect. According to Aquinas, the intellect is one of the faculties of the individual soul which is a form of the body. The theory of the unity of the intellect would contradict the fundamental experience underpinning Aquinas's argument that individual human beings do in fact understand (Aquinas 1976).

Following Thomas Aquinas, the doctrine on the unity of the possible intellect became the basic characteristic of Averroism. Despite the fact that Aquinas in his day gave rise to the "phantom of Latin Averroism" (Marenbon 2013), a number of philosophers in the fifteenth and sixteenth century in one way or another advocated the unicity of the intellect and were therefore known as "Averroists" (Martin 2013, 2014).

Innovative and Original Aspects

Advocates of Monopsychism

Averroism was traditionally discussed during the Renaissance at the University of Padua. The first advocates of monopsychism in the Renaissance allegedly included Paul of Venice. According to him, the possible intellect that becomes all things, i.e., understands the universals that are immaterial and eternal, has to possess these qualities. Being of an immaterial nature, it has to therefore be unique since a multitude arises from matter (Nardi 1958; Kuksewicz 1983). At the same time, Paul of Venice conceived the intellect as the substantial form of the human body, i.e., intellect was not connected with the body merely in the sense of activity, but also infused it with essence. This notion is close to Thomas Aquinas and seems to be in opposition to monopsychism (Conti 1992).

The thoughts of Paul of Venice were further elaborated by Gaetano da Thiene, who, however, rejected Averroes' monopsychism. Although, according to Gaetano, the unicity of the intellect enables us to understand the general, if the intellect does not pertain to humans as a substantial form, it is impossible to define man as a rational being (Kessler 2008).

Unlike Gaetano, a number of philosophers associated with the Paduan school were propagators of the Averroist doctrine. Although Niccolò Tignosi sided with Thomas Aquinas and adopted his doctrine on the soul as a substantial form, he believed that the true character of the doctrine on the unicity of the intellect depended on the "opinion of the faith" (*opinio fidei*). Rational arguments supporting the plurality of immortal souls are viewed as too weak, and, therefore, in relation to the natural intellect, Averroes' unicity theory must be approved (Hasse 2004a).

Johannes Argyropoulos in his commentary on *De anima* openly acknowledges Averroes' understanding of the agent intellect as a single and separated entity and also the unicity of the possible (material) intellect and finally even the concept of the mortal "passive" intellect (Monfasani 1993).

Like his predecessors, Elia del Medigo elaborated on Averroes' commentary on Aristotle's teachings in his two *Tractates on the Soul*. Averroes' possible intellect is originally considered a mere disposition which is, however, gradually becoming an immaterial substance as it approaches the separated active intellect until the final unification (Bland 1995). Del Medigo interprets the relationship between the possible and agent intellects with reference to the Kabbalist tradition that culminated in a mystical unicity.

Del Medigo's pupil, Giovanni Pico della Mirandola, in his *Conclusiones* (1486) consequently presents 900 theses encompassing different philosophical traditions aiming to bring them in agreement, including Averroes' statement: "There is a single intellective soul for all humans" (Farmer 1998). Pico della Mirandola was convinced, however, that the theory of the unicity of the intellect was compatible with the immortality of the individual soul. This was

described by Pico della Mirandola as the unicity of the intellect with the separated intellect in the state of happiness (Still 2008).

The term "Averroism" is most often attributed to Nicoletto Vernia thanks to his tractate on the substantial unity of the human intellect (*Utrum anima intellectiva humano corpore unita*). In this work, Vernia defends Averroes' monopsychism as the only correct interpretation of Aristotle's psychology. Vernia believed that efforts by Aquinas and other medieval authors to assert the doctrine of the individual soul as a substantial form of the human body, separable from the body after death, were completely alien to Aristotle's thought. Conversely, Peripatetic thought, supported by Averroes' interpretation, postulates the intellective soul to be eternal and not multiplied, since immaterial entities are not subject to individuation (Mahoney 2000). For Vernia, the possible intellect is eternal and eternally connected with the agent intellect, i.e., as a separate substance possessing eternal intellectuality (Hasse 2004b).

Vernia's teachings represent the climax of the doctrine on the unicity of the intellect in the fifteenth century. Vernia and additional fifteenth-century thinkers viewed Averroes' concept of the possible intellect as a single, separate, superindividual substance as an interpretation fully in agreement with Aristotle's doctrine on the soul. This doctrine was at the same time in contradiction with the Christian belief in the immortal, individual human soul.

Criticism of Monopsychism

Opponents of monopsychism during the Renaissance were primarily thinkers who followed up on the teachings of Thomas Aquinas or who directly drew on his legacy. As one of their sources, they could have relied on the decree of the Council of Vienne (1311–1312) which banned the theory that the intellective soul was not a substantial form of the body and declared it a heretical doctrine, thus supporting the Thomist concept.

Aquinas's argumentation against the unicity of the intellect also inspired Nicolaus Cusanus whose *Idiota de mente* (Cusa 1983) explicitly

criticized the doctrine perpetuated by “some Peripatetic” about “a single intellective soul.” Cusanus rejects the unicity of the intellect on the grounds of the proportionality of the individual soul and the human body. Since the identity of the proportion cannot be multiplied, the identity of the mind animating the body in an adequate proportion cannot be multiplied either. Cusanus therefore inferred that it was impossible for all humans to share the same intellect. Similar to Thomas Aquinas, Nicolaus Cusanus condemned monopsychism for its inability to explain the experience of the individuality of thinking. His arguments are underpinned by the concept of the soul as an essential form of humans or Aquinas’s concept of the intellect as the capability of the soul which is a substantial form of the human body (Führer 2014).

Numerous Renaissance Platonists were critical of the doctrine of monopsychism. In his *In calumniatorem Platonis*, Cardinal Bessarion saw a difference between interpreting Aristotle in the sense of Alexander of Aphrodisias’ rejection of immortality and Averroes’ refusal of individuality. Given the eternal nature of the world, if we want to retain individuality and avoid Alexandrian mortality, we either have to adopt the doctrine on transmigration of the souls (metempsychosis) or the infinite number of souls. These contradictions may be resolved by means of Averroes’ postulation of a single intellect common to all. According to Bessarion, monopsychism thus presents an adequate interpretation of Aristotle’s philosophy, although it fails to stand the test of Christian faith, and needs to be replaced by Platonism which, unlike Aristotelianism, is in harmony with the Christian faith (Martin 2014).

Monopsychism was contested by Marsilio Ficino, who dedicated the entire 15th volume of his *Platonic Theology* (*Theologia platonica de immortalitate animorum*) to Averroes’ doctrine. Ficino points to the absurd consequences that would stem from the unicity of the possible and the agent intellect (Allen 2013). Ficino finally resorted to an eclectic formulation: adopting the concept of the immortality of the

possible intellect from Averroes’ teachings and the multiplicity of souls from Alexander of Aphrodisias. Ficino refuses to regard matter as the principle of individuation, which prevents him from sliding into one of the extremes and for the Christian faith unacceptable interpretations of Aristotle’s doctrine of the intellect. If the intellect is not individualized by matter, it loses both its immortality, which would have stemmed from its connection with the body, and its Averroist superindividuality and unicity of the eternal intellect separate from matter (Blum 2007).

It was presumably the effect of Ficino’s criticism of Averroism (Randall 1961) that led the Bishop of Padua, Pietro Barozzi, in May 1489 to issue a decree forbidding public debates on the Averroist doctrine on the unicity of the intellect. In response to the condemnation of monopsychism, Nicoletto Vernia produced the tractate *Against Averroes’ Perverse Opinion on the Unicity of the Intellect* (*Contra perversam Averrois opinionem de unitate intellectus*) in which he reviewed his original Averroist approach. Vernia here claimed that although he lectured on Averroes’ monopsychism, he saw it only as a dialectic exercise, and he himself was not an advocate of the monopsychist doctrine. In his new tractate, he not only opposed Averroist arguments, but even attempted to demonstrate the individuality of the immortal human soul (Hasse 2004b).

The publication of Barozzi’s decree was shortly followed by an anti-Averroist tractate by the Franciscan and Scotist Antonio Trombetta. Despite the anti-Averroist character of the treatise, Trombetta believed Averroes’ theory on the indestructibility of the soul to be congruent with Aristotle’s teachings as well as with Christian faith. Trombetta intended to support both the eternal nature of the intellect understanding universals and the plurality of the intellect (Blum 2007).

Aristotelian thinkers found the rejection of the Averroist unicity of the intellect problematic. In his *Quodlibeta de intelligentiis* published in 1494, Alessandro Achillini still

viewed Averroes' interpretation of the intellect as the correct approach to Aristotle's problem. Although he accentuated the fact that the doctrine on the unicity of the intellect contradicted the faith and also had to be disputed by means of philosophical arguments, he also employed pro-Averroist arguments. If the possible intellect would be multiple in its nature, it would be impossible, due to its individuation, to distinguish it from sensory perception, and it would be impossible to obtain knowledge of universal forms. Achillini rejected in the end the unicity of the intellect, although it seemed probable in philosophical terms, and the philosophical arguments raised against this theory were insufficient (Hasse 2004b).

Vernio's students Agostino Nifo and Pietro Pomponazzi similarly admitted in their early works that Averroist monopsychism appears to be the right interpretation of Aristotle which is difficult to refute. In his commentary on Aristotle's *De anima*, Agostino Nifo expounded on Averroes' monopsychism applying cosmologic terms, i.e., referring to a heavenly sphere, which he identified with the human intellect, and yet considering this doctrine unacceptable for Christian believers. As early as 1503, however, he published *De intellectu*, in which he rejected the entire doctrine. He does not rely on psychological and epistemological counterarguments, however, as those were not found convincing, but formulated objections drawing on ethical philosophy and religion as well as on arguments derived from natural philosophy and cosmology (Hasse 2004a, b).

It seems that even Pietro Pomponazzi in his early commentaries on Aristotle regards monopsychism as a legitimate interpretation of Aristotle. He paraphrases Averroes' position, confronting it with the explication by Alexander of Aphrodisias, i.e., with the plurality of individual mortal intellects. Averroes' doctrine on the soul is considered congruent with Aristotle's teachings, but useless and therefore not worth following. Alexander's interpretation of Aristotle's text did not prevail in Pomponazzi's argumentation until the 1520s (Pluta 1986; Van Dooren 1994).

Impact and Legacy

The oscillation of many philosophers between Averroist monopsychism on the one hand and Alexandrian emphasis on plurality at the cost of rejection of immortality on the other became one of the issues addressed by the Fifth Lateran Council. The bull *Apostolici regiminis* issued by Leo X on 19 December 1513 forbade the advocacy of both the Averroist and the Alexandrian position, even in the form of a mere dialectic exercise.

Pietro Pomponazzi's *Tractatus on the Immortality of the Soul* published in November 1516 caused controversy, however, due to his inclination to Alexandrianism, not Averroism. Pomponazzi rejected the unicity of the intellect, arguing in favor of the plurality of souls, to which he, however, attributed only relative immortality and absolute mortality. Pomponazzi's key argument against the unicity of the intellect was a thesis adopted from Aristotle arguing that the activity of the intellect cannot do without imagination, and it was therefore dependent on phantasmas, sensory images, produced by sensory perception. According to Pomponazzi, if the intellect is dependent on the body in terms of its activity, it depends on the body in terms of its existence, hence being individualized through the body.

The unicity of the intellect, condemned at the Council, was consequently rejected on the basis of philosophical arguments using an analysis of the process of knowledge. Thanks to Pomponazzi, the discussion subsequently shifts to a different level; the relationship of plurality versus unicity made way to the issue of immortality versus mortality. Pomponazzi himself differentiated between the agent and the possible intellect, viewing the agent intellect as an immortal and separate substance which affects the possible intellect, individualized through the body, just as the mover affects the moved. Gasparo Contarini, one of Pomponazzi's critics and advocates of the immortality of the human soul, also agreed with Pomponazzi not only in his rejection of Averroist monopsychism but also in viewing

the agent intellect as separate from the human soul (Contarini 2014). Cesare Cremonini later held the same position – on the one hand the immanency of the possible intellect and the transcendence of the agent intellect – while at the same time identifying the unified agent intellect with God (Kuhn 1996). As with Pomponazzi, Cremonini also drew on the thoughts of Alexander of Aphrodisias, similarly to Simone Porzio earlier, who, however, unlike Cremonini, rejected Alexander's identification of the agent intellect with God (Garin 2008).

One exception in the debate in the period in question, which began to be dominated by the anti-Averroist attitude, was Luca Prassicio, who defended Averroes as an advocate of the immortality of the soul both against Pomponazzi and Nifo. In his tractate on the immortality of the soul, he chose to support Averroes as the best advocate of the immortality of the soul, i.e., not only the agent but also the possible intellect. In Prassicio's theories, the problematic aspect of the concept of the unicity of the possible intellect from the perspective of Christianity curiously made way to the advocacy of the immortality of the soul, challenged by Pomponazzi (Hasse 2004b).

The second half of the sixteenth century consequently saw the doctrine on the unicity of the intellect and Averroism as a declining trend. One of the last philosophers to contribute to the topic of the Averroist unicity of the intellect was Francesco Vimercato, who in his writings on the soul arrived at the unicity of the active as well as the unicity of the possible intellect, although again, like many of his predecessors, he also claimed that this doctrine was incompatible with Christianity. The last advocate of the unicity of the intellect in terms of natural philosophy, although also emphasizing its falsity in the sense of Christian truth, was presumably Antonio Bernardi in 1562 (Hasse 2004a).

The gradual disappearance of Averroist thought in the second half of the sixteenth century also does not imply that philosophers would stop objecting to his theory. So-called

Conimbricenses and Francisco de Toledo regarded Averroes' monopsychism as a doctrine contradicting Aristotle's teachings and the true doctrine (Salatowsky 2006). The elaboration of alternative theories of intellection based on Aristotle's theories was actually the reason for a retreat from Averroist positions, both in Lutheran Germany by Philip Melanchthon and in Jesuit scholasticism (Wels 2000), represented by Francisco Suárez, or as part of Aristotelianism of Jacopo Zabarella (Hasse 2007). The last serious attack on Averroist monopsychism was in all probability formulated in the seventeenth century by Cambridge Platonists, most notably Henry More, although this critique was articulated from the Platonist perspective (Hutton 2013).

Universities in the Renaissance

Lorenzo Sacchini

University of Leeds, Leeds, UK
Fredericksburg, USA

Abstract

The earliest universities appeared in the twelfth century in Bologna and Paris. These institutions grew out of preexisting schools already established in the two cities. Bologna and Paris provided a very influential model for newer institutions, with Southern European universities conforming to the example of Bologna, while Northern European universities adhered to the model of Paris. Northern European universities gave prominence to theology and arts teaching and mostly awarded bachelor's and master's degrees. By contrast, Southern European universities concentrated on law and medicine and mostly awarded doctoral degrees; they accorded marginal importance to theology, which was generally taught in the general schools of the mendicant orders.

Gradually, universities spread throughout Europe: until the first half of the fourteenth century, they proliferated mostly in the south and west of Europe; following the foundation of Prague University in 1348, they developed in Central Europe too. At the end of the seventeenth century, approximately 60 universities were in operation in Europe. From the beginning of the seventeenth century, the growth of universities began to slow down gradually.

Renaissance European universities maintained the structure and organization of the medieval pattern. The innovation fostered, among other factors, by humanism, led to the foundation of new subjects (such as botany), to the application of humanist philological method to a wide spectrum of subjects, and to the expansion of the canon of authoritative texts. Humanists eventually took up positions in universities, becoming a driving force for

change from the fifteenth century onward. Their entry into the academic world led to serious conflicts in Northern Europe, but they were received more positively in Southern Europe. European universities exerted a profound impact on society, which was not limited to research findings applied to everyday life. The Lutheran Reformation had its origin in an academic dispute which was to be held at the University of Wittenberg, where Luther was teaching biblical studies. His links with other colleagues, as well his teaching activity, played a crucial role in the defense and dissemination of the Reformation.

Universities

The university is an institution devoted to advanced learning and research. Today, it normally comprises a college of liberal arts along with professional and science schools. It provides graduate and undergraduate programs in a range of subjects and has the power to confer undergraduate and graduate degrees in various academic disciplines. This state of affairs is the end result of a long-term evolution, which proceeded smoothly and without dramatic changes. Tellingly, Walter Rüegg has defined the university as “the only European institution which has preserved its fundamental patterns and its basic social role and functions over the course of history” (Rüegg 1992, XIX). He has also identified another crucial element of the university: its Europeaness. This is due to the influence that this institution has exercised both within and beyond European borders. Not only has it been vital for the development of European society, contributing to shaping a common cultural tradition, but its structure and organization have also been adopted in diversified societies worldwide beyond the continent's borders (Rüegg 1992, XIX–XX).

Some scholars, mostly in the field of Islamic studies, have challenged this view. They have argued that the madrasas, in fact, provided the pattern (or, more cautiously, some features of the pattern) later adopted by European universities.

Madrasas are institutions of higher education, first established in eleventh-century Iraq and still active in Muslim lands, which have represented for centuries the main source for the development and diffusion of religious and scientific knowledge throughout and beyond the Muslim world. Their teaching centers on law and theology. During the Middle Ages, they were very small schools (with just a few teachers – sometimes even just one) founded and sponsored by a wealthy patron as an act of charity. Drawing a comparison between universities and madrasas (at least, those around the Mediterranean sea), Darleen Pryds has noted significant similarities in the figure of the patron, as well as in the function of political training provided by both these institutions (Pryds 2000, 95–99). In her analysis, she explicitly rejects the opinion of George Makdisi, who, by contrast, systematically listed the fundamental differences between these two institutions. Makdisi has stressed, in particular, that the European *licentia docendi* (permission to teach) was granted by the political authorities (such as a prince, king, or pope) who funded the university, whereas the Islamic *ijāza* was conceived as a personal qualification conferred by the master on the student. Furthermore, Makdisi has highlighted that the idea of *universitas*, as originally conceived in medieval Europe, was essentially alien to Muslim society. The Latin term *universitas* meant a guild, that is, a corporation formed to provide protection and pursue the common interests of its members. Only over time did the term gradually acquire the meaning of a “society of academics.” As we will see, this concept of corporation (*universitas*) proved to be crucial for the foundation and development of European universities (Makdisi 1970, 260–264).

Both Bologna and Paris claim the honor of being the site of the first European university. The title of oldest institution is generally assigned to Bologna. According to the traditional account, the foundation of the university dates back to 1088. This date was, in fact, chosen in the late nineteenth century by a committee chaired by the then rector Giovanni Capellini. The results of the committee’s investigation were celebrated in a powerful and passionate speech given by Giosuè

Carducci (1836–1907). Famous poet and Bolognese academic, Carducci praised Bologna for its contribution to the rebirth of the ancient tradition of Roman law through its law schools and, later, university. According to his account, although it is not possible to date the birth of the university precisely, it is undeniable that it happened in the closing years of the eleventh century, making 1888 the 800th anniversary of its foundation (Carducci 1888). This effort to determine a specific date was evidently aimed at instilling a sense of pride, in the form of a certain cultural supremacy, in the people of the newborn kingdom of Italy. Contemporary scholars tend now to reject this legendary account. They instead regard the foundation of early universities as a gradual process which took place over a long period of time.

The University of Bologna grew out of the private law schools already present in the city in the last decades of the eleventh century. Numerous groups of students gathered in the city to hear preeminent jurists, such as Irnerius (c. 1050–after 1125) lecturing on civil law and later the Camaldolese monk Gratian (c. 1075–1145/1147) lecturing on canon law. Students gathered around – and paid – an eminent teacher in order to receive professional training in law. These law schools, which were attracting a growing number of students, remained private institutions until at least the second half of the twelfth century. According to Jacques Verger, “the crucial change would seem to have taken place around the years 1180–1190” (Verger 1992, 47–48). From 1189 the local government of Bologna was able to gain more control over professors, who swore an oath of loyalty to the city. The resulting stability favored the arrival of large numbers of students coming from places both nearby and distant. Foreign students, lacking legal protection, formed associations to assert their civil rights and avoid various forms of discrimination. They grouped themselves in accordance with their own place of origin and named these organizations *universitates*. Following the appearance of law schools in Bologna, teaching in other subjects gradually materialized. By the middle of the thirteenth century, philosophy and medicine had attained a strong position in the university; and

by the end of the century, arts subjects also began to be taught. The school of arts and medicine was finally recognized in 1316. Another crucial factor in the development of the University of Bologna was papal intervention. In 1219, Pope Honorius III stated that permission to teach (i.e., the *licentia docendi*) had to be granted by the archdeacon of the city. This belated recognition of a situation already in existence (as the university had awarded degrees before this papal intervention) became an important precedent for other universities in following centuries, which were founded on the basis of a charter from a pope or emperor. Similarly, another crucial decision made by the University of Bologna set a further important precedent for other European institutions. Bologna regarded the university as a “civic enterprise” to whose development the city had to contribute (Grendler 2002, 21). Indeed, in the thirteenth century, the city began to pay – despite a few interruptions – law professors’ salaries and to levy a tax on the citizenry to promote the university’s growth. The same decision was later taken by Padua in 1262. Italian and European cities sponsored universities because they could increase their cultural and political prestige and contribute to the city’s economy. Moreover, by paying for the universities’ expenses, city governments essentially gained a firmer control over these institutions, taking over the power previously wielded by students.

A very similar chronology applies to the birth of the University of Paris. From the closing decades of the eleventh century, schools began to proliferate in the French city. Alongside the traditional ecclesiastical schools, well represented by the chapter of Notre Dame, which taught theology, many private schools were established, offering a curriculum based on the arts. After 1150, law and medical schools appeared, run by Italian-educated professors. The rapid expansion of these schools raised organizational issues. Continuous strife with city dwellers persuaded students to remain under the church’s control. Students obtained the privileges of clerics, while the Church assumed direct control over the schools. Probably starting from the 1170s, these schools determined to be organized in guilds. The

first guilds of students and masters appeared between 1200 and 1210. The pope did not interfere with this trend, whereas the local bishop and chancellor, who possessed a discretionary authority over these schools, fiercely opposed it. With the support of the pope, masters and students of Paris achieved a notable victory after 25 years of hostilities. They gradually attained all the features which were essential to form a corporation. By 1215, masters were able to gain control of the enrollment in the schools and to have statutes. In 1231, Pope Gregory IX asserted once and for all the legality of the academic statute.

As indicated above, both Bologna and Paris developed spontaneously from preexisting schools. The case of Oxford University is similar, growing out of schools that were active as early as the middle of the twelfth century. A provisional form of university was already in place at the beginning of the thirteenth century before it received the first papal statutes in 1214. Sometimes the birth of early universities occurred as a consequence of a migration from another institution. The foundation of Cambridge University is the result of a migration from Oxford, which happened between 1209 and 1214; analogously, the University of Padua owes its origin to a secession of students from the University of Bologna that happened in 1222 (Arnaldi 1977). The birth of a university could also be dependent on the will of the secular or religious authority. Emperors, popes, and European sovereigns had the power to create universities and often used it. Emperor Frederick II, for instance, founded the University of Naples in 1224. Similarly, Spanish political authorities put a great deal of effort into the creation of new universities: in addition to the short-lived *studium* of Palencia, the kings of Castile were responsible for the foundations of the universities of Salamanca (1218) and Valladolid (whose date of founding is disputed) before the end of the thirteenth century.

Despite some discrepancies in the data provided by historians, it is possible to observe some trends in the foundation of universities and to draw a general outline of their diffusion. From the foundations of the first universities of Bologna and Paris until the beginning of the seventeenth

century, there was a dramatic growth in the number of universities. As we shall see, this growth saw a strong increase in the fifteenth century, followed by a slowing of pace in the last period considered here (1500–1625). The year 1650 marks the turning point in this prolonged growth: thereafter, the number of new foundations more or less equals the number of universities which were closed down, transferred, or merged. By the end of the fourteenth century, there were around 30 universities in operation (31 according to Verger 1992, 57; 29 according to Grendler 2004, 2). The majority of universities that were newly founded in this century were located in the south and west of Europe (Italy, France, and Spain). The foundation of Prague University by Emperor Charles IV in 1348, however, marked the beginning of a powerful movement for the creation of new universities in present-day Germany and in Central Europe. Not by chance, the fifteenth century saw a general increase in the creation of universities throughout Europe and a sharp rise in Germany and in Northern Europe. Germany established 15 new universities; lacking medieval institutions, Scotland created 3 universities (St. Andrews, 1413; Glasgow, 1451; Aberdeen, 1495) and Scandinavia 2 (Copenhagen, 1475; Uppsala, 1477) before the end of the century. New institutions were also founded in Spain, France, Italy, and on the eastern fringes of Europe. By 1500, around 60 universities were in operation in Europe (63 according to Verger 1992, 57; 57 according to Grendler 2004, 2) – a doubling in the course of a century. In the following period, from the sixteenth century until the first quarter of the seventeenth century, 18 new universities were established in Europe (Grendler 2004, 2). The foundation in the sixteenth century of the universities of Marburg, Helmstedt, Jena, Wittenberg, and Frankfurt an der Oder made the central-eastern area of Germany particularly fertile in such institutions.

The diffusion pattern of European universities reflects the overall economic and “cultural development of the continent” (Patton 1969, 26). Yet, this diffusion was also heavily influenced by some other major factors such as political, religious, or ideological aims. The foundation in

the sixteenth century of German universities and of French universities (Douai, 1559; Pont-a-Mousson, 1572; Besançon, 1564) run by Jesuits clearly reflects the will to back the respective religious and political causes of Protestants and Catholics. Similarly, Spanish Catholic authorities founded the University of Gandia in the newly conquered south of Spain to educate converted Moriscos and assert direct control over the area (Frijhoff 1996, 70–71). These factors might also explain the absence of universities in certain areas, for example, the populated and developed areas of the Low Countries and the Baltic where no universities were founded in the fifteenth century. This seems to have been due to the unfavorable perception of Northern European universities, modeled on the example of Paris and thus mostly oriented toward arts and theology, subjects which did not attract pragmatic Northern European merchants (Patton 1969, 18–19, 26).

The universities of Paris and of Bologna, besides their chronological priority over newer institutions, also exerted a profound influence on them. They embodied, in fact, the differing archetypes of Northern and Southern European universities (Gieysztor 1992, 109–113; Grendler 2004, 3–12; Lines 2012, 2–7). Major differences originated from their curriculum as well as their structure and organization. Southern universities concentrated on law and medicine. They adopted the two-faculty system established in Bologna, where a separate faculty in arts and medicine was formally constituted after the establishment of the law school. In these universities, theology occupied a marginal place in the curriculum and was mostly taught in the general schools of mendicant orders, which were separate institutions. By contrast, the Paris model was structured into four faculties, with arts as the lower faculty and law, medicine, and theology as the higher faculties. A successful course of study in arts was seen as preparatory for more advanced classes and was generally required in Northern European universities in order to attend any of the three higher faculties. As a result, arts faculties “were the dominant element both numerically and juridically” in these institutions, within which “they also had

the youngest and the most volatile membership” (Leff 1992, 309).

Law was the largest faculty in Italian universities, with arts and medicine equally divided between them. In Bologna, for instance, the number of law professors was consistently higher than the number of arts and medicine professors until the beginning of the sixteenth century, when the long-standing pattern was reversed (Grendler 2002, 9). It is possible to conclude that “about seventy-five percent of Italian professors taught law and medicine, another twenty percent taught arts” (Grendler 2004, 6). The remaining 5% taught theology, which acquired increasing importance in the mid-sixteenth century with the Council of Trent (1545–1563). Although some Italian universities had acquired the right to confer degrees in theology from the mid-fourteenth century, it was only in the last third of the sixteenth century that the number of theology professorships rose a little.

Whether or not universities had been teaching theology continuously since their foundations, they appointed one or more members of the clergy to theological professorships during or following the Council of Trent. It was only Padua that had a more consistent and established presence of theology in its university from the middle of the fifteenth century. The appointment of professors of metaphysics and theology was favored by inter-related interests. On one hand, the Venetian senate wanted to tackle the drop in matriculation numbers in certain areas of the curriculum of the University of Padua and to furnish it with prestigious teachers; on the other hand, students of arts and medicine had been expressly requesting a post in theology since 1433. Therefore, in 1442, the Venetian senate created a professorship of Thomistic metaphysics, which was followed in 1474 by a professorship of Scotist metaphysics. Since metaphysics was taught using Aristotle’s treatise on the subject interpreted from a Christian perspective, it was essential as preparation for the study of theology. Then, in the last quarter of the fifteenth century, the Venetian government founded two additional professorships in Scotist (1476) and Thomist theology (1490). Finally, in 1551, the Venetian senate created the first

permanent position in Sacred Scripture in Italy. In the sixteenth century, then, the University of Padua could boast the second largest presence (after Rome) of religious studies among all Italian universities. Its five professors of religious studies, out of a total average number of 56 lecturers, amounted to almost 10% of the whole professorship (Grendler 2002, 366–372).

The percentage of theology professors in Northern European universities was far higher than in Southern European ones. This is especially true for Paris and Oxford, which received an exclusive right from the pope to confer degrees in theology until the fourteenth century. Since Northern European universities showed a marked inclination for theology and arts, they awarded bachelor’s and master’s degrees, which were directly linked to these faculties, whereas Southern universities essentially conferred doctorates. The bachelor’s degree in arts was normally awarded after 4 years, while the master’s degree was conferred after 6 years in Paris and 7 years in Oxford. The degree in theology was at the top of the scale. In Oxford, in order to become a master in theology, a student had first to finish a master’s in the arts. This rule did not apply to Paris, where a student had to go through different stages in order to become a *bacchaliarius formatus* in theology; therefore, he had to continue his training for a total of 12–16 years before becoming a master. As a result of this prolonged course of studies, the minimum age for graduating as a master in Theology in Paris was 35.

Despite these differences, Northern and Southern European universities shared some key elements. Firstly, the language used throughout the medieval and Renaissance academic world was Latin. A few attempts to lecture in the vernacular were made in sixteenth-century German universities and later in other countries but did not prove to be either successful or lasting (Burke 2004, 76–78). Secondly, Aristotelian thought provided the dominant (although not exclusive) philosophical framework until the end of the seventeenth century in university learning. Thanks to its flexibility and its adaptability, it was the most suitable to accommodate new research findings. Furthermore, it seemed to

contemporaries more systematic, more rigorous, and therefore “much more didactically useful” than other alternative philosophical traditions (Bianchi 2007, 50). The third common element was the teaching method, which consisted of lectures and disputations. Lectures were of three kinds: ordinary, extraordinary, and cursory, in decreasing order of importance. Ordinary lectures were required to obtain the degree and were given by the most distinguished professors; extraordinary lectures were normally optional and were taught by less experienced professors; cursory lectures were open to the community and had an ancillary purpose in the curriculum and a more informal character. Disputations complemented lectures. Students were requested to attend or to take part in these disputations, in which the presiding master posed a question and participants were expected to back the positive or the negative side of the argument. Finally, the question was answered by the presiding master. These disputations were also designed to train students in dialectical reasoning, which lay at the heart of scholasticism.

The curriculum of European universities had much in common throughout Europe. The main differences appeared in the arts faculty, which taught a miscellaneous group of subjects from within the liberal arts. The focus was on three major fields of study: philosophical and linguistic training, providing classes on grammar, rhetoric, logic, natural, and moral philosophy; an overview of mathematical sciences (arithmetic, geometry, astronomy and music). In Northern European universities, the faculty established a close link to theology and therefore acquired a philosophical orientation. By contrast, in Southern Europe, the arts faculty in French, Spanish, and Italian universities, developed a more practical orientation and established links to law and medicine. It is no surprise, then, that until the fifteenth century, a subject with an essentially legal function such as the *ars dictaminis* (i.e., the art of writing Latin letters conforming to certain rules and models) was still included in the arts curriculum of Italian universities. Particular emphasis was also placed on rhetoric, which had value for students of the law.

University legal instruction centered on civil and canon law. Canon law was based on Gratian’s *Decretum*, a collection of papal letters, council decrees, and other ecclesiastical writings. The teaching of canon law implied the reading and the interpretation of the *Decretum* and its glosses. Canon law experienced a grave crisis in the sixteenth century due to the increasing secularization of society. Civil law was based on the *Corpus juris civilis*, a compilation of Roman law assembled by the officials of Emperor Justinian in the sixth century. After the *Corpus juris civilis* was revitalized by Bolognese glossators in the twelfth and thirteenth centuries, it was re-interrogated and interpreted by fourteenth-century commentators or post-glossators. The philosophical background used by the early post-glossators such as Cino da Pistoia (1270–1336) was provided by the application of the Aristotelian “four causes” as elaborated in the French universities of Paris and Orleans and the adoption of their dialectic method (Kelley 1979, 782–783). Within this tradition, the two major post-glossators, Bartolus of Sassoferrato (c. 1313–1357) and Baldo degli Ubaldi (c. 1327–1400), both Perugia-educated, taught in various universities in central and northern Italy. Their teachings spread throughout Europe under the name of *mos italicus*. As we will see, in the sixteenth century, the *mos italicus* was rivaled by the *mos gallicus*, which implied the adoption of a philological perspective to the study of law.

University teaching of medicine was common to many universities. The first organized European medical school was located in Salerno, in the south of Italy, and was founded in the ninth century by Benedictine monks. The *Schola medica salernitana* is generally considered the forerunner of all university medical schools. Despite its obscure origins, the school attained great fame in the eleventh and twelfth centuries and notably hosted acclaimed female professors of medicine such as Trota of Salerno (twelfth century). The school lost its leading role in medicine in the thirteenth century, when the universities of Bologna, Montpellier, Padua, and Paris opened their medical schools. In the fifteenth century, Ferrara also joined this select group (Siraisi 1990, 55).

The medical curriculum focused on the intellectual role of medicine, which, at the time, was conceived as “a diverse collection of areas of knowledge and of intellectual interests” (Siraisi 2012, 492). As such, it included various disciplines and developed a practical character embedded in a theoretical framework. This philosophical orientation explains the links that medicine established chiefly to the faculty of arts. In addition to some disciplines such as logic which had a clear preparatory nature with respect to medicine, other subjects in the arts curriculum sparked the interest of medical students. These were natural philosophy and astrology. Natural philosophy was conceived in Aristotelian terms and, due to its closeness to medicine, was regarded as directly useful for medical students, who also had to take astrology into account since it considered the influence of celestial bodies on the health and psychological condition of human beings (Siraisi 1990, 66–68). The basic texts adopted in the medicine curriculum were a series of Latin translations of treatises attributed to Greek authorities such as Hippocrates, Galen, and Aristotle. Due to the volume of this material, the teaching of medicine largely relied on compendia, abbreviated treatises, and Arabic medical works in Latin translation, especially Avicenna’s *Canon*. These texts, adopted throughout Europe, remained more or less the same until the second half of the fifteenth century, when humanists were able to produce more accurate Latin versions of Greek texts than the medieval ones, as well as translating newly recovered Greek texts, thus dramatically improving knowledge of classical medicine.

Heritage and Rupture with the Tradition

For decades, the universities of the Renaissance have been regarded as old-fashioned bastions of tradition. This questionable assumption was motivated by two factors. First, Renaissance universities stuck to a largely Aristotelian curriculum. By so doing, they delayed the appearance of modern science, whose emergence “is usually taken to be the results of throwing off the shackles of an old-fashioned Aristotelian worldview and its gradual

replacement. . . by a ‘new’ science” (Schmitt 1984, 35). Secondly, scholasticism, the predominant method adopted in university classes, has traditionally been considered to be an antiquated, dry, and orthodox system of thought. Scholasticism’s emphasis on the speculative sciences, its rigid and convoluted dialectic, and its deference to Aristotle have probably been exaggerated and have condemned it to a somewhat undeserved fate.

Although scholasticism occupied a central role in university learning, humanism also established a place for itself in universities’ halls. Humanism introduced crucial changes in every discipline taught in universities and contributed to the creation of new ones. The impact of humanism, which occurred throughout Europe, affected universities to different degrees. Humanist scholars and beliefs enjoyed a very different reception when they seeped into the academic environments and curricula of Northern and Southern European universities. The advent of humanism in Northern institutions led to rivalries between humanists and scholastics. Historians have offered different interpretations of these conflicts, portraying them as mere reflections of internal academic and personal antagonisms within the general coexistence of scholasticism and humanism or, alternatively, as the result of an unavoidable incompatibility between these two antagonistic systems of culture. Charles G. Nauert has compared the different positions, concluding that “the conflicts. . . may have been localized, personal, and muddled; but they reflect a disharmony that is fundamental. Conflict was not accidental; it was fated, irrepressible” (Nauert 1998, 432). Reciprocal criticism concentrated on a few major, and essentially intertwined, issues. Firstly, humanists and scholastics challenged each other’s methods. Humanists proposed an innovative approach to textual criticism, based on philological and linguistic skills, while scholastic claimed the validity of their established method of dialectical disputation and dismissively labeled humanist speculations as irrelevant *poetria* (poetical things). Along the same lines, scholastics and humanists quarreled over sources, with scholastics relying primarily on medieval commentators and humanists on classical authorities. Scholastic also criticized

humanists for their marked reluctance to accept texts as they were traditionally transmitted within the academic environment. This, of course, was a crucial matter when it comes to theology and sacred texts. Scholastics foresaw a potential danger of heterodoxy in the humanist treatment of religious texts. They argued that humanists, untrained in theological studies, should not be allowed to deal with the Bible and theological matters. Due to their lack of competence and qualification, humanists, in the opinion of scholastics, should not be allowed to approach scriptural texts. Humanists, for their part, attempted to rebut their opponents' claims. Erasmus of Rotterdam (1466?–1536), in particular, condemned scholastics for their focus on pointless questions, their neglect of the correct and original meaning of the Bible, their reliance on some ignorant medieval theologians, and their practice of extracting single passages out of their contexts and assuming them as the revealed truth (Nauert 1998, 431).

By contrast, the penetration of humanism into the Italian university environment happened with relative ease. Some key factors facilitated this process. Firstly, the lack of powerful faculties of theology prevented that potential impediment to the diffusion of humanism. Secondly, the higher degree of specialization in Italian universities hindered the emergence of conflicts between professors teaching different subjects. Normally Italian professors were expected to teach a narrow range of subjects and to stay within their subjects' traditional boundaries. Professors of rhetoric, for instance, could not teach medicine or law. Therefore, they could not pose a threat to members of other faculties. Lastly, the "notable people" who appointed new university professors normally belonged to families imbued with humanist culture and values. Consequently, they looked favorably on exponents of humanism, who also were often the most in-demand professors on the academic market (Lines 2006, 339–340). Initial contacts between humanists and Italian universities happened at a very early stage. The first humanists were usually students of law who pursued (but mostly did not obtain) university degrees: Petrarch (1304–1374) and Coluccio Salutati (1331–1406), for instance, both studied law in

Bologna. Still in the fourteenth century, Leonardo Bruni (1370–1444) studied law at the University of Florence until he abandoned university studies to dedicate himself to the translation of classical Greek works. Again in Bologna, Leon Battista Alberti (1404–1472) received a degree in canon law prior to 1428. This (still limited) interaction between humanists and the university has led scholars to reevaluate this complicated relationship and to reconsider the supposed aversion of humanists to universities.

At this stage, however, their participation did not bring about any significant modification to the university environment. This happened only when a substantial number of humanists served as university professors, assuming the responsibilities of teaching, running, and organizing courses. According to Paul Grendler, the growing involvement of humanists in Italian universities passed through a series of stages (Grendler 2002, 204–248). Until the first quarter of the fifteenth century, they were not tempted to teach in the universities, and when they opted for a teaching career, they preferred to train students in boarding schools. University posts were not particularly appealing as the subjects usually taught by humanists were still poorly paid and did not confer great prestige on those appointed to teach them. The case of Vittorino de' Rambaldoni (1378–1446), known as Vittorino da Feltre, provides a good example of the shared lack of interest in university posts. He was appointed in 1422 to teach grammar and rhetoric at the University of Padua, but he resigned shortly afterward, disgusted by the rude manners of his university students. He then moved to Venice and later to Mantua, where, for more than 20 years, he ran a boarding school (Ca' Gioiosa) open to young aristocrats. The next generation of humanists gradually began to apply for and hold university positions on a more consistent basis. By the first half of the fifteenth century, the major Italian universities appointed humanists and provided a larger forum for humanist studies. The growing impact of humanism within Italian society corresponded to a more stable presence of humanists within the university environment, which welcomed them rather benevolently. It is then

interesting to assess to what extent this general assumption applies to the notorious case of the troubled relationship between Lorenzo Valla (c. 1407–1457) and the law professors at the University of Pavia. He was appointed to teach rhetoric in Pavia in 1431. Following an initial friendly welcome from the other university teachers, the situation worsened dramatically in 1433, when Valla published a controversial pamphlet. The trigger to write it was a comparison made by one of the university jurists between Cicero and Bartolus of Sassoferrato, favorable to the latter. Valla rebutted this opinion, stressing the obscurity of Bartolus's language, the incoherence of his syllogistic reasoning, and his lack of philological skills. Quite consciously, circulating this piece of writing, Valla became the defender and the advocate of humanist culture, which was gradually gaining strength in Italian universities. According to his pamphlet, even a jurist had to develop humanist skills in order to be able to interpret and contextualize historical Roman law, to write eloquently in a refined and classical Latin, and to acquire the moral and linguistic skills of the Roman orator. Valla paid a heavy price for this polemical writing: although the actual course of the events is still hazy (as accounts differ on a few important details), it is known that he had to leave his teaching post and even the city to avoid the outrage of the local law professors (Speroni 1979). The case of Valla is interesting because the initial reception that he enjoyed confirms once more the positive attitude toward humanists in fifteenth-century Italian universities. The later hostile reaction against his controversial pamphlet, however, reveals the underlying tension between humanists and scholastics, prone to escalate into bitter disputes. In the period between the middle of the fifteenth century and the last quarter of the sixteenth century, humanist studies and humanists obtained a central position in Italian universities. Until the beginning of the *Cinquecento*, the two leading humanistically oriented institutions were the universities of Bologna and Florence. Bologna could boast a cohesive group of humanists, led by the eminent figure of Filippo Beroaldo the Elder (1453–1505). He was best known for his encyclopedic knowledge, which was greatly admired by contemporaries. He was

also very successful in his teaching, which he undertook from 1479. According to contemporary sources, his classes were packed with hundreds of students. He was a prolific writer and was among the small group of humanists who first conducted comparative and philological analyses of classical texts, breaking with the traditional commentary tradition. The philological method was later raised to a higher level by Angelo Ambrogini, known as Politian (1454–1494; Grafton 1977). He was appointed in 1480 as professor of poetics and rhetoric at the University of Florence through the direct influence of Lorenzo de' Medici, unofficial ruler of the city. The appointment of such a young and ambitious man, who was also one of the leading figures of the new generation of humanists, was intended to provoke a reaction in the Florentine academic establishment. This was led at the time by the eminent humanist Cristoforo Landino (1425–1498), aged 56, whose rather conservative teaching was beginning to appear outdated. While Landino's star was starting to slowly fade, Politian's star was rising: this is testified by the growth of his salary, which reached the very considerable amount of 450 florins in 1491–1492. In his teaching, he developed a radical philological approach, aimed at reestablishing the original (or the closest to the original) form of the classical work he was reading and commenting on. For his explanations, he mostly relied on earlier commentaries, which he often criticized in order to assert his own preeminence in this literary genre. From 1490 onwards, Politian applied his philological skills to Aristotle's *Nicomachean Ethics*, invading the traditional field of the philosophers. To counter the adverse reaction of his colleagues in philosophy, Politian devoted his 1492 inaugural lecture to arguing against them. He proudly claimed for himself the supposedly pejorative title of *grammaticus* ("grammarian"), which, according to him, meant that he possessed the necessary skills to read ancient works (in the original language), to restore them to their original form, and then to adopt these emended texts in place of the defective editions and the "barbarous" commentaries employed by philosophy professors (Mandosio 2008). Humanist influence declined in universities in the closing decades of the sixteenth century. The

proliferation of Jesuit schools, which offered free teaching in theology and humanist studies, partially accounts for this decline.

Innovative and Original Aspects

Much of the cultural innovation stemming from European universities is due to the influence exerted on these institutions by humanism. It played a decisive role in some of the crucial developments which took place in universities. Firstly, it contributed to changes in the relative positions of subjects within the hierarchy of the curriculum and even to the foundation of new subjects quite alien to the medieval curriculum such as botany, which emerged as a separate subject at the dawn of the sixteenth century. In the fifteenth century, the study of the healing properties of plants had been included in theoretical medicine. A major change occurred when humanists turned their attention to Dioscorides's *De materia medica* and Pliny the Elder's *Historia Naturalis*, both invaluable for the study of botany. Dioscorides's treatise was published in the original Greek by Aldo Manuzio in 1499 and was translated into Latin by the Venetian scholar Ermolao Barbaro (1453/1454–1492) in the 1480s, though published posthumously in 1516. The latter attracted a great deal of attention for its richness of botanical terminology – as well as for its textual errors. Botany then became an independent academic subject: the University of Rome was the first to found a lectureship in botany in 1514, followed by Padua in 1533 (Grendler 2002, 343–345). Gradually, the aims of the subject became more and more independent from medicine. Indeed, it evolved as its focus moved from the medical effects of plants to a broader knowledge of natural history. Possibly, the leading authority in this field was the Italian Ulisse Aldrovandi (1522–1605), who taught botany from 1556 until 1600 in Bologna. In addition to creating a botanical garden in 1568, Aldrovandi also collected numerous natural specimens and classified them according to scientific criteria.

Within that same field of the medical studies, developments in the study of anatomy were also a consequence of the humanist approach to the

subject. Anatomy was taught in Italian universities from an early age; however, after humanists focused their attention on Galen's works, (re) translated in more correct Latin in the first half of the sixteenth century, the study of anatomy changed radically. Galen's treatises enabled medical professors to gain a deeper understanding of the human body. Dissections became more frequent and more rigorous. The leading figure in this field was Andreas Vesalius of Brussels (1514–1564). He came into contact with the works of Galen at an early age, when he was a student in Paris and in Louvain. He was appointed by the Venetian senate as professor of surgery at the University of Padua in December 1537 with the express request that he undertake a systematic program of human dissection. His tireless efforts to improve research in the field of anatomy further led to the publication of *On the Fabric of the Human Body*, which he composed in parallel to his role as a translator of Galen. This monumental work, published in 1543 and in a revised edition in 1555, presented a comprehensive and exhaustively detailed overview of anatomical matters and, even more significantly, directly and polemically challenged Galen himself. In a similar way to Vesalius, other important anatomists were appointed by Italian universities, and finally, the University of Bologna established an ordinary professorship in anatomy in 1570 (Grendler 2002, 338).

Secondly, the spread of the humanist philological method moved beyond the traditional boundaries of humanist studies and contributed to transforming and overhauling many subjects. The great Milanese jurist Andrea Alciato (1492–1550) is regarded as the first to apply humanist methodology to the study of law. He trained in Pavia and Bologna and graduated from the University of Ferrara. Despite his Italian education, he spent about 10 years in French universities (Avignon and Bourges) as a university professor, before returning to teach for 17 years in Italian universities (mostly at Pavia). His main aim was to reform legal education through application of humanist skills, usually regarded with hostility by jurists. Alciato's rethinking of law studies was based on two humanist principles: the development of a
